THE AUTOMOBILE

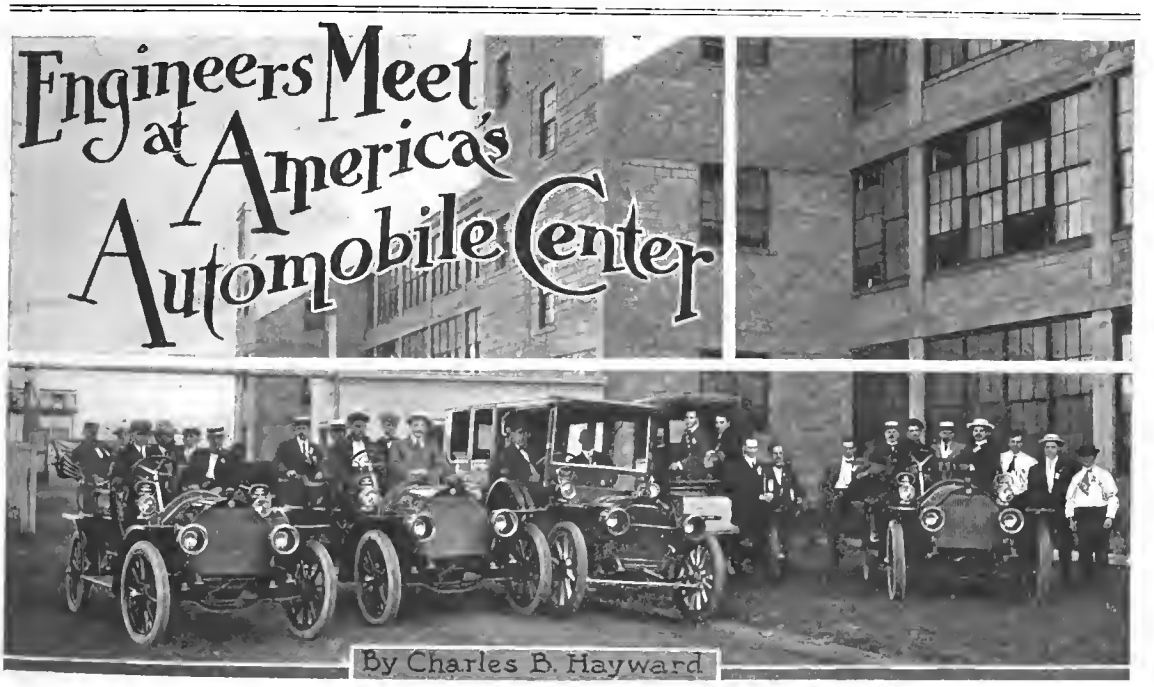
Engineers Meet at America's Automobile Center



By Charles B. Hayward

Engineers Looking Pleasant at the Fine New Plant of the Chalmers-Detroit Company.

DETROIT, June 27.—With the conclusion of the luncheon tendered the visiting technical men by Messrs. Russell and Rumney, of the Detroit Steel Products Company, at the Detroit Boat Club on Belle Isle, and the technical session and business meeting which followed it, there came to an end the most successful gathering that the Society of Automobile Engineers has ever had in its existence of three years. It was the Third Annual summer meeting and was scheduled for Thursday, Friday, and Saturday of this week, but the widespread interest manifested in the occasion became evident very early as the automobile builders and designers, as well as their technical confrères in the accessory field, began to drop in at the Hotel Tuller headquarters on Wednesday afternoon, and as shown by the Society register, there were representatives from Coast to Coast, arrivals from Boston and Los Angeles coming in close proximity, while practically every important automobile manufacturing center east of the Mississippi contributed its quota of talent.

As the result of the untiring efforts of H. E. Coffin, chairman of the Detroit entertainment committee, and his co-workers, James H. Herron, Russell Huff, Henry Ford, and Alanson P. Brush, everything was in complete readiness for the visiting engineers. Owing to the most cordial invitation of the American Society of Mechanical Engineers to participate in all and any of the numerous entertainments provided by the local committee of that body and extended to the automobile engineers by President Holman and Secretary Rice of the A. S. M. E., it was impossible to definitely outline the entire program in advance. After conferring with Messrs. Coffin, Herron and Huff, of the local committee, it was decided to schedule the papers by E. S. Foljambe on "Autogenous Welding in Automobile Construction," and by Otto Heins on "Some Recent Developments in Magneto Ignition with Special Reference to the Bosch System," for Thursday night instead of devoting an entire evening to each, in order to be able to take advantage of the very kind invitation of the Mechanical Engineers to take part in their excursion to Bois Blanc island, at the mouth of the Detroit river, on Friday afternoon.

The first thing on the program Thursday morning was attendance at the launching of the huge lake freighter, Daniel B. Meachem, the invitation of the Great Lakes Engineering Works to the Mechanical Engineers having been extended by the latter to the automobile fraternity. The steamer "Britannia" left the Third street dock, loaded to the rails, and proceeded down the river to the shipbuilding plant. The 10,500-ton cargo carrier was slid off the ways laterally and plunged into her native element with what was scarcely a ripple, considering her huge bulk, though some of the engineers and their ladies whose curiosity led them too near found the wavelet real moist when it caught them unawares.

Thomas-Detroits Which Took Visitors to Grosse Point.

The automobile contingent was met at the dock on the return of the "Britannia" by a number of cars kindly tendered for the occasion by the Thomas, now the Chalmers, and the Packard factories, and were taken out to Dobson's, where one of the typical frog-leg and chicken dinners for which Detroit is so justly famous was served at the invitation of the Society. Following this, the members were treated to a view of the long line of beautiful residences that front on Lake St. Clair. The ladies of the auto engineers' party were then left at the Detroit Country Club for afternoon tea with the ladies of the A. S. M. E., at the invitation of Mrs. Dow, head of the ladies' entertainment committee, the engineers themselves proceeding to the Thomas plant, where they were welcomed by Mr. Coffin and his right hand man, J. G. Utz, and R. G. Chapin, treasurer of the company.

Naturally, the chief object of interest was Mr. Coffin's new production, the Chalmers-New-Detroit, upon which he and Mr. Utz have been working for a year or two past, one of the cars having been on the road since last October, but which has been kept so very quiet that none outside of the shop had the faintest inkling of the new and startling development until its creators were ready to take the lid off, for the car that had been on the road all that time was most effectively disguised with a huge body and tool box.

Expressions of surprise and admiration at the many ingenious and novel features incorporated in the car by Mr. Coffin, such as its block motor, integral manifolds, with power plant and transmission on three-point suspension, single pedal clutch and brake control, were universal. The light and airy buildings of the new Chalmers plant with their high ceilings, white walls, and immense stretches of glass, also came in for unstinted approval, while the many kinks of shop practice introduced by Mr. Coffin and his assistants to facilitate manufacturing, and particularly the assembling of the cars, brought forth much commendation. After looking pleasant for the ubiquitous man behind the camera, Mr. Benham—and who could not look pleasant in Detroit, where as expressed by the motto on the reverse of the souvenir fobs presented by the local committee, "Life is worth living"—the engineers were whisked across town to the Ford plant.

On the "Britannia" at the Invitation of the A. S. M. E.

The men who design and build cars and their parts had already been treated to more than one surprise, but here indeed was a genuine eye-opener that made every optic literally bulge. The very atmosphere of the plant seemed to spawn Ford runabouts and roadsters—they were here, there, and everywhere, wherever one looked he saw Fords, not in ones and twos, but in flocks. Under the kind guidance of Mr. Wills, the factory superintendent and technical head of the plant, the engineers were treated to a comprehensive view of the system that makes a Ford "every six minutes of every working day," a possibility. But it was not in the ingenuity displayed in the numerous methods of machining and assembling the eighty odd cars that constituted a day's output, that drew open-mouthed admiration, as it was the spirit of the workmen. "Man alive, they actually run and jump to grab the pieces to put them together," remarked one of the experienced visiting designers to a confrère. Wherever one looked, the men were finishing parts and building Ford cars from the ground up, as if their very existence depended upon finishing the task in hand. But when they came to the next job, it was the same story of high pressure and sustained tension. "Every man in the place must be on piece work," was the opinion voiced by an old hand in shop practice and management, but a request for enlightenment on the subject made later to James Couzens, treasurer of the Ford Company, proved this not to be the case. "It's the Ford spirit," said Mr. Couzens, and the men who had seen its working realized for the first time that it was the intangible thing that the Frenchmen have so aptly termed *esprit de corps* that made possible the manufacture of more than 17,000 cars in less than two years.

President Fay and Manager Newman Confer.

"We're practically cleaning up this series now," remarked Mr. Wills to an inquiry. "But what are these endless stacks of finished motor units that cover every part of the floor?" asked the questioner. "Oh, those will all be out of here in six weeks or so," said the Ford engineer, adding in a most nonchalant way, "We have only about 2,000 cars left to build." The shutdown whistle for the day found the visiting engineers in the testing room of the plant where two long rows of motors running at full speed made conversation utterly impossible. This was practically the only department in which the long-drawn-out blast of the whistle caused the men to hustle for the wash basin, but anyone who had been testing Ford motors all day was entitled to the privilege. In the other departments, many kept right on working until the rush to wash was through.

In the evening, the first paper scheduled was that on autogenous welding, but owing to some delay in setting up the apparatus for the demonstration, which had been kindly supplied by the Davis-Bournonville Acetylene Development Company of New York, and the Linde Air Products Company of Buffalo, the

paper on "The Storage Battery in Automobile Work," by Bruce Ford, was read and discussed at some length. Mr. Foljambe then gave a brief résumé of his paper on autogenous welding, describing in a few words the apparatus necessary and the method of employing it for both welding and cutting, outlining in addition a few of the many possibilities that this process holds for the automobile builder, such as welding frames and other parts where the original construction of the car is concerned, beside its extremely widespread adaptability to the repairing of broken parts on the car, particularly aluminum and iron castings, as it is easily possible to weld any two or more dissimilar metals, the strength of the joint approximating very closely to that of the original piece before breaking.

Several drop-forged pieces, such as a connecting-rod, which had been cut in half for the purpose, were then quickly put together by Mr. Brunning, a representative of the Linde Air Products Company, the time required not exceeding two or three minutes, even with the meager facilities at hand for holding the work, although in the case of the drop-forged connecting-rod, the remarkable localization of the heat was manifested by the fact that in this eight or nine-inch piece of metal it had not extended sufficiently far from the weld to make it unbearable to the naked hand at the ends and it was possible to pick up the piece without discomfort. A large motor cylinder which had been supplied by Mr. Northway, a member of the Society, for the purpose, was then made good by welding up a four-inch cut that had been made in its water-jacket, strikingly demonstrating the value of the process for repairing castings. But for the possibility of sealing the gap in question in this manner, this cylinder would have been a waster if new, or would have required a replacement, had it broken in this manner in service, but it was made good in less than five minutes, although it is customary on a piece of such size to preheat the whole cylinder in order to avoid setting up internal strains in the metal. Then came the crucial test of the process for one branch of work—that of cutting metals. Mr. Herron, of the local committee, had furnished a slab of 60-point carbon steel a foot or more in length, four inches wide and 1 5-8 inches thick. The object of the demonstration was to show how readily a crankshaft form could be cut from the solid slab and to facilitate turning at the corners, holes had been drilled at those spots. The makeshift nature of the apparatus employed for the test may be appreciated when it is stated that a Prest-O-Lite tank was impressed into service to furnish the acetylene gas. Less than ten minutes were required to cut the top and one side of the crank outline and the efficiency of the process for the purpose having been satisfactorily shown, the demonstration was halted and the subject laid open for discussion. Owing to the extremely wide range of questions that could be brought up, it was decided to request written discussions from the members. A number of the A. S. M. E. members attended this session, the meetings of both societies having been thrown open to the members of both the visiting organizations.

Mr. Heins then read a paper on the subject of "Recent Developments in Magneto Ignition," which was profusely illustrated by lantern slides showing various phases of the develop-

Facing the Camera in Front of the Administration Building of the Fine Plant Where Packards Are Built.

ment of the ignition of the internal combustion motor since the earliest days, then taking up the magneto itself and showing the course of its development in the last eight or ten years to its present high state of perfection. He also compared the efficiency of the coil system of ignition with that of the magneto, as well as that of different types of magnetos, each point being graphically brought out by the use of lantern slides. Mr. Heins' paper also covered such a wide range that it was difficult to discuss it at any length in the time available, and written discussions were accordingly requested. A more detailed report of Mr. Heins' lecture will be found in connection with the transcript of his paper which appears in this issue of THE AUTOMOBILE.

Friday morning, the automobile engineers attended the meeting of the American Society of Mechanical Engineers at the request of the latter, in order to participate in the continued discussion of the paper by Henry Souther on "Clutches." In the absence of Mr. Souther, Secretary Hayward of the S. A. E. was called upon to lead the discussion, consisting of a brief outline of the points brought out by Mr. Souther in his paper. President Fay was then requested to enlighten the mechanical engineers as to some points of automobile clutch design, which he did by calling attention to some of the essential points of the

Chairman Coffin at the Wheel of the Chalmers-New-Detroit.

good clutch as developed during the past several years of experience on the automobile.

Cadillac Plant Came in for Inspection.

Immediately upon the conclusion of this session, the auto engineers were carried in a string of Cadillac cars to visit the plant where the latter are built. This was done at the special invitation of Mr. Leland, head of the Cadillac company, and, realizing that the time available for the visit was limited, the visitors were sent through the plant under the guidance of Messrs. Sweet, Johnson and the other members of the Cadillac technical staff in groups of five, each group making a systematic tour of the whole plant by starting out in a different direction. To the engineer, the most impressive feature of the whole Cadillac plant is its thoroughly worked-out system of manufacturing every part of the car. Although cars were being turned out in large numbers, everything was going along in the most orderly manner, and there were no symptoms of unusual bustle or hurry. But more than this was the striving after the greatest possible accuracy wherever needed that was manifest in the construction of every part so that a Cadillac could be said to be interchangeable in every respect without the necessity of the slightest fitting or alteration, and probably there are few plants that have carried systematic accuracy to the same extent as in the case of the builders of the Cadillac. After having stood for the camera man again, the engineers were whisked over to the Cadillac foundry and their visit was opportunely timed, as the pouring was just under way.

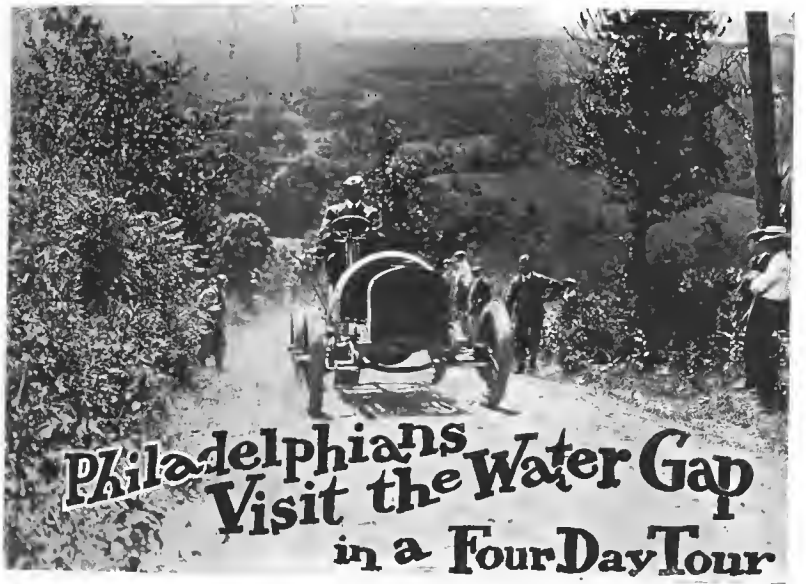
From the Cadillac plant, the automobile designers were taken in the cars to the foot of Bates street, where the steamer Brittania was again boarded at the invitation of the local committee of the A. S. M. E., headed by Mr. Dow, for a run down the river to "Baa Blow" (Bois Blanc) island, where dinner was served in the casino, the steamer bringing the party back about 10 P.M., after the end of the second strenuous day. The next morning, the new plant of the Detroit Steel Products Company was visited in a number of Packard cars and the ubiquitous Woods electric of Newman, who always managed to find his way round town on time, and from the Steel company's plant the cars were again taken for the last factory visit of the meeting, that to the Packard plant. The latter now covers some 12 acres of floor space and is reputed to have no less than 18 miles of rooms in its numerous large buildings, so that the visit was confined to the most interesting departments of the huge factory. A start was made in the testing laboratory, in charge of Daniel Huff, brother of the Packard company's chief engineer, and the action of the 200,000-pound testing machine was shown for the benefit of the visitors on a piece of strap-iron of 1-4-inch thickness. After a trip through the beautifully fitted administration building, the visitors were then conducted through the numerous manufacturing departments and shown the various processes in the building of Packard touring cars and trucks, the running and testing departments coming in for particular attention at the hands of the sharps owing to the extreme thoroughness with which the Packard system of inspection is carried out there. In addition to the Messrs. Huff, who acted as guides, Ralph Estep, the Packard publicity man, and Allen Loomis, one of Mr. Huff's staff, aided by other assistants from the engineering force, piloted the engineers through the plant so that every department of interest was covered by the time the shut-down whistle sounded at 11:30.

Final Session Held on Belle Isle.

A number of Packard and Thomas cars were then impressed for a drive round Belle Isle, ending up an hour later at the Detroit Boat club for the lunch tendered the Society by J. G. Rumney of the Detroit Steel Products Company. The occasion was a most enjoyable one, and Mr. Russell, president of the same company, felicitated the engineers on their visit to Detroit, getting off numerous quips at the expense of those whom he knew personally. The lunch was followed by a business session, at which it was decided to make Cleveland the next place of meeting, the date to be between September 20 and October 10, the exact days to be set by the committee on meetings in conference with the council.

In the absence of Frank Beemer abroad, his paper on the "Unit System of Power Transmission in Automobiles" was read by Secretary Hayward, the brief abstract given of the principal points of Mr. Beemer's arguments for the transmission axle leading to an interesting discussion during which numerous points of value were brought out. This was followed by A. L. Dixon's paper on the "Increased Efficiency of Single Motor Drive," which, owing to the fact that it consisted principally of tabulated data, was read by title, written discussions being promised on both this and several of the phases of Mr. Beemer's subject. The meeting was then adjourned to reconvene in Cleveland three months later, the dates falling somewhat in the fortnight consisting of the last week in September and the first week of October, this being decided by the council and committee on meetings.

Among those present were: Thomas J. Fay, H. M. Swetland, J. W. Cain, R. E. Northway, James H. Herron, J. Wilson Drown, Ernest L. Smith, E. S. Foljambe, John H. Thompson, H. M. Jerome, Marcel de Jarny, George McLean, Russell Huff, Daniel Huff, Allen Loomis, Bruce Ford, H. Vanderbeek, H. K. Holsman, H. B. MacFarland, J. O. Heinze, B. G. Ellis, G. L. Chandler, Robert C. Shoel, G. E. Franquist, F. J. Newman, P. H. Shearer, E. F. Schnuck, George W. Sargent, W. G. Wall, G. B. Norcross, J. A. McMichael, J. W. Bate, Otto Heins, M. H. Ferrell, F. E. Watts, L. Charles Kenen, W. S. Noyes, C. H. Westen, P. J. Brennan, Francis S. Thompson, V. Oldberg, J. E. DuBois, George L. Fish, Courtland D. Cramp, Marius C. Krarup and Charles B. Hayward, Secretary of the Society.



Philadelphians Visit the Water Gap in a Four Day Tour

The Rambler That Was a Three-time Winner During the Tour.

STROUDSBURG, PA., June 30.—While last week's first annual carnival of the Monroe County Automobile Club was not exactly a howling success, it demonstrated the possibilities of such an affair as a medium for attracting automobile visitors to this charming mountain section.

"Jack" Hiscock, the Philadelphia newspaper man who boomed the affair, labored diligently, and but for his efforts the whole thing might have fallen through. Those who took part in the carnival, however, are delighted with their experience—as well they might be, for they were treated like princes.

Story of the First Day's Run.

STROUDSBURG, PA., June 24.—To-day's double header endurance run from New York and Philadelphia to this place was disappointingly meager to the management of the affair. Less than a dozen cars came from the Quaker City, and none at all from Gotham. THE AUTOMOBILE representative had a seat in the Studebaker Navy Dispatch car, driven by Frank Yerger.

A heavy thunderstorm delayed some of the rear cars, several trees having been blown down across the road between Easton and Delaware Water Gap. The length of the route on which the committee set a time limit of 4 hours 24 minutes was 88 miles, and was laid out via Willow Grove, Doylestown, Easton, Portland and the Gap to Stroudsburg. Following is a summary:

CLASS A.

			Penalties			
			Road	Tech.	Total	Cause of Tech. Penalization.
8.	Elmore 30-35	Hardart ..0	0	0		
6.	Mitchell 35	Cram 0	5	5		Leaky Radiator.
10.	Thomas 60	Magraw ..10	0	10		
*4.	Studebaker 80	Yerger ...12	0	12		

*Yerger entered protest against his penalty of 12 points, having been illegally held up 15 minutes in Doylestown by the local police, and afterwards released with an apology.

CLASS B.

2.	Thomas-Detroit ..40	Stetson ...0	0	0		
7.	Autocar 24	Brown 0	2	2		Smashed universal joint boot.
13.	Packard 30	Simonin 194	0	194		

CLASS C.

3.	Ford 15	White 0	0	0		

Second Day Was the Hill-climb.

STROUDSBURG, PA., June 25.—The paucity of entires spoiled the hill-climb at the Water Gap to-day. The program was completed in something less than an hour. The scene of the climb which is called Gulick Hill, is a cross-road connecting the Cherry Valley and Foxtown roads. It is a trifle over 5,000 feet long, and the first 300 yards are the most difficult of the course—with a grade closely approaching 20 per cent. running straight up.

The start was from in front of the "Cherry Creek Farm," an ancient hostelry which has acquired fame (since the climb) for its hard cider and ice-cold spring water. The platform on which the officials were perched at the finish fairly overhung the deep valley, the view across which to the Delaware Water Gap elicited complimentary adjectives as to the artistic instincts of the promoters.

The feature of the day, which was to have been the upward flight of Levey's 120-horsepower Hotchkiss in the free-for all, came as near as a hair to being a tragedy, but, fortunately, "Jud" Kilpatrick, its driver, had his noddle with him, and when he swung to the outside on the last sharp turn and dashed into an upright of the stout fence erected as a protection to travelers at that point, he shut off his engine and managed to stop the car, without injury either to himself or to his mechanician, Stephen Carusso, although the latter was catapulted about 20 feet ahead of the car when it struck. The only visible injury to the flyer was the bending of the left end of the front axle, the top of the wheel standing out at an angle of 45 degrees as the Hotchkiss hobbled painfully past the finish on her way to the hospital in Stroudsburg.

The mishap to the Hotchkiss gave a walkover victory for the free-for-all honors to the Zust "40," driven by Jules Berigne, which negotiated the hill in 1:57.

Strange to say, the free-for-all winner's time was badly beaten in the $1,251 to $2,000 gasoline event, when the stripped Rambler "24," owned and driven by W. H. Pierce, made the trip in 1:46 2-5, the runner up, Bert Clark's 65-horsepower Jackson also beating the Zust's time by an even five seconds.

Jules Berigne's Zust "40" also had a walkover in the $4,001-and-over class, with a voyage in 2:04. The summary:

GASOLINE STOCK CARS, $851 TO $1,250.

36.	Buick 22	H. D. Church 2:13 2-5	
37.	Jackson 24	J. A. Rutan.....2:20	

GASOLINE STOCK CARS, $1,251 TO $2,000.

39.	Rambler 35	W. H. Pierce 1:46 2-5	
38.	Jackson 35	Bert Clark 1:52	

STEAM OR GASOLINE STOCK CARS, $2,001 TO $3,000.

4.	Studebaker 30	Frank Yerger 2:23 2-5	

Where the Officials Were Located on Pocono's Summit.

The Pennsylvania That Won in the Third Day's Event.

Kilpatrick Driving the Hotchkiss Up Old Pocono.

GASOLINE STOCK CARS, $4,001 AND OVER.

47.	Zust	40	Jules Berigne	2:04

FREE-FOR-ALL.

47.	Zust	40	Jules Berigne	1:57
42.	Hotchkiss	120	J. Kilpatrick....Damaged in collision.	

Third Day Brought Out the Speeders.

STROUDSBURG, PA., June 26.—The scene shifted to-day to Pocono summit, where a fair mile straightaway had been laid out. The course was rolling, however, and the star card, Levey's Hotchkiss, was unable to show its best paces. Kilpatrick drove the big smoke to the course record of :48 3-5, the only other car to get under the minute being the Pennsylvania "50," driven by J. Brown, which did :59 1-5 in the free-for-all, and captured another event in :58 3-5. The stripped Rambler, which made the fastest time in the Water Gap climb, again won in its class —15:1 to 24-horsepower gasoline cars—in 1:16 3-5, beating out the Buick and the Stevens-Duryea. Summary:

GASOLINE STOCK CARS, 15.1 to 24-H.P., INCLUSIVE.

39.	Rambler	24	W. H. Pierce	1:16 3-5
36.	Buick	18	H. D. Church	1:23
49.	Stevens-Duryea		J. Lee	1:27

SPECIAL EVENT.

87.	Jackson	24	W. Smith	1:16 1-5

FREE-FOR-ALL.

42.	Hotchkiss	120	J. Kilpatrick	:48 3-5
46.	Pennsylvania	50	J. Brown	:59 1-5
43.	Thomas	60	Harry Jones	1:07 2-5
47.	Znst	40	Jules Berigne	1:13

GASOLINE STOCK CARS, TOTAL PISTON AREA NOT EXCEEDING 103.87 SQUARE INCHES (BRIARCLIFF MODELS ELIGIBLE).

46.	Pennsylvania	50	J. Brown	:58 3-5
43.	Thomas	60	Harry Jones	1:03 3-5

In the afternoon hill-climb for amateurs, which was held at Canadensis, five miles across the mountains from Pocono summit, the feature once more was the Hotchkiss, which in a special event arranged for that car and the Pennsylvania, beat out the latter by a good margin, its best time in three trials being :23 1-5 as against the Pennsy's :27 3-5. The event of the afternoon, the free-for-all, was a walkover for A. R. Allen's Thomas, time :32. The Thomas later did :30 flat. Summary:

SPECIAL EVENT FOR HILL RECORD.

42.	Hotchkiss	120	J. Kilpatrick...	:24; :23 1-5; :23 2-5
46.	Pennsylvania	50	J. Brown	:28; :27 3-5
43.	Thomas	60	Harry Jones	:30

GASOLINE STOCK CARS, $851 TO $1,250.

37.	Jackson	35	J. A. Rutan	:42

GASOLINE STOCK CARS, $1,251 TO $2,000.

39.	Rambler	24	W. H. Pierce	:34 2-5
38.	Jackson	35	B. Clark	:38 2-5

GASOLINE STOCK CARS, $3,001 TO $4,000.

50.	Stevens-Duryea	35	T. J. Kitson	:34 2-5
44.	Stevens-Duryea	35	A. G. Scott	:34 3-5
51.	Stevens-Duryea	35	W. C. Snover	:40
52.	Stevens-Duryea	35	W. B. Easton	:41

FREE-FOR-ALL.

43.	Thomas	60	Harry Jones	:32

OPEN ONLY TO MEMBERS OF MONROE COUNTY AUTOMOBILE ASSOCIATION.

50.	Stevens-Duryea	35	T. J. Kitson	:34
36.	Buick	22	H. D. Church	:43 2-5
45.	Maxwell	28	W. C. Snover	47 2-5

Fourth Day Was the Wind-up.

STROUDSBURG, PA., June 27.—The carnival rounded up this afternoon with a gymkhana on the half-mile track at the Monroe County Fair Grounds. Again the mighty Hotchkiss featured, Kilpatrick taking chances in driving his car to the track record of :35 3-5.

The driving a-mile-at-the-rate-of-ten-miles-an-hour event was won by J. D. Smith in a Jackson, H. R. Worthington, in a Benz, being the next best guesser, and D. H. Gaines, in a Zust, the third.

Stevens-Duryea That Won Twice on the Third Day.

Elmore That Won the Cup in Class A on the Run.

HOW THE AUTOS CLIMBED SKIPPACK HILL

NORRISTOWN, PA., June 30.—That the "Willie" Haupt-Chadwick combination is the fastest thing in the hill-climbing line in this country if not in the world, was demonstrated last Saturday afternoon at the first annual hill-climb of the Norristown Automobile Club on Skippack Hill, a one and one-fifth mile, 3-to-10 per cent. grade, some five miles north of this town. Haupt twice cleaned up a big field by a big margin, and in his last trial he pushed his Great Chadwick "Six" to the limit and registered :57 2-5—a record which, by the way, he says he can better. A little figuring will show that this time represents a 75-mile-an-hour clip, and on the level stretch just beyond the finish he says his speedometer showed 80 miles. In his first official trial, in the gasoline free-for-all, he just missed getting under the minute—1:01, which is going some—up hill.

Haupt and His Record-breaking Chadwick.

There were three score trials at the hill, and the times made in all classes were very fast. While there was some little delay, due to the overcrowding of the course at the finish, the management of the whole affair reflects great credit on the hustling organization which promoted it. All hands worked like beavers, and, when the inadequate policing is taken into consideration, the promptness with which the program was run off was highly commendable. Fully 15,000 people lined the course, which had been oiled and was lightning fast.

The Chadwick had the same gearing as at Wilkes-Barre, but, whereas Haupt used his second (2.6) and third (3.9) speed there, here he relied entirely upon his high gear (1.9). All the events but the free-for-alls were from standing starts. In the big races the entrants went a couple of hundred yards up the hill on the other side of Skippack Creek to get a start, and the difference between the two styles was worth from 15 to 20 seconds.

The hill is 6,270 feet long, 352 feet high, and almost a straight-away, there being one slight bent about a third of a mile from the start. One bad feature of the course, however, is the trolley line which parallels it, the tracks crossing from one side to the other about midway of the hill. The cars of this line were in operation throughout the contest, but men with big red flags were on duty all the afternoon, and no hold-ups or accidents occurred. A liberal treatment of "Asphaltoilene" had laid the dust and rendered the going superb.

At the top of the hill, from which, by the way, seven counties may be seen, the grandstand and judges' stand were erected, on the right ascending the hill. The timing system was something new in that line, having been invented by a Norristowner named Ballard. At start and finish a rubber hose filled with water was used instead of the usual tape. The pressure of the tires on the hose forced the water upward and effected an electrical contact which rang a bell both at start and finish. The bells were a trifle weak, however, and had to be listened for attentively by the timers in order to avoid a mistake. More current and louder bells would make the system a good one.

A half dozen State constabulary, one or two Norristown policemen and several club members armed with badges and sticks tried to keep the course clear, but it was not until the grandstand was thrown open to the public free of charge that they succeeded. That no accidents resulted was due in large measure to the officials, who, armed with megaphones, kept the crowd on the *qui vive* with their "car coming."

Aside from the overshadowing Chadwick performances, the hit of the day was made by the Knox "30," driven by William Bourgue. Although listed at $2,600, it won the $4,001-and-over class from such stalwarts as a pair of Apperson "55's" and two Stearns "60's," finished next to the Chadwick in the gasoline free-for-all, ahead of several cars costing twice as much, and captured fifth place in the big free-for-all. Earlier in the day, while competing in its own ($2,001 and $3,000) class, Bourgue stopped before reaching the finish and returned and asked for another start. There was an immediate protest from all hands, but he was allowed to start, nevertheless, and made the best time in the class, 1:33 3-5. The officials, however, upheld the protest, and the Knox, having failed to reach the finish on its official trial, is credited with being "stalled," the race going to the Pennsylvania "50," with Zengle driving, in 1:36. The Pennsy also captured the $3,001 to $4,000 class in 1:38 2-5, just nosing out A. C. Miller and his Stoddard-Dayton by one-fifth of a second.

Bourgue and His Knox That Won in Its Class.

The Overland "24," driven by J. Brockway, won the $851 to $1,250 class in 2:11, but was beaten out by the Jackson "35," W. J. Hays, Jr., up, in the $1,251 to $2,000 gasoline class. The Jackson was the first car to get under the two-minute mark—1:53.

The first car to climb the hill in the gasoline free-for-all was Bourgue's Knox "30," and when the time, 1:15 4-5, was hung out, there were great expectations entertained of what the big fellows would do. But not one of them could get under the

Brockway's Overland Capturing the Second Event.

little Knox's figures until the Chadwick did the trick in 1:01. Even the mighty Matheson, the ponderous Pennsylvania, the sturdy Stearns and the active Apperson failed, while the less powerful cars seemed to be out of it entirely. There were many mutterings, head-shakings and inquisitive glances cast at the light gray flyer by the unsuccessful ones as it lay in the paddock waiting for the next event, but it played in second place to the Chadwick alone of all its opponents.

In the final free-for-all, however, after Bourgue's Knox had done 1:16 2-5, and the charging Chadwick had buried the hopes of all the others with its :57 2-5, Al. Dennison's Knox "48" got under its little brother's time with a 1:13 2-5 journey, and later Joe Parkin, Jr., drove his Parkin "60" to a 1:16 trip, which was duplicated a few minutes later by Harry Goodin in his "Sixty" Stearns. The summary, which includes a very representative list of cars, follows:

GASOLINE STOCK CARS, $850 AND UNDER (STANDING START).

1.	Buick	18	$850	C. W. Mann	2:16 1-5
2.	Ford	18	600	J. F. Graham	2:23
3.	Ford	18	700	R. S. Heebner	2:35 3-5
4.	Buick	18	850	J. K. Lewis	2:58
5.	Buggy runabout	14	680	B. Applegate	3:40 1-5

GASOLINE STOCK CARS, $851 TO $1,250 (STANDING START).

1.	Overland	24	$1,250	J. Brockway	2:11
2.	Buick	18	850	C. W. Mann	2:16 3-5
3.	Mitchell	20	1,000	B. F. Stritzinger	2:31
4.	Reo	20	1,025	H. Greenwood	2:38 1-5
5.	Auburn	22	1,250	H. W. Trump	2:44

GASOLINE STOCK CARS, $1,251 TO $2,000 (STANDING START).

1.	Jackson	35	$2,000	W. J. Hays, Jr.	1:53
2.	Overland	24	1,250	J. Brockway	2:05 3-5
3.	Oldsmobile	35	2,000	Tom Berger	2:15
4.	Mitchell	35	2,000	B. F. Stritzinger	2:26

GASOLINE STOCK CARS, $2,001 TO $3,000 (STANDING START).

1.	Pennsylvania	50	$3,000	L. Zengle	1:36
2.	Stoddard-Dayton	45	2,700	A. C. Miller	1:38 2-5
3.	Jackson	35	2,000	W. J. Hays, Jr.	1:41 2-5
4.	Columbia	29	3,000	J. J. Coffey	1:46 1-5
5.	Ford	40	2,800	L. C. Block	1:54
6.	Crawford	50	3,000	T. M. Twining	2:05
7.	Acme	30	3,000	R. H. Morris	2:07 1-5
8.	Crawford	40	3,000		2:47 1-5
9.	Crawford	50	8,000	R. S. Crawford	3:57 3-5
10.	Knox	30	2,500	W. Bourgue	*Stalled
11.	Cadillac	30	2,500	J. E. Lee	Stalled

*Started again under protest and climbed the hill in 1:33 3-5, but protest was sustained.

GASOLINE STOCK CARS, $3,001 TO $4,000 (STANDING START).

1.	Pennsylvania	50	$3,000	L. Zengle	1:36 2-5
2.	Stoddard-Dayton	45	2,700	A. C. Miller	1:38 3-5
3.	Pope-Toledo	40	3,500	Alan Wood, 3d	2:10

GASOLINE STOCK CARS, $4,001 AND OVER (STANDING START).

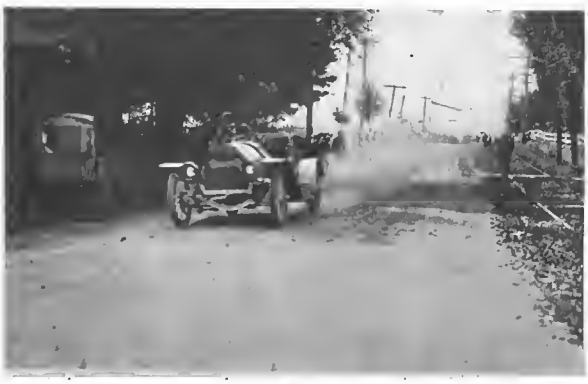
1.	Knox	30	$2,600	W. Bourgue	1:33
2.	Apperson	55	5,000	C. J. Swain	1:37
3.	Apperson	55	5,000	George Davis	1:38 3-5
4.	Stearns	60	4,600	Harry Goodin	1:40 3-5
5.	Parkin	50		Joe Parkin, Jr.	1:48
6.	Stearns	60	4,600	J. F. Betz, 3d	1:48 4-5

FREE-FOR-ALL GASOLINE CARS (FLYING START).

1.	Chadwick	50	$6,500	W. Haupt	1:01
2.	Knox	30	2,500	W. Bourgue	1:15 4-5
3.	Knox	48		Albert Dennison	1:16
4.	Stoddard-Dayton	45	2,700	A. C. Miller	1:18
5.	Parkin	60		Joe Parkin, Jr.	1:18 3-5
6.	Matheson	60	6,000	H. N. Harding	1:19 3-5
7.	Pennsylvania	50	8,000	L. Zengle	1:20
8.	Stearns	50	4,600	Harry Goodin	1:21
9.	Oldsmobile	40	2,750	Tom Berger	1:21 3-5
10.	Columbia	29	3,000	J. J. Coffey	1:23
11.	Apperson	55	5,000	C. J. Swain	1:25
12.	Apperson	55	5,000	George Davis	1:27
13.	Ford	15	600	A. A. Jones	1:50

FREE-FOR-ALL (FLYING START).

1.	Chadwick	50	$6,500	W. Haupt	:57 2-5
2.	Knox	48		A. Dennison	1:13 2-5
3.	Parkin	60		Joe Parkin, Jr.	1:16
4.	Stearns	50	4,600	Harry Goodin	1:16
5.	Knox	30	2,500	W. Bourgue	1:16 2-5
6.	Stoddard-Dayton	45	2,700	A. C. Miller	1:17
7.	Pennsylvania	50	3,000	L. Zengle	1:18 2-5
8.	Matheson	50	6,000	H. N. Harding	1:20
9.	Oldsmobile	40	2,750	Tom Berger	1:22 1-5
10.	Apperson	55	5,000	George Davis	1:23 3-5
11.	Apperson	55	5,000	C. J. Swain	1:24
12.	Jones-Corbin	50		J. Jones	1:52



Zengle in Pennsylvania That Won Two Events.

TWO PACKARDS TIED FOR HAGERMAN CUP.

St. Louis, June 27.—The second annual owners' reliability tour for the James Hagerman, Jr., trophy, which was conducted by the Automobile Club of St. Louis, took place to-day. It resulted in two 30-horsepower 1908 Packards finishing with perfect scores. One was owned and driven by G. E. J. Walsh and the other by Samuel Plant. Both of these contenders also finished last year with no penalizations against them. In accordance with the rules of the tour, which provide that the trophy shall become permanent possession of any one winning it twice in succession, there is a tie between these two for the final ownership of the trophy. The manner of running off the tie will be decided later by a committee selected by the referee.

Of the 25 original entrants 20 started. The course was extremely rocky and hilly. It was 109 miles in length and embraced six controls, as follows: Antonio, De Soto, Antonio, Denny, Sappington and the clubhouse at the finish. The contestants were allotted 1,000 points at the start. From these deductions were made for any mechanical weaknesses that developed. At the end of the run they were examined by a technical committee.

FIFTEEN PERFECT SCORES IN DELAWARE RUN.

Wilmington, Del., June 27.—In the sealed bonnet run of the Delaware Automobile Association to-day, 15 of the 21 contestants finished with perfect scores as follows: Henry McComb Bang, Stoddard-Dayton; J. T. Chandler, Mitchell; William C. Corey, Mitchell; Eugene du Pont's Peerless; Eugene du Pont's Pierce; Eugene Du Pont's Thomas; Dr. John C. Fahey, Maxwell; Robert S. Clover, Maxwell; James F. Hoey, Buick; William E. Holland, Ford; J. R. Richardson, Mitchell; Albert Rothschild, Rainier; Joseph H. Shaw, Franklin, and Frank Yerger, Studebaker. The course was to Valley Forge and back, 79 miles.

TWO TOURS TO THE WILDWOOD RACE MEET.

Two tours are scheduled to start to-morrow for Wildwood, N. J., where a race meet will be run on the Fourth of July. One leaves from New York and the other from Philadelphia.

RECENT DEVELOPMENTS IN MAGNETO IGNITION*

By OTTO HEINS, Member Society of Automobile Engineers.

IN taking up the subject of magneto ignition, it is not my intention to attempt to cover the entire field of endeavor, nor even to try to outline the improvements made in every form of high or low-tension magneto on the market, within the past year or so. My experience has been confined to the Bosch apparatus, which needs no introduction, and it is my intention to show what has been accomplished in the study of automobile ignition devices as represented by the products of this firm.

The electrical advantages inherent in the ordinary low-tension system of ignition are largely offset by the mechanical complication of the mechanical interruptors, and ignition specialists have long sought to successfully combine the low-tension mag-

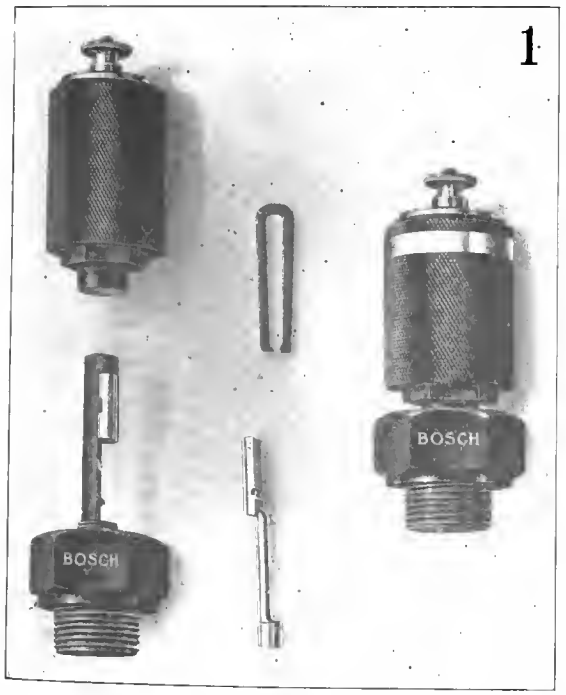


Fig. 1.—Assembly and Components of New Magnetic Plug.

neto-electric outfit. About three years ago the Bosch Magneto Company began experimenting with a magnetically-operated plug device on the Honold System, and last season placed it on the market.

The electro-magnetically operated spark plug is illustrated in Fig. 1. An important part of this plug is the interrupter lever, which rests on a steel knife edge, and one end of which bears on the contact piece, which is screwed into the cylinder wall in the same manner as a high-tension spark plug. At the bottom of the contact piece there is an insulated fixed stem which is magnetically divided in about the middle by means of a brass part, so that when the current passes through the coil, only the portion of the stem above the brass part can be magnetized, and, as a result of this magnetization the upper end of the interrupter lever, which directly faces the magnetized part, is attracted, the lower end simultaneously breaking contact with the contact piece, thus interrupting the current and producing a spark. In the normal position of the interrupter lever, the lower end presses against the contact piece, being kept in that position by a horseshoe-shaped spring, which passes right over the top of the stem and lies in slots in the sides thereof.

The top of the coil is fitted with a contact screw to which the current from the magneto is led. This magneto (Fig. 2) generates an ordinary low-tension current and is provided with a low-tension distributer distributing the current to the individual plugs, according to the number of cylinders, so that only one low-tension wire for each plug is employed. The distributer disc is shown separately in Fig. 3, as well as the interrupter, which latter is provided for the purpose of timing the ignition.

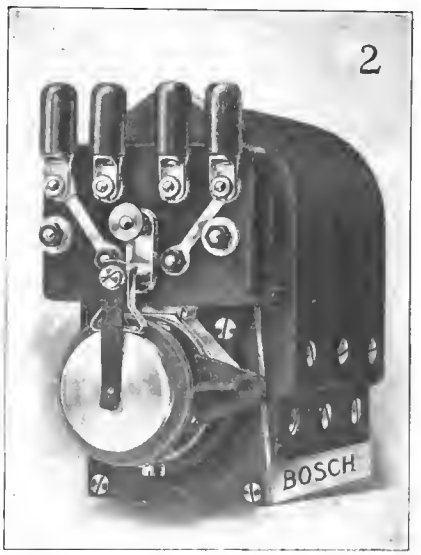

Fig. 2.—Low-tension Magneto with Synchronous Distributer.

Fig. 4 is a diagram of the electrical arrangements, which will be seen to be similar to those of the Bosch high-tension magneto. A portion of the wiring of the armature is short-circuited by the platinum points of the interrupter, and when the circuit is interrupted, the resulting armature reaction has the effect of raising the voltage of the armature sufficiently to operate the magnetic plugs. The rotating distributer bar is adjusted in such a way that it is always in connection with one of the spark plugs at the moment when the contact breaker of the magneto interrupts the circuit, so that the circuit to the plugs is closed and these are magnetized for operation.

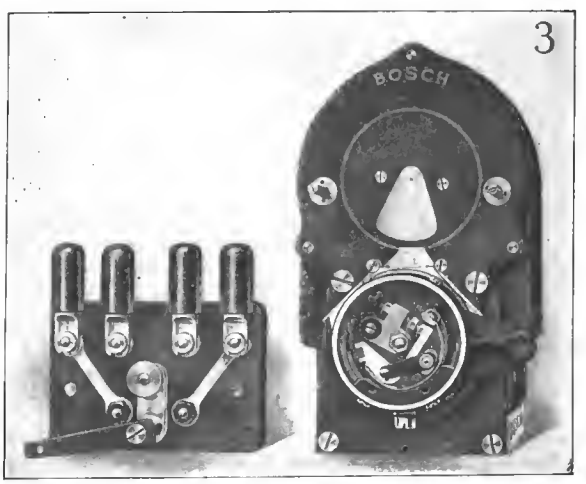

Fig. 3.--Details of Contact Breaker and Distributer of New Low-tension Magneto.

*Paper read before The Society of Automobile Engineers at Detroit, June 25-27, Third Annual Summer Meeting.

The spark is advanced or retarded by rotating the timing lever, in the same manner as with a high-tension magneto, and the timing range corresponds to an angle of 50 degrees on the armature shaft. The magneto is switched off in the same manner as a high-tension magneto, by making a ground connection. This is done by small plug switches with either a single plug or with a number of plugs equal to the number of cylinders, to enable each

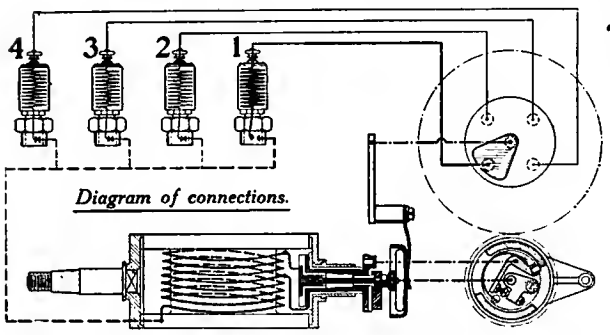

Fig. 4.—Wiring Diagram of New Low-tension System with Magnetic Plugs.

cylinder to be switched out separately for testing purposes, from the seat while the car is in motion. As compared with mechanically-operated igniters, electro-magnetic plugs are far simpler, and they are far more convenient, because they require no separate adjustment, as they are operated by the magneto itself.

Improved High-tension Systems.

During the past season dual systems of ignition have met with great favor among designers, especially among those who adhere to the high-tension principle. The author's firm has developed a synchronized dual ignition system, which comprises one of its various types of high-tension magnetos and combines the advantages of a *true* high-tension magneto and the coil dual system.

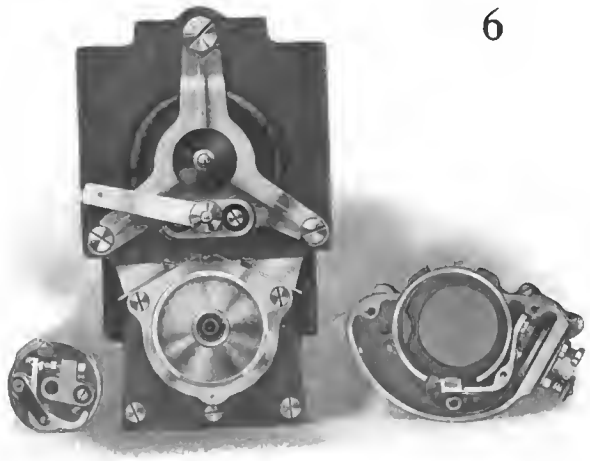

Fig. 6.—Showing Contact Breakers of Magneto for Dual Ignition.

The high-tension magneto, or the generator itself, differs from the standard rotary armature type in two respects only. In the first place, the high-tension connections are slightly altered, and, secondly, an additional contact-breaker for the battery is provided, as shown in Fig. 6, so that the magneto will serve also the function of a timer for the battery, while the one high-tension distributer of the magneto is used with both the magneto and the battery current. All other details of the magneto are similar to those of the ordinary machines, and it is therefore not necessary to describe them here.

For the battery ignition a special coil, as shown in Fig. 7, is provided, with a self-contained switch and a button for bringing a magnetic vibrator into circuit when desired. These various parts are all contained in a relatively small brass case, designed to be fitted to the dashboard, as illustrated in Fig. 8.

Contrary to usual practice in vibrator coil ignition, the vibrator in this new dual Bosch ignition system is only brought into operation for the purpose of starting the motor from the seat. As soon as the motor is working, the vibrator is cut out and the interruption of the current is effected by mechanical means. Consequently there is no lag in the operation of the circuit interrupter, as in the ordinary vibrator coil system, thus making a synchronized system. If there is any gas in the cylinder, the motor can be started from the driver's seat by simply pressing the button. The coil is of the general form of an *H* armature, as shown in Fig. 9, and not of the usual cylindrical form with concentric windings. It possesses the same amount of self-induction as the magneto armature, and while running the engine the two systems are absolutely synchronized, and no difference is apparent in the speed of the engine, whether the magneto or the battery is used.

Fig. 7.—Dash Coil and Self-contained Switch.

The trembler is only used at the moment of starting. The button switch for bringing it into circuit is fitted in the lid of the case in such a manner as to render it quite waterproof. In order to eliminate all long connections between the switch and the coil, the switch is directly combined with the brass housing of the coil, the short contact studs being well insulated from each other in the base of the housing. The connections are made by small segments in the bottom plate of the coil frame, the entire coil being moved towards the left or the right to effect the change-over. The switch handle projects through a circular slot in the housing and locks in three positions by a spring, the positions being designated respectively, as "Magneto," "Off," and "Battery." The combination is very compact and can easily be inspected by unscrewing the switch handle and removing the lid, when the coil can be taken out without disconnecting any wire, exposing the components of the switch.

The casing or housing being watertight and made of metal, prevents the coil being affected by atmospheric conditions. No wood is used in the construction. The connections between the dashboard and magneto, as shown in Fig. 10, are made by one quadruple cable, which contains the two high-tension wires and the two low-tension wires. Standard magnetos can be adapted to this dual system by only small alterations.

A New Small High-tension Magneto.

The great popularity of various light runabouts, and the growing use of the four-cylinder motor for such light vehicles, has of late created a demand for a small high-tension magneto outfit. Such a machine, suitable for four-cylinder motors up to 15 horsepower, is shown in Fig. 11. The chief *raison d'être* of this type of vehicle being its low cost of construction, its accessories

must necessarily be of low cost, and this point has been kept in view in the design of this magneto, though the electrical principles involved and the quality of workmanship are the same as found in the other high-tension magnetos of the Bosch Company.

This magneto is of the rotary armature type and must, therefore, be geared, for four-cylinder, four-cycle engines, to run at engine speed. The device is especially constructed with a view to enabling the layman to understand and use it, and the main parts can be removed without the use of tools. The parts of one of these magnetos are shown in Fig. 12. The interrupter is similar to the standard interrupter, but the distributer disc is of novel design and can be taken off with a jerk by pressing the springs on both sides. To simplify the ignition device, the magneto is generally furnished without any timing device. As these

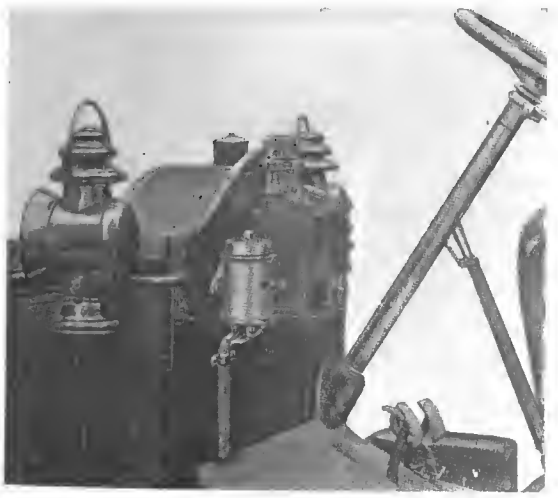

Fig. 8.—Relative Size of Coil Mounted on Dash.

magnetos will generally be used on small cars driven by persons with no special technical skill, the absence of a timing device has the advantage that the engine cannot be abused by incorrect timing. The magneto, however, can be readily supplied with a timing device.

Novel Coupling Device for Two-cycle Use.

On certain engines, particularly two-cycle and racing engines, an unusually large timing range is required. This necessitates the shifting of the magneto armature with respect to the driving

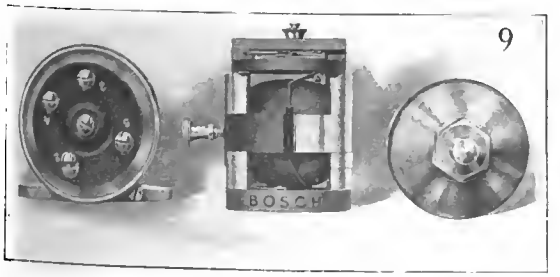

Fig. 9.—Components of Dash Coil and Switch Shown in Fig. 8.

shaft, which can be accomplished by a novel coupling device brought out by the author's firm. This coupling device, shown in Fig. 13, can be attached to practically any type of our magnetos. It consists principally of two rotary sleeves (as shown in Fig. 14), one fitting into the other, both provided with helical slots running in opposite directions, so that by removing the collar which carries pins which extend into the above-mentioned

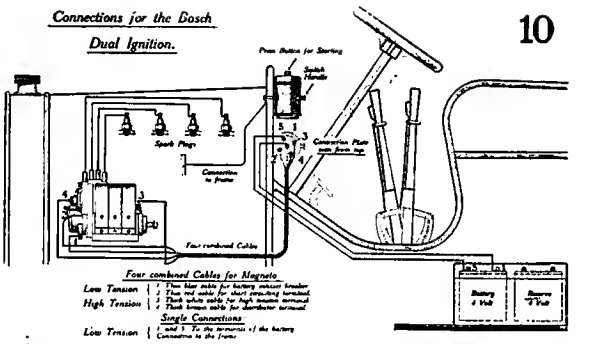

Fig. 10.—Wiring Diagram of Dual Ignition System Using Same Plugs.

slots, an angular movement of these sleeves relative to each other up to 60 degrees is obtainable.

In connection with the presentation of his paper on developments in magneto ignition that have been brought about during the past year or so, Mr. Heins, who has made a special study of the subject for a number of years past, and may well be considered an authority, also delivered an illustrated lecture outlining the development of ignition in the internal combustion motor since the latter first became a practical prime mover. The devices experimented with by Otto and Daimler and by many who followed in their footsteps were illustrated by means of lantern slides, and a complete review of this most important subject to the automobile engineer was gone through in a brief and interesting manner, the lecturer pointing out in a few words just where each inventor sought to improve upon the devices of his predecessors, and showing exactly how each one failed to realize in some important point or other the requirements of the problem to which so much study and attention has been devoted during the past quarter century. The subject is one of absorbing interest for every one connected with automobile engineering, and Mr. Heins' lecture brought out many points of interest.

Supplementary Paper Presented at Detroit.

After having dwelt upon the historical side of the question long enough to give an idea of what the present day ignition systems had been developed from, Mr. Heins went on to deliver a secondary paper of his own, which he had prepared on

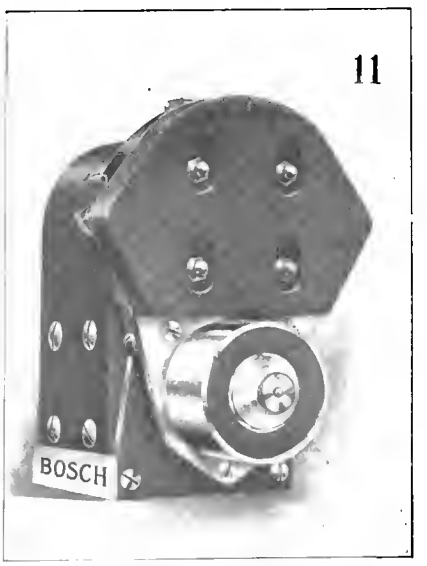

Fig. 11.—Small High-tension Magneto for Low-priced Cars.

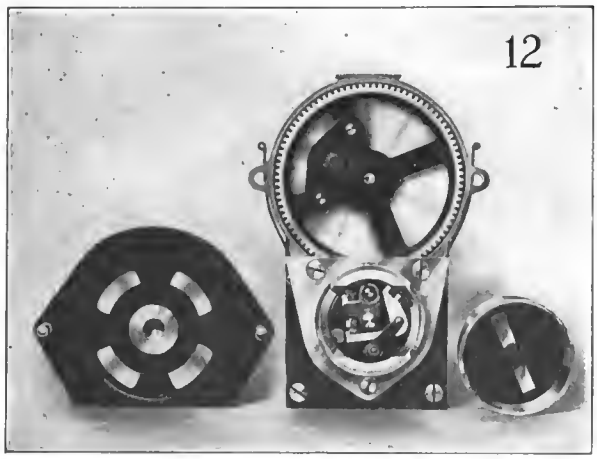

Fig. 12.—Distributer and Contact Breaker, New Small High-tension Magneto.

the subject since the submission of the illustrated paper which appeared in the Transactions of the Soeiety of Automobile Engineers, and which is being reproduced herewith. In this, he dwelt upon the purely technical side of the many problems that confront the automobile engineer in this extremely important essential of every gasoline car, and among the numerous lantern slides that were employed in connection with the lecture, many of them showed the electrical action of the magneto, giving its voltage and amperage under varying conditions as graphically illustrated by oscillographs. He also showed slides which had been reproduced by specially made photographs illustrating the difference between the spark produced by a coil system of ignition and by a high-tension magneto of the true type. The first of this series of photographs showed the appearance of the spark at 25 revolutions per minute, the photographic apparatus employed to take the pictures having been adjusted to run synchronously with the ignition apparatus, so that the results showed a true reproduction of the action of the two competing forms of ignition apparatus as compared with an accurate time factor. At the low rate of speed mentioned, the coil spark showed a solid line round part of the arc of a circle on the plate, but when increased to only a few hundred r.p.m., there was immediately apparent a very noticeable gap between each pair of the long series of sparks, and at high speed there was but a single spark, much reduced in intensity, and that occurred very late on the arc of the circle as compared with its original point, although the timing had not undergone any change. On the other hand, the magneto current recorded a substantial arc of light which was apparently not affected in the least by changes in the motor speed and which was unchanged in either timing of occurrence or power by the high rate of motor speed—as a matter of fact, there was a strengthening of the current owing to the much higher speed at which the magneto was being run, but this was not as plainly visible in the photographic reproduction as was the sudden falling off of the same element in the coil spark. Mr. Heins also compared the action of the true high-tension type of magneto with that of the magneto with coil high-tensicn type, in the same manner, showing the effect of the slight lag caused by the necessity of stepping up the current generated by the armature of the magneto to a high voltage in the independent coil. He explained the action of different forms of magnetos at some length and then went on to give a short review of the contents of the foregoing paper, descriptive of the improvements that have been made in the Bosch apparatus during the past year or more, and dwelling more particularly on what is without doubt the most radical advance made in this essential—that of the development of a satisfactory type of magnetic plug making it possible to employ a low-tension magneto without the necessity of the complicated igniter action that is now employed where the electric simplicity of this type is desired.

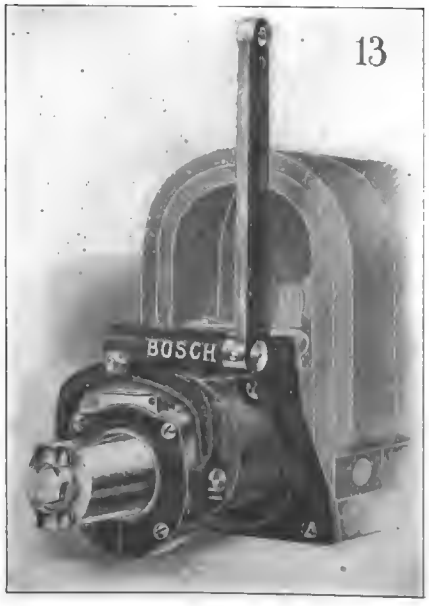

Fig. 13.—Coupling to Give Extreme Ignition Advance.

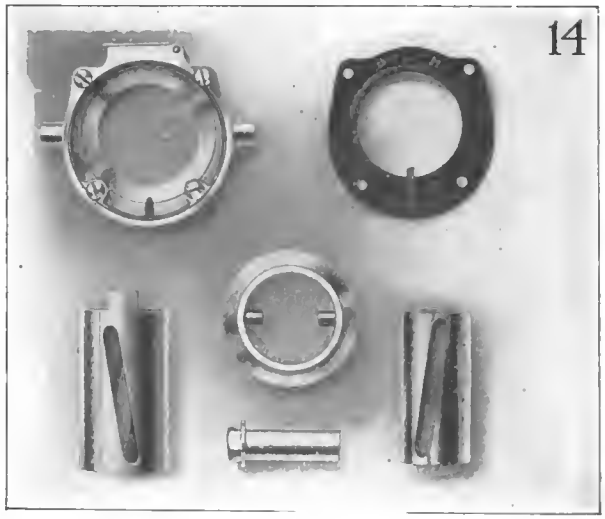

Fig. 14.—Components of New Bosch Coupling Device.

In referring to the new apparatus developed as the result of the past season's experience, special stress was laid upon the fact that, as far as it is possible to do so, both the magnetos and their accessories, such as the new coil switch for the dash, previously mentioned and illustrated, are so designed and constructed that they may be taken apart and readily reassembled without the use of any tools whatever, while their simplicity is such that they are not readily subject to reassembly with an improper relation of the parts when in the hands of even the most inexperienced autoist. The same tendency is noticeable in the case of the new high-tension magneto for small cars in that complication has been avoided by omitting the timing device.

NOTE.—Fig. 5 omitted.

LETTERS INTERESTING AND INSTRUCTIVE

BUYER LOOKS FOR HIS IDEAL CAR.

Editor THE AUTOMOBILE:

[1,446.]—I want to buy an automobile, when I can find one built somewhere near my notion. I am a subscriber to your valuable magazines and have watched the advertising columns, but have not yet found my car (all too heavy). The first safety bicycle I bought was in 1888; it weighed 114 pounds. To-day I have one that weighs only 34 pounds and is more flexible and stronger than the first mentioned.

I have had three automobiles and on account of their low power and heavy weight and unyielding construction they have ground out a small fortune in tires and repairs. Am now waiting for my ideal car. The following are suggestions for specifications: Six cylinders, 4 by 4 3-4 inches, engine and transmission on the principle of three-point support. Wheelbase, about 115 inches. Shaft drive with floating axle, springs semi-elliptic, front 2 1-2 inches wide and 50 inches long, rear side springs, 2 1-2 by 60 inches with cross spring at rear, all side springs nearly straight, with sufficient number of leaves under side to support load and one or two leaves on top to prevent excessive upward bounds. Wheels, artillery type, light construction for 36 by 3-inch quick detachable tires, body of light construction, side entrance, to seat four people. Bearings, Hess-Bright throughout; weight complete, not to exceed 2,000 pounds.

Will you kindly answer through your columns if there are any cars now made that will come quite near the above specifications. In my opinion, a car designed on above lines and kept within the 2,000 pounds would outsell any car on the market to-day.

Norwich, N. Y. C. W. L.

We do not know that there is any car on the market at the present moment that complies with your specifications in their entirety, and doubt very much if such a car is built, but there are some that approximate it in more respects than one. Every autoist of any experience has formulated a more or less clear idea of what he wants in the shape of a car, but as yet we do not know that any of these ideal cars have been built. If there are any of our readers who think they have cars that come sufficiently near to the requirements as above set forth, here is his chance to trot them out for inspection.

ANOTHER COMPARISON OF IGNITION SYSTEMS.

Editor THE AUTOMOBILE:

[1,447.]—Will you please answer through "The Automobile" the following questions? Would you advise purchasing a car equipped with make and break, using low tension magneto and jump spark plug battery ignition systems? Comparing make and break using low tension magneto, and jump spark using high tension magneto, what are the advantages and disadvantages of the different systems? C. A. LEWIS.

Chicago, O.

We would, where the advisee was inclined that way, just as we would advise an intending purchaser to invest in a car equipped with a high-tension system where he favored the latter. In the combined system you mention, the battery end is only used for starting, and practically all running is done on the magneto, although it is also possible to start on the latter by spinning the motor. To compare the two systems briefly, it may be said that the low-tension is simple electrically and complicated mechanically, while the high-tension system involves electrical complication with mechanical simplicity, but it would seem as if their differences were about to be merged by the adoption of a magnetically operated plug, using current from a low-tension magneto, this system having just been placed on the market. But even with the mechanism now required to operate it, we think the consensus of opinion is to the effect that the low-tension system is the more reliable. It is considerably more expensive to make than the average high-tension system, as the small parts of the ignitors and their operating mechanism must be made very accurately in order to give good service. The almost entire freedom of the low-tension system from electrical troubles is what causes it to appeal to many, while the lack of mechanical complication is a strong argument in favor of the high-tension system of ignition.

CONTROL BY SPARK OR THROTTLE?

Editor THE AUTOMOBILE:

[1,448.]—In our family are a '05 20-horsepower Stevens-Duryea and a '08 18-horsepower Stoddard-Dayton. The Stevens engine seems to speed up on the spark and the Stoddard on the throttle. On high the speed of the Stevens seems to depend on the spark and in the Stoddard the throttle. The timer on the Stevens seems to turn farther when advanced than that of the Stoddard. Does the carbureter make the difference, or what is it? If you would please answer I would be much obliged, as it is queer to run one with the spark high and the other with it low.

Waterbury, Conn. HOWARD P. HART.

You do not state whether either of the cars in question is equipped with a magneto or not, but from what you say, we presume not, and in this case the difference in running is to be accounted for by the factor of lag in the two ignition systems of the cars. According to popular impression, electrical action is absolutely instantaneous, or in other words, that the time intervening between the making of contact and the accomplishment of the desired result at the other end, is not a measurable period. This is far from being the case, for while electrical action is extremely rapid, magnetism requires an appreciable interval of time to manifest itself. The iron core of the primary winding of the coil must become magnetically saturated before it attracts the armature of the trembler, and both the inertia of the latter as well as the resistance of its spring must be overcome before the coil can act, so that there are no less than three factors that influence the time of occurrence of the spark in the cylinder. If the trembler spring is weak, there will be a further delay in rupturing the contact with a corresponding delay in the occurrence of the first high-tension impulse in the secondary winding.

If the spark is caused to occur exactly at the upper dead center, or a little before the piston reaches that point, then only the throttle will have any effect on the motor's speed, assuming, of course, that the ignition adjustment is allowed to remain as above stated. This is evident on several foreign makes of cars on which there is no provision whatever for advancing the ignition, the occurrence of the spark being retarded slightly for starting only. Such cars control on the throttle alone, and this would appear to be the case with your Stoddard-Dayton, a view that appears to be further supported by the fact that a greater range of timing is provided on the Stevens-Duryea. We think, however, that if you will always run the motor of the latter with the spark pretty well advanced, consistent with the work it is doing, you will find it possible to effect most of the control by means of the throttle, and you will then be getting a higher percentage of efficiency out of the motor, as the delayed spark wastes fuel and tends to heat the motor, owing to the slow burning. It will be evident that when ignition is taking place at the proper point, only an increase or decrease in the amount of fuel can have any effect on its speed and power. Advancing the spark only gives increased power of itself by permitting the motor to take better advantage of each charge of fuel. In other words, it is not adding to the power that can be obtained from a certain charge, but is producing a larger percentage of effective work from the same charge than where the spark is late.

WHAT IS THE SMALLEST ESSENTIAL PART?

Editor THE AUTOMOBILE:

[1,449.]—Will you kindly publish the name or description of the smallest essential individual part or piece of a car which goes to help make up the assembly of parts constituting the modern gasoline touring car ready for use. By essential I mean a part which, if removed from the car, would render it not usable.

Marshall, Minn. A. D. HARD, M.D.

This is a query the answer to which will depend upon the car itself. Assuming a single-cylinder car using high tension ignition, probably the platinum contact piece from the end of the trembler

screw is the smallest piece, the loss of which would render running difficult. It measures not much more than 1-16-inch in any dimension. It might be possible to run without it, but not satisfactorily, or for any length of time. The loss of the screw itself, which measures 1-2 or 3-4-inch across its circular top and is about 3-4-inch long by 1-8-inch diameter, would prevent running altogether. The loss of the locking nut from the needle valve of the carbureter might prevent any use of some cars, owing to the needle point turning very loosely. This is somewhat akin to the platinum contact point, as the car could be used, but the loss of the needle itself would prevent this and probably it is next on the list, although on some low-priced cars on which pinned joints are employed the loss of the pin from such a place as the connection of the propeller shaft to the universal would render the car useless until it was replaced. On a car using a high-tension magneto alone for ignition, the loss of the small carbon brush collecting the current from the primary winding of the armature would prevent the starting of the motor. This part is doubtless next in size to the platinum screw above mentioned. We are not certain that any of the foregoing comply exactly with the requirements of your definition of essential, individual parts, and they do not, if you mean by this a part complete in itself. In such a case, the loss of a spark plug from a single-cylinder motor would probably answer your query as well as anything. A little study of the question thus raised seems to lead to an endless number of possibilities and attention to the latter on the part of amateur autoists would reveal things about their cars the very existence of which they have never even suspected and would be the cause of their becoming very much more familiar with the machines they have been driving.

PREVENT OIL REACHING THE CLUTCH.

Editor THE AUTOMOBILE:

[1,450.]—Will you please give me some information in your department "Letters Instructive and Interesting"? I have a 16-horsepower touring car, planetary gear, leather cone clutch for direct driving, located in flywheel. Flywheel is not solid, but is spoked. I have replaced the leathers in the clutch once before, but not on account of the clutch slipping. Just replaced them when car was taken down because it was good time to do so. The leathers in the clutch are not old, but clutch will not hold. Slips all the time. I put in stronger springs, but this did not help. I think it is on account of oil from crankcase coming out through main bearing on flywheel side and getting in clutch through spokes of flywheel. Have tried everything. Carbids dust from gas generator, street dust, Fullers-earth, and Fullers-earth mixed with glycerine, all to no avail. Clutch will begin slipping again in less than two miles running after fixing it. If you can help me out same will be appreciated. R. S. TRULOCK.

El Reno, Okla.

No friction clutch can be made to hold where it is exposed to lubricating oil in any quantity and nothing that can be put on the facing will prevent the lubricating oil from causing it to slip. To remedy such trouble it would be advisable to attend to the end bearing of the crankshaft in order to prevent as much oil as possible from coming through there, as was doubtless the case when you got the car originally, and also to fill the spaces between the spokes of the flywheel with thin sheet metal or a similar oil-guard, unless the flywheel is meant to act as a fan, in which case it will be necessary to rely upon keeping the main bearing oil-tight.

CAUSE OF A KNOCK IN ONE CYLINDER.

Editor THE AUTOMOBILE:

[1,451.]—Kindly advise me through your "Letters Interesting and Instructive" what the trouble is with a two-cylinder opposed engine which runs smoothly on the high, but knocks in the front cylinder when the clutch is thrown out and gas and spark are retarded. Is this due to a loose part, and if so, where is it most likely to be found? Battery good, coil in adjustment, and no other trouble apparent. READER.

Milwaukee, Wis.

If caused by a loose part, this will most likely be found in the connecting rod or piston pin bearings, but from your statement of the case it does not appear to be trouble of that nature, as considerable looseness in these bearings will go unnoticed as long as the motor is run without load. If it were such a knock it would be most apparent when the clutch is in and the motor is driving the car, particularly on a grade. There may be something wrong with the adjustment of the ignition timing, by means of which the forward cylinder is caused to fire much sooner than the other, so that when the spark is retarded considerable back pressure is set up, which would account for it.

FRICTION-DRIVEN CARS IN HILLY COUNTRY.

Editor THE AUTOMOBILE:

[1,452.]—What has been the experience with friction drives for rough and hilly roads, such as are common in New Hampshire? I am told by almost everyone that they will slip, and are only good for fine roads. JAMES P. MELZER.

Milford, N. H.

This is something that we will have to refer to our readers for a definite answer, not having had any experience in the use of such a car in hilly country. It is well-known, however, that the friction transmission is an excellent type where the load is at all uniform or steady and that its chief drawback is not so much its inability to take care of an overload as it is to transmit an excessive load, suddenly applied, as in pulling the car out of a mudhole, or in starting from dead on a very steep grade. We understand, however, that manufacturers of cars employing this type of transmission have developed it to a point where it is unusually successful in situations for which it was formerly considered as practically valueless. Every car is equipped with a frictional element in some part of its transmission, namely, the clutch, so that it is not the use of friction for driving, but the manner in which it is applied, that constitutes the drawback. Doubtless some of our readers will come forward with further information gained from personal experience.

WILL SOME READER OBLIGE ON THIS?

Editor THE AUTOMOBILE.

[1,453.]—I would like to ask if any of your readers have tried the Holley 1908 "puddis" carbureter on the two-cylinder Autocar runabout and with what results? G. P. WELLS.

Fulton, N. Y.

We presume the inquirer refers to the Venturi tube type of carbureter made by this firm, in which there is always a small pool of gasoline present, no needle valve being employed, so that this carbureter functions for starting as a surface type and then brings the Venturi tube into action, so that we have taken the liberty of quoting puddle in the foregoing letter. Doubtless some information on this point would be appreciated by other readers as well.

AUTO PAPERS PUBLISHED ABROAD.

Editor THE AUTOMOBILE:

[1,454.]—Kindly tell me the names of some French and English automobile papers; also what language they are printed in, and if they are illustrated, in "Letters Interesting and Instructive."

McHenry, Md. H. T. CHITTENDEN.

The *Autocar, Automotor Journal, Motor* and *The Car* are among the leading English automobile papers; all are printed in English and are profusely illustrated. Any of them may be reached by addressing them at London. *Omnia* and *La Vie Automobile* are the leading French papers, are printed in that language and are well illustrated. *L'Auto* is a daily published in the usual daily newspaper form. All are issued in Paris.

CHEWING GUM AS A RADIATOR REPAIR.

Editor THE AUTOMOBILE:

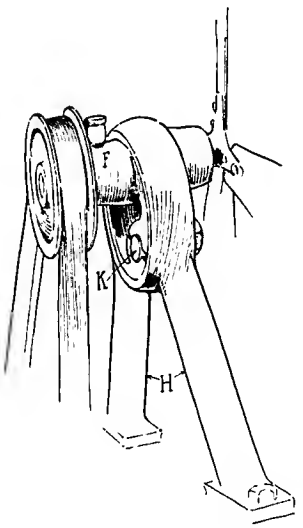
[1,455.]—Referring to your "Letters Interesting and Instructive" about repairing radiator leaks, I agree with you that there is no practical way to make a permanent repair except having it soldered by a competent repair man. I have, however, made temporary repairs which have run nearly a whole season without leaking, by the use of ordinary chewing gum (the pepsin or tutti-frutti kind); pressing it over the leak like putty.

This has the advantage of stopping small leaks for a time without filling up the circulating system like bran or flour.

Lebanon, N. H. CHAS. S. DAVIS.

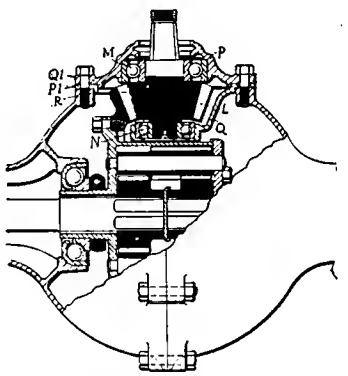
AMONG THE AUTO FACTORIES OF INDIANAPOLIS

INDIANAPOLIS, IND., June 29.—There are seven factories in Indianapolis directly interested in making motor cars, and a host of others which manufacture essential parts and accessories. Of these factories one has been running a night force since last October and through the thick of the money flurries; while the resourceful executive of another concern, having found a small plant insufficient for its ever-growing needs, has resorted to the use of tents to help out the cramped floors, with the result that members of the firm are not infrequently rallied to reveal the day's output of available factory space. Nearly all of the remaining plants are busier than their capacity normally warrants, so that the explanation of the "smiles that won't come off" is not far to seek.



Fan Adjustment of Premier.

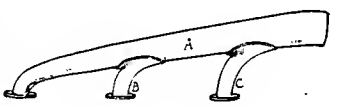
Almost every conceivable school of motor car practice is represented. The new Premier may be justly described as the machine of standard practice par excellence. The firm's latest motor is as neat, as refined and as representative of the best in engine construction as any motor in the world. There are many things about this particular engine which are very interesting, and of them, before entering into details, mention must be made of the employment of low-tension ignition. The use of a low-tension ignition system by a new firm, or a firm whose production had hitherto been very limited, would not be so remarkable, but its adoption by a concern which previously had sworn by a high-tension system is a change in essential practice deservedly claiming attention. The origin of the change of ignition system was the adoption of a six-cylinder model.



Premier Rear Axle Support.

The Premier experience with high-tension systems in conjunction with the six-cylinder motor, particularly at high speeds, led them to search for a practice which, while of especial simplicity, would nevertheless be independent of engine speed for its efficiency. The present make-and-break system is the result and is a fine example of the scientific mechanic's art. In general principle it is an ordinary make-and-break operated by horizontal cams, the plugs being located in a valve cap of either cylinder. So far it resembles the practice of two well-known foreign cars—the Itala and the Weigel—but its essential difference lies in the action series of the hammer motions. In the two cars mentioned a circular cam has a depression formed in its profile against which the hammer-operating lever is caused to bear by means of a tension spring, the spring being connected to the fellow operating lever of the adjacent plug, which bears on an entirely similar cam. The action in this case is as follows: The cams, having a circular formation, merely sustain the hammer lever against the action of the spring until such time as the depression is reached. Then the hammer lever drops until contact is made within the cylinder, directly after which, the end of the depression being reached, the contact is broken and ignition occurs, the circular portion of the cam resuming its function of holding the hammer arm out of contact.

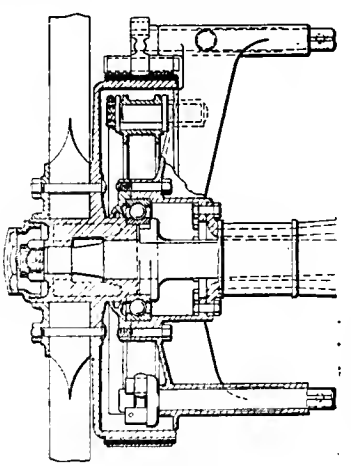
In the Premier system the general arrangement is identical with the difference that the spring is utilized to break the circuit after the cam has caused contact to take place. In order to render the making of the circuit sure and to provide for slight inaccuracies of setting, and also to compensate for possible wear, the Premier has developed a very pretty "automatic take-up," which is illustrated. As will be readily seen, the hammer lever is made up of two pieces, the one in rigid connection with the hammer proper and the other pivoted about a sleeve formed by extending the boss of the above-mentioned lever. Inspection of the illustration shows these levers at *A* and *B* respectively. Lever *A* has an open jaw formed at its free end which corresponds to a block section formed in lever *B*. The jaw on *A* is slightly wider than the corresponding portion of *B*, so that the lever *B* can move relative to the lever *A*. The small spring *S* causes the lever *B* to lie snugly against one side of the jaw on *B*. When the cam *C* revolves it is obvious that it will move the combination lever made up of the levers *A* and *B* until contact is made within the cylinder, after which any further movement is taken up by the clearance between the lever *B* and the jaw on *A*. It is easy to see that by setting the plug initially so this clearance is absorbed, or nearly so, that wear to the amount of the clearance must take place within the cylinder before resetting is called for.



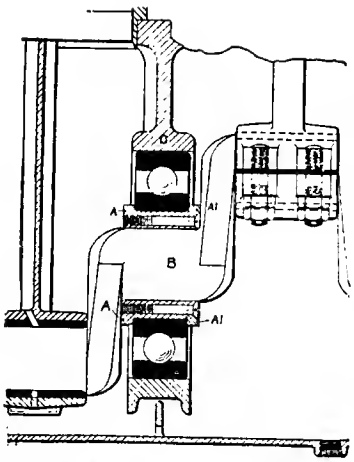
Water Pipe of Premier.

Care in Ignition Workmanship.

The system is especially ingenious and equally effective; not that the effectiveness shown by it in practice is due so much to the design of the plug but for the reason that many of the manufacturers of low-tension ignition systems forget—perfect workmanship. At the Premier plant a small department has been created to manufacture these low-tension plugs, and it is equipped to turn out only the highest quality of work. Finishing of opposed working parts is accomplished by means of crocus powder lapping, and the most rigid inspection is maintained. The particularly impressive



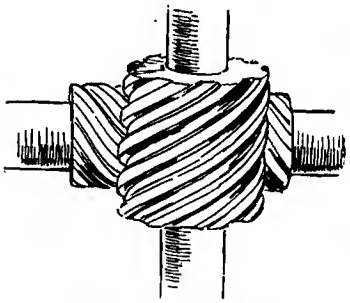
Premier Brake Construction.



Ball Bearing on National Crankshaft.

point is that the hammer and anvil points of the plug are actually liberally tipped with iridio-platinum inserts. One had begun to forget such things in these commercially hard manufacturing times.

The Premier factory management certainly understands the relation of a dollar to a dollar's worth. It does not spend any unnecessary money at that plant, but what it does spend has had such a foundation laid in the way of jigs and tools that it is not difficult to maintain a high production rate. It would be impossible to enumerate the thousand and one kinks found there, but one or two examples may be interesting. For instance: The Premier people use a cast gun iron crankcase. Another point which is interesting from a manufacturing standpoint is the way in which the water pipes are made up. Most people know that a sheet metal double or triple taper water pipe for the head of an engine is not the cheapest or easiest thing in the world to make. The taper part is easy enough, and the bend at the small end. but the remaining inlets are difficult and costly if made by the coppersmith. The Premier factory makes the taper tube *A* and the single bend and uses castings *B* and *C* for the remaining cylinder leads. Another kink is the way in which the lower half of the crankcase is made up. A gun iron frame *D* is covered with sheet steel *E* riveted into place. The composite job is as light as an aluminum casting and has certain obvious advantages of its own.



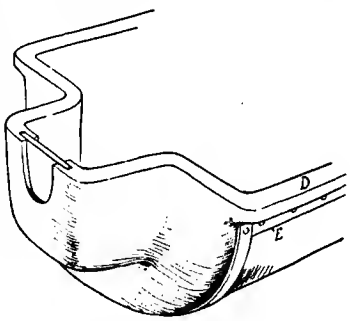
Premier Spark Advance.

System Above All.

The importance of perfection of the handling system is a point which hardly appeals to the average business man, but there are comparatively few people who realize—even though they be salesmen directly connected with the motor car industry—the extraordinary number of parts there are in the modern multi-cylinder machine. If, however, they do realize that the details are numbered in the thousand, they will begin to appreciate the thoroughness with which the organization must be carried out in order to avoid overhead and dead changes eating into the legitimate profits. In the Premier factory the systems are particularly effective, and although not especially novel are exceptionally well operated. The stock room—a general source of indefinite information at the end of the financial year in only too many plants—is most thoroughly safeguarded from unrecorded inroads. This digression must be looked upon as the natural sequel to a description of a few of the neatly economical kinks which have already been considered in this connection.

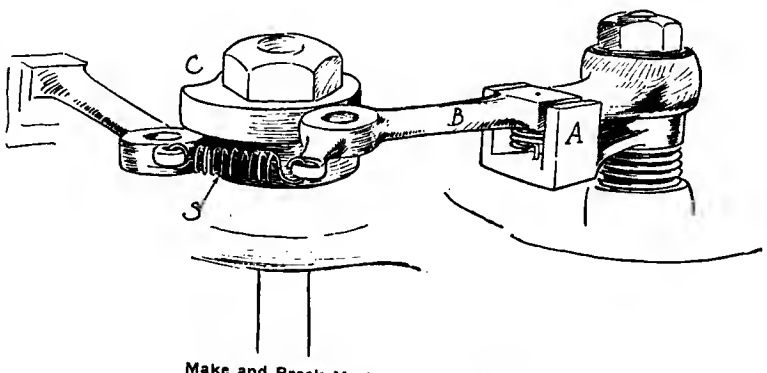
To return to technicalities, the fan adjustment of the Premier is soundly designed and comes as a distinct relief from the various twisted hoop iron crudities which are only too frequent. It consists, as a glance at the illustration will show, of an eccentrically formed sleeve carrying the fan spindle *F* and its bearings mounted in a bracket *H* bolted to the forward end of the crankcase. The fan pulley is for a V belt and is remarkable in this respect; but the neatest thing about the construction is the means adopted to retain the adjustment of the belt tension. The eccentric about the bearing sleeve is split with a saw cut, this dividing a taper hole. A taper pin *K* is located in this hole and can be drawn down by a nut. The act of tightening the nut causes the eccentric to expand within the bracket carrying it and so lock itself frictionally in position.

Probably the Premier rear axle contains the greatest novelty in the car. This is a semi-floating type, on Hess-Bright ball bearings, and in respect of being semi-floating alone is remarkable, but apart from this point there are some details as clever as they are novel. One of the best of these is the way in which the bevel driving pinion *L* is supported by ball bearings at the base *M* and the apex *N*. The saucer-like castings *P* and *O* are used; dished diversely, each having a circular flange. These circular flanges register together and are in contact when assembled; within the space between the two lies the driving pinion *L* supported fore and aft by Hess-Bright ball bearings *M* and *N*. The coincident flanges *P*1 and *Q*1 also register with a similar flange *R* formed by the axle castings so the assembled pinion housing bolts right into place and completes the axle housing assembly. The inner saucer-like casting *Q* is cut away for about a quarter of its circumference through the dished wall, this opening permitting the meshing of the housed pinion with the driven bevel gear. It is just a feature of this axle design that everything on it is circular, but it is one of those features that permit one manufacturer to turn out a high-class job at a reasonable price, while another gets out badly with a less efficient though more complex system of handling.

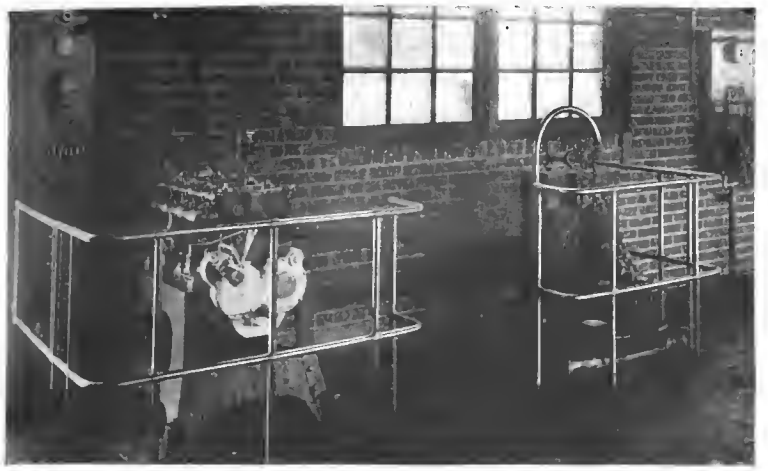


Premier Crankcase Construction.

In one or two factories they have the design and production so schemed that rapid and accurate work is not only possible but difficult to avoid doing. In others, notwithstanding elaborate jigging, much money is sunk unnecessarily where the designer might have accomplished much by a variation of a decimal of an inch in a facing, a bore, a flange, etc. And it is noticeable.



Make and Break Mechanism of the Premier.



National Motor Used for the Generation of Electricity.

too, that simplicity, rigidity, cheapness in the shop and efficiency invariably go together, as they are all but the results of a modern system of manufacturing automobiles or other machinery.

A Thorough Testing Scheme.

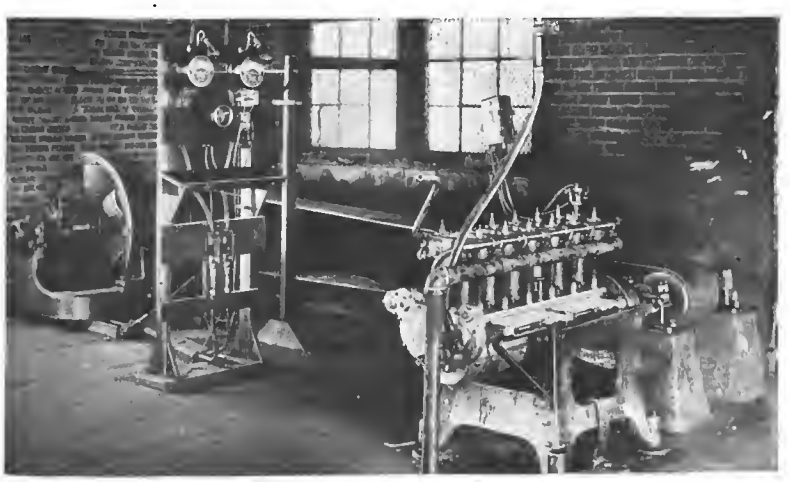
To go back to the Premier factory, however, and the things done there, there can be no better indication of the policy of the firm than the thoroughness of the testing. There is none of the slap, dash, that's good enough system that is found once in a while even among manufacturers selling high-priced cars. Each and every engine, four or six, is run first as a dummy, then light, and lastly has to stand a steady pull at overload for a fixed time. What is more, the system is lived up to thoroughly—there is no question of bye-and-bye. The engines have to pass the full test before they get to the assembling floor—rush or no rush. Then the chassis come out and get to the road testers, who set a strenuous pace. Not that this phase is peculiar to the Premier testers—the National, the American, the Marmon and the Overland all do the same, and inasmuch as there is very healthy rivalry among the testers of the various Indianapolis factories, there is no doubt that the road testing is thorough, though the speed laws outside the city limits may be annihilated at times.

National Car All Made in Home Plant.

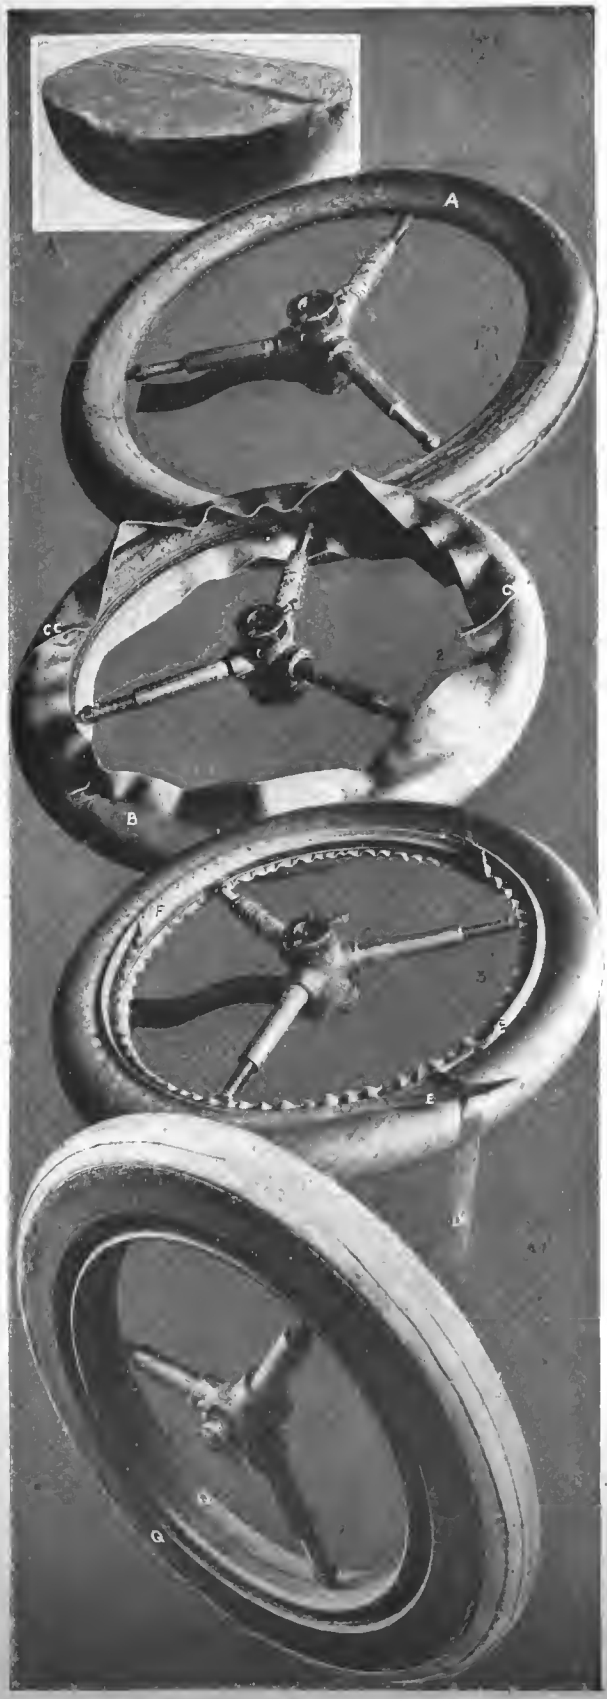
So much for the Premier line of automobiles. At the other side of the city lies the main plant of the National company, which by the way, possesses two, one—that already mentioned—where the chassis work and assembling is done, and the other, where the engines are built and tested. The former is quite a large place, fully and busily occupied. With the manufacturing end of the product well along, interest is centered upon the assembling floors, and here exceptional activity can be noticed. They build three models in the National plant, build them from stem to stern, and it is not hard to realize that with these moving through the plant the organization work has to be made more comprehensive than where only one or two models with entirely duplicate parts are the standard product.

As no doubt many of THE AUTOMOBILE's readers know, the National company has many especial points of interest in its 1908 engine, among which not the least must rank the use of Hess-Bright ball bearings on the crankshaft. The use of radial ball bearings on a crankshaft is a practice which, having been developed abroad, is used by but few people on this side of the Atlantic. The reasons for this are twofold: Firstly, the construction is necessarily expensive, and, secondly, apart from the expense of the ball bearings, there are some engineers who do not approve the practice. Opinion in this direction appears to be very evenly divided, and there is no doubt that where ball bearings are used freedom from lubrication trouble and extraordinary accelerative properties are attained. Moreover, in the case of a six-cylinder engine it permits of a shortening of the over-all dimensions, and, apart from any mechanical advantages derived, this shortening of the engine, even though it be a matter of a few inches, is quite important, as it permits a reduction of wheelbase—the bugbear of the six-cylinder machine. The National company uses what is known as the "threading system" and secures the bearing of the shaft by means of split sleeves. The bearings employed have a bore sufficiently large that they can be passed along the shaft, the collets being removed to render the necessary diameter of bearing as small as possible. In order to secure the bearings to the crankshaft a split foundation collar *A* and *A*1 is used, which when assembled corresponds to the bore of the inner race of the bearing. This collar is located positively with the crankshaft *B* and it is impossible when the bearing is in place for any derangement to occur. The bearings being assembled on the shaft, it is necessary to make sure that the shafts are quite straight after the handling, and in the National engine plant the straightening is done with the help of a very ingenious device. They are then ready for placing in the crankcase and it is very noticeable in National practice that the ball bearings are located directly in the aluminum *C* of the crankcase without the use of intermediate hard metal cages.

There are a number of other ingenious devices for labor-saving purposes which indicate how closely the National executive keeps after its factory costs. Prominent among these is a row of valve-grinding machines which will handle the most refractory valve-seating job in about one-twentieth the time it can be done by an expert mechanic by hand. However, as usual with factories making their own engines, the engine testing room is the pride of the National plant.



Testing One of the National Six-cylinder Motors.



THE MAKING OF G & J TIRES.

The manufacture of a pneumatic tire is undoubtedly one of the least known operations and processes in connection with the motor car. The public is familiar with the making of castings as well as the finishing by grinding and machining, but is decidedly unfamiliar with the manufacture of a pneumatic tire. Due to the kindness of the G & J Tire Company, Indianapolis, Ind., THE AUTOMOBILE this week is able to show eight stages in the process of manufacturing tire casing, each of these being illustrated by reproduction of photographs specially taken in the G & J factory.

The rubber used in the manufacture of any standard motor car tire is composed largely of the Brazilian product, principal among which are those varieties known as para rubber. The three most popular grades of this rubber are fine, medium and coarse, and are obtained principally from the territory covered by the Amazon and its tributaries. The rubber mostly used at this plant is fine para, which in itself has many classifications, but has in all its various grades a very uniform quality. It is usually shipped in the form as shown in illustration A, which is known to the trade as a rubber "biscuit." On arrival at the factory these biscuits are placed in large vats of hot water in order that they may become slightly softened before the washing process is begun. They are then placed in the washing machines, which are built of spirally corrugated rolls, and are passed through these many times with jets of water playing on the rubber the whole time, thus removing any foreign substances that may have been picked up with the rubber, and at the same time sheeting out the rubber into long thin sheets which, when thoroughly washed, present a spongy, porous appearance. These sheets are worked down to a thickness of about 1-16 of an inch, so that the greatest possible surface of same may be exposed to the air.

Illustration B shows these sheets in the process of drying. The rubber is taken from the washers to the dry-room and is allowed to remain there until every element of moisture is absorbed therefrom. Usually this process will take from six to seven weeks, and care has to be exercised to prevent the rubber from becoming overdried, and oxidizing. Before the rubber is compounded, an expert goes through the dry-room and carefully selects from his rubber the kind and grade that is most particularly adapted for the special requirement that he may have for same.

The rubber is then taken to the compound department, where certain inorganic substances are added to it, so that the necessary gravities and vulcanizing ingredients may be provided for. From this department it is turned over to the mill room, and in the process of milling all these various ingredients are evenly distributed, and the whole is kneaded into a soft plastic state, which enables the calender man and tire builders to handle same. By a process of calendering, the friction gum is evenly distributed on a specially woven fabric, made from selected sea island cotton of long staple and great tensile strength. The meshes of this fabric are filled during this process with the gum composed entirely of fine para—and a series of small rubber rivets are thus formed which unite the various layers of fabric together during vulcanization into one compact and homogeneous mass. Great care is exercised during this process to prevent the fabric from becoming strained either in the warp or filler, the idea being to retain to its fullest extent the tensile strength of the fabric.

The fabric thus treated is in rolls varying from 110 to 120 yards in length, which, after being calendered, is taken to the cutting room, where, according to the sizes of tires required, it is cut into strips of varying widths.

Now comes the manufacture of a tire. The rubber is by this time ready for the tiremaker, who has at hand a cast-iron core A, Fig. 1, on what is technically known as a buck and spider, being a swinging arm which permits of readily moving the cast-iron core A in each direction. Before starting the manufacture of a tire, the core A is thoroughly cleansed and dried, after which it is covered with the first coating of a rubber solution.

The tiremaker having prepared a strip of fabric B, Fig. 2, made of closely woven sea island cotton and impregnated with pure gum rubber, cuts a series of strips from this on the bias and stretches them tightly over the core A, the illustration showing the diagonal joining in the strips B at point CC. It would appear that trouble would be incurred in having the fabric lie closely and smoothly around the core A, but owing to the bias cutting the workman is able to roll it down without difficulty until perfect conformation with the core is secured.

Having covered each diagonal joint of the fabric strip B with a film of pure rubber, he applies a second layer of fabric identical with the first and then after lining the inner edge of the embryo tire with a pure rubber strip D, Fig. 3, he proceeds to insert the clinch or bead E. This is made from many strips of fabric varying in width previously built, rolled accurately to shape, and semi-cured—that is, partially vulcanized. The clinch is immersed first in rubber solution and is then fitted as shown with a diagonal overlapping joint. When in place, the second fabric layer is turned up over the clinch as seen at F and then with a roller knife the workman trims it to half the depth of the bead as at G.

According to the size of the tire to be made, varying numbers of layers of fabric are used. That applied after the insertion of the clinch is cut so that when finished the overlap at the bead matches the reverse overlap we have seen at G, Fig. 3. The completing layers of fabric are carried right to the inner edges of the tire beads. The fabric foundation being complete, the cushion stock, as the tiremakers call the first rubber layer, is put on. The neck of the section is first covered with the narrow pure gum strip H, Fig. 4, and then the wide rubber sheet I is laid and rolled into place. The rubber used to this stage of the construction is as pure as possible.

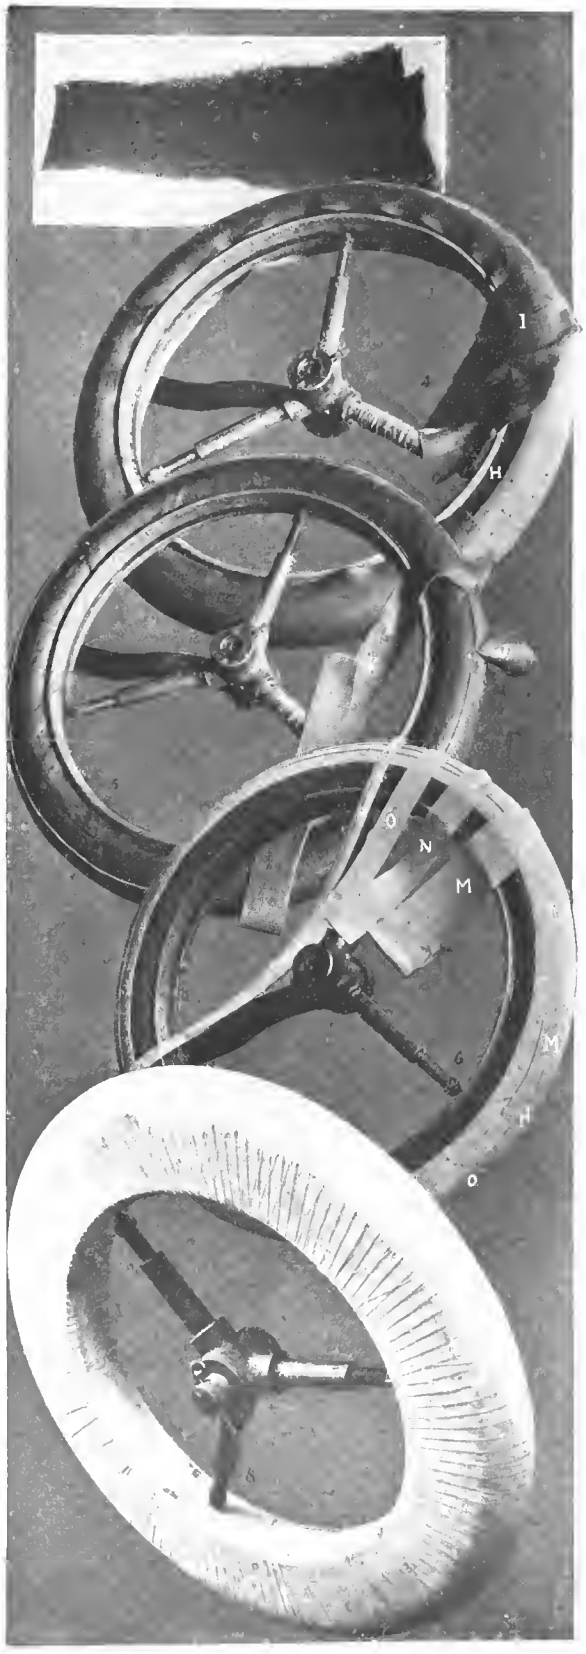
Having laid the "cushion" stock, the "breaker" strips, J and K, Fig. 5, are applied. These consist of rubber-impregnated fabric of coarser weave that the material used in the foundation, but cut so that the direction of the warp of the material is along the tread of the tire instead of diagonal to it as with the fabric used in the building of the carcass. Strip J, Fig. 5, is finer in weave than strip K, but each aids the other in providing strength for the tire in the direction of its future motion. Functionally, the breaker strips are used to reduce the strain on the tire body. The joints in both breaker strips being duly covered with pure rubber film, the laying of the tread is commenced.

The tread consists of compounded rubber—that is, the pure gum mixed with sulphur and other inorganic materials destined to increase its resiliency and durability—and is built up of strips of varying widths. The tire of the picture uses five to its tread composition, seen variously at L, Fig. 6, completely laid, and in order of decreasing width at M, N, O and P, respectively. Each strip is rolled separately into place and then copiously pricked to permit the escape of any air possibly remaining between the layers during the subsequent curing process.

The tiremakers' task is now nearly complete. The last function of the builder is to clamp on the heavy cast-iron flanges QQ, Fig. 7, and draw them together with bolts. The object of these flanges is to insure the accurate shaping of the bead and to obviate any possibility of distortion or wrinkling of the fabric during the vulcanizing process.

The last step in the constructional operations before ingenious labor makes way for the magic of the chemist is the wrapping of the tread, Fig. 8. This is done by machinery and a wetted cotton bandage R is used, being wrapped radially about the tire form. The drying of the already tightly stretched bandage in the curing chambers causes great pressure to be evenly exerted on the tread of the tire, thus materially aiding in the consolidation of the rubber composing the tire. The vulcanizing or curing process carried on at a high temperature causes each rubber layer to so closely identify itself with that with which it is in contact that it is afterward impossible to trace the lines of coalition.

Owing also to the rubber flowing during the vulcanizing process, the finished product, fabric rubber clinch and tread are homogeneously and inseparably welded together in a permanent bond.



RHODE ISLAND'S NEW LAW PRETTY NEAR "THE LIMIT"

PROVIDENCE, June 30.—With the avowed object of securing the protection of the motorists in Rhode Island by securing the enactment of just laws governing the use of the highways by all vehicles, and to prevent, by legal means, discrimination against users of motor vehicles and their unjust prosecution, a second association of automobilists has been formally effected in this city. The officers of the new league are George H. Huddy, Jr., president; J. S. Gettler, secretary, and George C. Arnold, treasurer. Mr. Huddy is the assistant United States district attorney.

The organization of the league was the outcome of the new law passed a few weeks ago in this State, in which the owners of automobiles were taxed according to the horsepower, and the entire matter of licensing the machines was taken from the Secretary of State and placed in the hands of the State Board of Public Roads.

It is about as unpopular a bit of legislation with the drivers and owners in this State as has been passed in New England.

The law was framed by members of the General Assembly, largely composed of members from the rural districts, and in spite of strenuous objections from owners of cars in this and other cities features were incorporated which it is believed are unconstitutional.

Heretofore certificates of registration and numbers for the machines were issued by the Secretary of State upon the payment of a nominal fee, but it was argued by the members of the General Assembly, a majority of whom are from towns in which there are few resident owners of automobiles, that the fast-driving of the cars was the cause of destroying the macadam roads. They urged that the larger and more powerful the car the greater was the damage, and incorporated in the law not only a speed limit of 15 miles an hour, but also provided that each car should be taxed in proportion to its horsepower.

The entire matter was placed under the jurisdiction of the State Board of Public roads, with instructions to the owners of automobiles to take out new licenses and secure new numbers. This many of the owners have thus far neglected to do, and the State Board of Public Roads has already sought the assistance of the police in the several cities and towns to aid them in enforcing the law.

At a special meeting of the Rhode Island Automobile Club for the purpose of discussing the new law, Colonel Frank W. Tillinghast, a prominent attorney and himself an enthusiastic automobilist, expressed the opinion that the registration fee as provided for in the new law should be paid by the owners of the cars under protest. He urged the members of the club to accompany the registration fee with a written protest, so that the money would be returned in case the test case which is now before the court, should result in upholding the contention of the owners that the law is unconstitutional.

It was the unanimous opinion of those present that if the authorities were to insist upon the wholesale "honking" of horns at every cross street it would become such a great nuisance that the public would rise up and protest. These horn regulations have been branded as unreasonable and obnoxious, and it was the general opinion of those present at the meeting that the drivers of the machines should run their cars so that there would be no necessity for constant "honking" and clanging of bells.

The test case to try the constitutionality of the new law was begun when a deputy sheriff served the members of the State Board of Public Roads with writs in the case of Jefferson K. Crafford, who has filed a petition with the Supreme Court for a writ of mandamus, ordering the board to furnish him with a certificate of registration for his automobile.

The case is backed by the Rhode Island Automobile Club and arose through the refusal of Mr. Crafford to pay the registration fee of $15 to register his automobile. The test case will be watched with interest, as it questions the constitutionality of the new law in many features, particularly on the ground that it imposes double taxation.

RECENT CHANGES IN MASSACHUSETTS AUTO LAW

BOSTON, July 1.—Automobilists or motor cyclists who contemplate touring in Massachusetts on or after the 12th of this month should take into account the new law which was passed by the legislature recently adjourned, and which goes into effect on that date. While the act makes no very radical changes in the motor vehicle laws, it does make certain changes of which tourists should be aware. Two new punishable offenses are specified, and the power of the highway commission is much strengthened in the matter of suspending and revoking licenses. The act was originally drafted by the Safe Roads Automobile Association. After being heard by the committee, certain changes were made at the suggestion of the highway commission, and the bill was much mulled over in the committees, being passed only during the last day or two of the session.

To autoists from outside the State, who are just now coming into Massachusetts in large numbers, a section of the new law is particularly important. The non-resident who has complied with the laws of his home State may still drive in Massachusetts seven days without taking out a Massachusetts registration. He must, however, drive himself, as the law does not make provision for the operation of such a car by a chauffeur. But if a non-resident driving in Massachusetts during the seven days' limit is convicted of violating any provision of the automobile laws, whether or not he appeals, he must thereupon have his car registered here and secure a license, thus placing his car and himself under the jurisdiction of the Massachusetts highway commission. The courts are required to send records of the convictions of non-residents to the highway commission.

The new law enlarges the powers of the highway commission in several directions, most important perhaps being the provisions which constitute the commission an investigating body in relation to accidents. It is specifically provided that the commission may summons witnesses, administer oaths and take testimony, thus making it to all intents and purposes a court. Whenever the death of any person results from such an accident the commission is required forthwith to suspend the license of the operator, and must revoke the license, unless, upon investigation or after a hearing, it determines that the accident occurred without serious fault upon the part of the operator. If a license is revoked it cannot be renewed for at least six months.

Another change in the law of interest to automobilists made by the legislature which has just adjourned is the putting on the statute books of the law of the road. This law reads: "Whenever on any bridge or way, public or private, there is not an unobstructed view of the road for at least 100 yards, the driver of every vehicle shall keep his vehicle on the right of the middle of the traveled part of the bridge or way, whenever it is safe and practicable so to do." The penalty is a fine of $20 and liability in an action commenced within twelve months of the violation. The legislature also passed a law for the codification by the highway commission of the automobile laws, the commission to report the 1st of next January.

Recent Progress in Highway Improvement in Pacific Coast States

by James W. Abbott.

Part III

One of the Beautiful Boulevards of the City of Los Angeles, Cal., That Has Been Treated by the Petrolithic Process.

IN the first of these articles I showed how Washington and Oregon are solving the problem of ways and means. In the second I showed how California is solving it. In this I will try to indicate something of the progress which California has made in methods, and how California, in my judgment, is going to give the world new lessons in road construction, so that when that international congress which has been called by the government of France shall meet, and the United States is asked for its report, California may arise and say, "Eureka!" And so all the rest of the nations may concede that California *has found it.*

The first innovation, to which I shall refer but briefly, relates to the paving of city streets where the traffic is the heaviest, and where hitherto no construction has been devised which shall be adapted as well to the needs of the heavy dray as to those of my lady's automobile or the children's pony cart.

A gentleman of Los Angeles has invented a process by which he hopes to take a soft, common brick, the cheapest kind we now use in building houses anywhere, and convert that brick into a hard, tough, durable unit which, when laid in a pavement, shall make a homogeneous street covering which will not crack, will not crumble, will not rot, but which at the same time will furnish a sure footing for horses, be resilient beneath their feet, and will be the ideal pavement for an automobile.

It seems incredible, I know; but months ago there was laid upon the busiest streets of Los Angeles, where the teaming is heaviest, ten feet of a sample pavement constructed with brick of this character, and, so far as I could judge, the brick has made good. That brick is not on the market. Its inventor has refused to give me particulars, saying, "We are not ready. There is much for us yet to learn. We are satisfied we are on the right track. While I should be delighted to have you the first to tell the world of this wonderful invention, I can only give to you such facts as any man may gain without any assistance from me."

The rest of this article will have to do with a method of road building which, in my judgment, will, when absolutely and finally perfected, meet every requirement for street or road service, from that of a street of heaviest traffic to a country road.

The limitation of this process will be climate. Where the line will be drawn, no one can yet say. The process involves the mixture of a mineral oil, carrying a high percentage of asphalt, with the natural soil of the road surface, and the tamping of this intimate mixture by an apparatus known as a tamping roller which has projecting prongs, each one of which, as the roller is drawn over the road surface, in its turn enters the loose soil and tamps it down, as the feet of sheep tamp the ground whenever a flock of sheep passes over it. The surface of this road will be made in cases of the natural soil of the region. In other instances, it will be a layer of extraneous material.

Slauson Avenue, Southern Boundary of Los Angeles.

Road made by petrolithic process on natural sandy soil, suggests the solution of the Florida problem, where similar conditions exist.

The origin of this method was in Kern county in this State. I learned of it in 1902, when I was preparing my paper afterwards published by the United States Department of Agriculture under the title "The Use of Mineral Oil in Road Improvement." I did not get a chance to see one of the rollers, and of course I did not witness its operation; and hesitating to write of what I had not seen, I did not mention it in my paper.

The eminent civil engineer, H. P. Gillette, whose works on several engineering subjects have become classic reference books for the profession, himself an enthusiastic road expert and road authority, saw the importance of this before I recognized it; and he induced his father, T. W. Gillette, to look into it. T. W. Gillette was my old co-worker in the Northwest. Years ago, when chairman of the Board of County Commissioners of Whatcom County, Washington, he led the movement for highway betterment in that county which resulted in making Whatcom county, Washington, at one time the most famous county for its roads in the United States.

It required courage in those days to use the people's money to construct roads through the bog holes and swamps of that section, where the roads had been so soft that they would mire a saddle blanket, and where it had been supposed that nothing but a plank road would float upon the waves of mud. But Mr. Gillette is a man of great tenacity of purpose as well as foresight. He was quicker than his associates to see what Whatcom county must have, and almost at the risk of his life he forced them to join him in that enlightened policy, which later made Whatcom county so illustrious.

Mr. Gillette, then and now president of the Fairhaven Water Company, spending part of his time in Whatcom county, Washington, and the rest at his beautiful home in Pasadena, induced to join him a number of gentlemen of wealth

Orange Grove Avenue, One of Los Angeles' Beauty Streets.

Street in Monrovia, Cal., Improved by Petrolithic Process.

and large view who were satisfied to accept the judgment of himself and his eminent son. They organized what they called the Petrolithic Pavement Company, the name being derived from two words meaning petroleum and rock.

With unfailing patience and unswerving purpose, they have worked at this problem. There was a vast deal to learn. Little was known definitely about mineral oil. While some oils were valuable, other oils were nearly worthless. Little was known about how substitutes for natural asphalt oil could be obtained. Little was known about the effect of oil in road-making, outside of California. Up to date, these men, engaged upon a work of universal beneficence, have found the balance large on the wrong side of the ledger. It will not always be so. If my study of road building in every possible phase for nearly forty years has been sufficient to justify me in forming a reliable conclusion, this petrolithic pavement road, when finally perfected, is to be the most satisfactory roadway for mankind.

That epigram of the ancient Romans, "Ad astra per aspera," receives a new confirmation in the experience of every great, successful enterprise. This is the lesson these gentlemen have been learning from contractors of differing grades of honesty and intelligence, the puzzling vagaries of nature in producing oil, the physical laws of road material, and the varying climates of widely separated localities. There is much yet to be learned. There is much known to-day which was not known a year ago. There is much yet to be done before the inertia of ignorance and habit among men has been finally overcome.

In California the battle has been practically won. That Pasadena boulevard which a year ago was an abysmal morass, is to-day, as I have said, the best road I have ever seen; and it is the best because it is a petrolithic road. The most interesting feature of it perhaps is that it did not cost more than a quarter of what a stone covered road would cost.

In a bend of that road, where the flying squadron of automobiles from Los Angeles meets the flying squadron coming from Pasadena, and where each is obscured from the sight of the other by an intervening slope, there was recently a sign which bore the legend, "Please slow down here to seventy miles an hour." A few days ago I went out with my camera to preserve that realistic feature of the landscape, but I found myself too late. It was gone, and I was awfully disappointed. It is true that automobiles do fly over this road at seventy miles an hour, but it is fair to assume that they generally get down to at least thirty when rounding this curve. In the interest of a common humanity, let us hope so.

The autoists tell me that nowhere else in their experience have they ever ridden over a road so satisfactory to them or their patrons. Neither warts nor smallpox have developed upon the surface of this road, but the automobile glides along with a motion suggestive of the Twentieth Century Limited, as smoothly almost as if on a velvet carpet.

Three years ago the town of Monrovia, a few miles east of Los Angeles, began constructing a system of petrolithic streets upon the natural soil which is a disintegrated granite. Those streets are to-day one of the features of interest to the tourist in Southern California. They have had no repairs during the time and they exhibit no signs of wear.

Los Angeles is bordered on the south by Slauson avenue. The natural soil is sand, and on a portion of Slauson avenue has been constructed a petrolithic road. It is ideal, and no road

A Typical Bit of Pasadena, Cal.—In the Foreground Are the Homes of Two Directors of the Petrolithic Movement.

builder could see it without exclaiming, "Here is the solution of the Florida problem." Any road builder who knows the character of the sand which overlies most of Florida and who understands the action of asphalt with sand and carbonate of lime, which is more or less abundant in Florida, knows that the sand of Florida would yield better results under the petrolithic process than Slauson avenue has yielded.

West Adams street, in Los Angeles, the most magnificent residence street in that magnificent city, has recently been paved by the petrolithic process, the specifications having been gotten up by Homer Hamlin, the city engineer of that city, and one of the most competent city engineers in the United States. If there is a Barber asphalt pavement in the country which will touch West Adams street in as many of the essentials of a perfect pavement, it has never yet been my privilege to see it, nor have I ever yet seen a Barber asphalt pavement constructed at a cost of 35 cents per square yard, which I am told is more than it cost to pave West Adams street.

Pasadena is *facile princeps* the most beautiful residence city in the world. Here the art of man has taken the handiwork of God and out of it fashioned the most exquisite collection of æsthetic products ever grouped within the boundaries of a single city. What West Adams street is to Los Angeles is Orange Grove avenue to Pasadena, sixty feet wide between

A Tamping Roller Showing the Feet of the Iron Sheep.

curbs, on either side for miles in unbroken succession bower after bower of bewildering beauty.

Before the automobile came, with its wearing effect upon road surfaces, Orange Grove avenue was paved with granite, after the old Macadam method. Its preeminent function has always been to feed and clothe the watering-cart man and his family. At certain hours each day the automobiles which sweep along that avenue have distributed impartially upon the just and the unjust a shower of mud. During all the other hours of each pleasant day this street material in varying degrees of desiccation is whirled up in clouds, which the wind, blowing where it listeth, generally lists to drive into the faces of all the people who pass up and down the avenue.

The emancipation of Orange Grove avenue awaits the petrolithic process. It will be a hard blow to the watering-cart man, but I think there will be much compensation in the absolute freedom thereafter from the showers of mud and the whirlwinds of sand which have hitherto been such a destructive plague upon fine raiment and the countenances of human beings.

If the Los Angeles County Highway Commission does not make a comprehensive use of the petrolithic process in the roads they are going to construct, I shall be very sorry for them after they have experienced the effect of public sentiment.

The Petrolithic Pavement Company has thus far made no attempt to do anything in the East. When they get ready to invade New Jersey there will be something doing, as your readers who ride in motor cars will discover. Although their operations have been confined largely to California cities, of which nearly forty have already had the benefit of this process, so insistent has been the demand from outside points that almost in spite of themselves the breastworks have been advanced to Louisiana, Florida, Cuba and even to Rio de Janeiro, Brazil, and I do not hesitate to predict that in the not distant future he who attempts to follow the petrolithic flag will find that, like the flag of Great Britain, it will lead him around the world.

I beg to say in this connection that I have not a cent's worth of interest in the petrolithic pavement, and never expect to have; that my interest in the cause of good roads solely has led me to take this interest in what I conceive to be the most important event in road construction since the days of Macadam; and I beg to say that it has been only at considerable financial loss that I have done it. Like all my other experience in road work, it has been at serious personal sacrifice.

This may be the last article I shall ever write on the road subject. It is my present determination that that shall be the case. But I am very glad that it has been permitted to me to make my final message, as I believe, so important to mankind

ROAD EXPERIMENTATION IN MASSACHUSETTS.

Boston, July 1.—To the Commonwealth of Massachusetts with its more than 700 miles of improved State highway and its nearly 14,000 registered automobiles, to say nothing of thousands of visiting machines constantly using the roads, the problem of maintenance and preservation has assumed a serious aspect and the Highway Commission is casting about for some effective means of preventing the rapid deterioration of the fine stone highways which stretch from one end of the State to the other.

The problem of road maintenance in Massachusetts is complicated by the numerous and varied conditions that are encountered, ranging all the way from the steep grades of the Berkshires to the sand of Cape Cod.

The most interesting experiment that has yet been undertaken is that which is just about to be started by the commission and the town of Hamilton. This is the construction of a dustless highway, the contracts for which have already been let. It is proposed to tear up a strip of much traveled road and to build it over from the bottom course to the top. The bottom course will be laid as in the ordinary macadam road of stone crushed to the proper size. This will be rolled hard. There will then be applied a course two inches thick of stone which has previously been treated with tar. This will be spread on and rolled solid. Upon the top will be placed a thin layer of tar. The top layer is considered the most important of all, for it is not desired to build a tar concrete but rather a stone road with sufficient tar to bind it and give a smooth surface.

Another interesting piece of work is about to be started on Cape Cod between Chatham and New Orleans, where there is no stone to speak of and where the road must be built entirely from sand. Here a Texas asphalt oil is to be used. The sand road will first be shaped with a road machine. Over the surface the oil will be spread hot. After the first coat has been on two weeks the second coat will be applied. Then the surface will be cut up with a disc harrow so as to mix the sand and oil to a depth of four inches. Then the road will be rolled and thin sprinkling of sand put on to take up the surface oil. The commission did a little work of this kind two years ago and it proved so satisfactory that it has been adopted for use on the Cape, where there is not material for stone roads. On the piece originally built in this way the results have been excellent, a good, firm road resulting, which has stood up under the wear better than was anticipated.

A third new method that is being tried is the application of thin coal tar. In the town of Marlboro two contracts have been let to parties making proprietary coal tar preparations. One applies the tar cold and the other applies it hot. The stone road is first swept, then the thin tar is applied and brushed in, after which the sweepings are put back to form a surface.

THE AUTOMOBILE

REMOVAL NOTICE.

The Class Journal Company, publishers of "The Automobile," "The Automobile Blue Book," "The Automobile Trade Directory," etc., has removed its publication offices to the Thirty-ninth street building, Nos. 231-241 West Thirty-ninth street, New York City, from the Flatiron building, where the offices have been located for the past five years.

The rapid increase in the company's general business has made it necessary to enlarge its facilities, and the entire sixth floor of the new building is devoted to its present requirements.

A cordial invitation to our patrons is extended to visit our new offices, where every courtesy will be extended.

New York patrons are requested to make special note of the new telephone number, 2046-Bryant. It is not listed correctly in the New York telephone directory.

THE CLASS JOURNAL COMPANY,
231-241 West Thirty-ninth street,
New York.

AUTO ENGINEERS A GROWING BODY.

Nothing has served to show more strikingly the widespread interest in the movement for the fostering of independent engineering investigation in the automobile field than the success which attended the holding of the third annual summer meeting of the Society of Automobile Engineers at Detroit during the latter half of last week. Although this infant engineering organization can already claim an age of three years, which though little in other fields of endeavor, is a considerable lapse of time when measured by the rapidity of progress in the automobile field, it has suffered during the greater part of its existence from having had its light hidden under a bushel. The fact that there was such an organization in the industry only needed to be known to attract to its support the majority of the leading engineers and designers, and immediately the fact was made known that the Society also welcomed to its ranks the technical men of the accessory and allied interests the increase in its membership has been very rapid.

The possibilities for good that are bound up in such an organization, both to the industry as a whole and to the individual engineers themselves, need hardly be dwelt upon. As evidence of what can be done by proper methods and a wise administration, the dean of engineering bodies in this country, the American Society of Mechanical Engineers, need only be cited. Although it has required many years for the latter organization to arrive at its present position of influence and authority in the mechanical field, the future that lies before the Society of Automobile Engineers is not less bright and its development is bound to be many times as rapid, not alone owing to the great rapidity with which things progress in the automobile industry, but also owing to the fact that conditions generally are vastly different.

With a view to insuring the greatest attendance with the least inconvenience and of procuring all possible facilities right at hand for the furtherance of its investigations, it is the policy of the Society to hold its meetings in automobile manufacturing centers, barring the annual meeting, which, under its constitution, must be held in New York, and there is every prospect that the third quarterly meeting for 1908, to be held in Cleveland, will be fully as successful as its predecessor.

* * *

STUDYING THE TRANSMISSION PROBLEM.

For the present, at least, it may be conceded that the matter of motor design and construction has been brought to a fairly well established point of standard practice. True, there are numerous standards, but barring revolutionary discoveries, improvement will follow the lines of detailed refinement rather than radical departures from types now current. This being the case, the problem of working out the most efficient method of transmitting the power from the motor to the rear wheels appears to be the most important item of design that now confronts the automobile engineer. Naturally, many consider that this has already been solved, and to a certain extent this is the case. The tendency in recent years has been toward the adoption of what has been aptly termed the "transmission axle" on one hand, while on the other the motor and gear-set are one.

A moment's consideration suffices to show that both types embody numerous advantages and that in many instances those of one are lacking in the other. Herein lies the difficulty, for it is a matter of common knowledge that it has thus far been found practically impossible to reconcile designers on such points as the dimensions of main bearings, even where their standards differed from the other fellows' by sixteenths, or sometimes even sixty-fourths of an inch. The transmission axle permits of the use of a single universal and a long driving shaft, but it brings considerable unsprung weight on the rear tires, and the advantages of the motor and transmission unit type are likewise counteracted by disadvantages, so that the problem calls for much study.

NATIONAL COMMITTEE OF THE AMERICAN AUTOMOBILE ASSOCIATION

IN CHARGE OF THE

GOOD ROADS AND LEGISLATIVE CONVENTION

TO BE HELD AT BUFFALO, NEW YORK

JULY 7-8, 1908

CO-OPERATING NATIONAL ORGANIZATIONS: NATIONAL GRANGE AND AMERICAN ROAD MAKERS ASSOCIATION

Hon. Charles Thaddeus Terry, New York.
Charman, Legislative Board, American Automobile Association.

Frank B. Hower, Buffalo.
Chairman, Touring Board, American Automobile Association. President Automobile Club of Buffalo.

Robert P. Hooper, Philadelphia.
Chairman, Good Roads Board, American Automobile Association.

Hon. James H. MacDonald, Hartford.
President American Road Makers Association.

Ex-Governor N. J. Bachelder, Concord, N. H.
Master of National Grange.

W. H. Hotchkiss, Buffalo.
President American Automobile Association.

Alfred Reeves, New York.
Representing the American Motor Car Manufacturers Association.

S. D. Waldon, Detroit.
Representing the National Association of Automobile Manufacturers.

F. H. Elliott, New York.
Secretary, American Automobile Association.

"GOOD ROADS AND UNIFORM LEGISLATION"—THE CRY

EVERYTHING points to a momentous gathering of automobilists and highway improvement apostles at Buffalo July 6, 7 and 8, on the occasion of the American Automobile Association's Good Roads and Legislative Convention. Not only clubs, but State divisions are organizing tours. Each day brings advices of additional delegates appointed by Governors of States, highway boards and clubs.

"Good Roads and Uniform Legislation" is to be the slogan. The battle cry quoted will be seen in red and white lettering on thousands of blue pennants made for the occasion, with the emblem of the American Automobile Association in the center.

The committee is now finding it difficult to keep the program down to proportions practicable for the time allotted, as the list of speakers and demonstrators has been steadily increasing.

Additional delegates from Western States appointed by the State executives are: By Governor John C. Cutler, of Utah, Hon. D. R. Roberts; by Governor Henry A. Buchtel, of Colorado, Dr. F. L. Bartlett, E. A. Coleburn, G. H. Fernald, George E. Hannan, J. Harvey Nichols, Jr., A. T. Wilson, W. S. Hunnewell, E. L. Mathewson and D. M. Howell.

In addition to the delegates from sixteen other States, various clubs have so far notified the committee that they will be represented as follows:

Automobile Club of Hartford, Conn., Walter S. Schutz.

Automobile Club of Southern California, Los Angeles, Charlee B. Hopper.

New Jersey Automobile and Motor Club, Newark, Paul E. Heller, J. H. Wood, chairman good roads committee, and F. A. Crosselmire.

Automobile Club of Springfield, Springfield, Mass., Mark Aitken. A. E. Lerche, M. T. White and S. L. Haynes.

Elyria Automobile Club, Elyria, Ohio, A. L. Stark, W. N. Gatee and A. L. Garford.

Automobile Club of St. Louis, Mo., Roy F. Britton and Sam D. Capen.

Automobile Club of Wilkensburg, Wilkensburg, Pa., Dr. W. R. Stephens, A. J. Puffinburg and Dr. W. C. Cook.

Automobile Club of Philadelphia, Powell Evans, W. O. Griffith and S. Boyer Davis.

Quaker City Motor Club, Philadelphia, A. T. James, Edwin A. Lewis, Dr. W. J. Donnally and L. E. French.

Chicago Automobile Club, T. J. Hyman, Claude Seymour and A. R. Stumer.

Automobile Club of Bridgeport, Bridgeport, Conn., S. T. Davis, Jr., and A. L. Riker.

Wilkes-Barre Automobile Club, Wilkes-Barre, Pa., Dr. E. C. Wagner and W. L. Raeder.

Malden Automobile Club, Malden, Mass., A. E. Bliss, A. B. Tenney and C. P. Price.

Automobile Club of Washington, Washington, D. C., Robert B. Caverly, John K. Heyl and William D. West.

Norristown Automobile Club, Norristown, Pa., Edwin S. Nyce, Fred M. Jacquith and John E. Mountain.

Automobile Club of Pittsburg, Edward Kneeland, John C. Bragdon, Paul C. Wolff, Edward J. Kent, M. F. Leslie and S. A. Stewart.

Automobile Club of Germantown, Germantown, Pa., Mark Reeves, Charles H. Thompson and C. H. Wheeler.

Cleveland Automobile Club, W. C. Baker, H. L. Vail and W. P. Murray.

Automobile Club of Franklin, Franklin, Pa., John A. Wilcon, Charles Gearing and C. E. Trace.

Automobile Club of Vermont, Springfield, Vt., Charlee C. Warren, James M. Boutwell, W. D. Woolson and W. W. Brown.

Brockton Automobile Club, Brockton, Mass., Henry R. Burbeck.

Rocheeter Automobile Club, H. C. Strong, W. C. Barry, Jr., F. E. Mason, John W. Breyfogle, W. H. Campbell and Bert Van Tuyle.

Long Island Automobile Club, Frank G. Webb, Alfred Wilmarth and Russell A. Field.

Automobile Club of Kansas City, Kansas City, Mo., George M. Hawes and L. R. Moore, Jr.

Mt. Vernon Automobile Club, Mt. Vernon, N. Y., William Adams, Franklin A. Merriam and Mark D. Stiles.

Cities, towns and villages will be officially represented by appointed delegations, and the good roads flag will fly from every automobile, every hotel and hundreds of buildings in the Bison City, while the streets will swarm with men wearing the emblem of the A. A. A. convention.

It can safely be prophesied that the convention will mark the beginning of a historic epoch in the fight for uniform legislation and the battle for improved highways in this country.

HARD STRUGGLES AHEAD FOR A. A. A. TOUR TROPHIES.

ONE week from to-day the fifth annual reliability run of the Automobile Association will start from Buffalo. Indications point to a list of participants very close to that of last year, despite the doubling of the entry fee and that the contest for the Glidden and Hower trophies will be fought more fiercely than ever before. This is especially true of the Glidden contest, in view of the fact that the club teams this year will be almost universally made up of trios of individual makers, thus adding more destructive trade rivalry to the struggle.

Entries will close to-morrow with Chairman Frank B. Hower, at Buffalo. In past years the bulk of the nominations came with the closing day's mails. Mr. Hower says that from the assurances of entries he has had from makers, many of which have not yet materialized, he is confident that history will repeat itself this year. The entries given out by the touring board chairman up to the close of last week are nearly up to the number received at the corresponding date last year.

Recent nominations for the Glidden trophy embrace J. F. Duryea, Stevens-Duryea; I. H. Page, Stevens-Duryea; C. H. Foster, unnamed; Frank H. Nutt, Haynes, and Loring Wagoner, Haynes.

The following officials will assist Chairman Hower in the conduct of the tour: Dai H. Lewis, secretary of the A. A. A. Touring Board, in charge of the confetti and pilot car; E. L. Ferguson, starter; Mortimer Reeves, checker at the finish, and in charge of night controls; F. D. Stidham, chief of observers; H. D. Herr, hotel arrangements; David E. Hoag, M.D., official surgeon; Arthur Jervis, press representative; W. L. Conklin and W. A. Carroll, watchers.

Charles J. Glidden, the donor of the trophy bearing his name, will, as usual, be on the tour. Mr. Glidden will be the guest of Mr. Hower, and will ride in his car, starting every morning half an hour before the first contestant and setting an even pace. No contesting car will be allowed to pass the chairman's car.

MANAGER MILES IS HOMEWARD BOUND.

S. A. Miles, general manager of the N. A. A. M., is expected to return from his European tour between the 8th and 10th, in time to attend the preliminary meeting on the allotment of spaces for the Chicago Show, which will be held at the headquarters of the National Association, New York City.

NEW YORK TRADESMEN TO PROMOTE RACES.

It is reported that some New York tradesmen are to form an organization for the promotion of races on various tracks in the metropolitan district. It is believed that the Briarcliff committee, made up of the entrants in the last contest, will be the nucleus of the new race-promoting body.

HOTCHKISS APPOINTS COMMITTEE ON FOREIGN AFFAIRS

THE most important development of the week in the A. A. A. racing situation is the announcement that President Hotchkiss bas appointed a special committee, the members of which are now in Europe, and practically all of whom will witness the Grand Prix race at Dieppe, France, on July 7. The aim of this committee will be to clearly define the position of the American Automobile Association through a properly accredited delegate, who will appear before the International Association of Recognized Automobile Clubs at the coming Ostend meeting.

The following official statement from A. A. A. headquarters, which is appended, is self-explanatory, and fully covers the phases of the question involved:

To the end that governing bodies abroad may be accurately informed as to American conditions and concerning the standing of the American Automobile Association as the national governing body both in racing and as the central organization for the dissemination of touring information, tbe procurement of proper motor legislation and the promotion of the present movement for good roads, President Hotchkiss of the American Automobile Association has appointed a special Committee on Foreign Affairs, composed of William K. Vanderbilt, Jr., Jefferson DeMont Thompson, A. G. Batcheider, S. A. Miles and Robert Graves. All of these gentlemen will be in Europe this summer and most of them will attend the Grand Prix race at Dieppe on July 7. Indeed, it may be possible that after conference in Paris this committee will be represented at Ostend and then officially bring before what is known as the International Association of Recognized Automobile Clubs the exact facts as to our American conditions. Recent advices from Europe clearly indicate that the leading motorists abroad are not acquainted with these facts and thus have been easily misled by interested agents on the ground.

The committee above named has been given large powers, and, it is believed, will make it clear abroad that there is and can be but one national body in the United States; that no single club can be such national body; and that the national body is tbe American Automobile Association with its twenty-four State associations, ite 200 clubs, and its regietered membership of 20,000.

June 30, 1908. FREDERICK H. ELLIOTT, Secretary,
American Automobile Association.

CHICAGO WON'T BE TAIL TO THE NEW YORK KITE

THE Automobile Club of America's little scheme for a chain of allied clubs to help make good its bluff as a national organization and thus give some color to its pretenses to the the control of racing in this country, bas received something of a setback in the Western metropolis. The Chicago Automobile Club did not fancy a little bit being made a mere loop in the tail of the New York Club's kite and said so most pointedly in the following resolution, which was unanimously adopted by its board of governors:

"Resolved, That the Chicago Automobile Club respectfully declines the invitation of the Automobile Club of America to withdraw from the Illinois State Automobile Association and thereby from the American Automobile Association, and to join with the Automobile Club of America in an effort to control American motor racing."

Winthrop E. Scarritt, former president of the New York club, and a quondam occupant of the A. A. A. presidential chair, an orator of no mean repute in automobile circles, a proverbially persuasive talker, went to Chicago recently and with approved credentials laid before the Chicago Automobile Club a plan to unite with it in an effort to assume the control of racing in this country, as shown by the coming effort at Savannah.

The civic pride of the Chicagoans was a bit touched at the idea of practically acknowledging the New York Club as a leader. The chance to communicate with the European bodies through the New York club's foreign connections did not somehow appeal to them either; hence the foregoing resolutions.

Secretary Sidney S. Gorham, of the Chicago Automobile Club, put the opinion of his fellows in a nutshell when he said: "We declined the invitation of the Automobile Club of America because we felt the interests of motoring would be best served by remaining loyal to the A. A. A. The latter is an independent body for national control of the sport. Just because the Automobile Club of America saw fit to break away from the New York State Automobile Association, and, therefore, the A. A. A., is no reason why the Chicago Club should do so."

The Chicago club, as might be expected, did not see the Americanism, common sense, or logic of the sport in this country being controlled by several, much less one or two clubs, as opposed to government by a national organization of autoists.

It may be interesting and pertinent to note in this connection that advices received from the directors of the American Automobile Association, in practically all of the large cities of the country, including Philadelphia, Baltimore, Boston, St. Louis, Cincinnati, Cleveland, Detroit, Milwaukee, Minneapolis, St. Paul, Pittsburg, Buffalo and Kansas City, indicate that their clubs are loyally supporting the American Automobile Association and are opposed to any movement like that suggested to the Chicago Automobile Club by the New York organization.

Incidentally, it may be stated, with due authorization that the report that recently found some publicity that an alliance between the New York and Chicago clubs had been consummated was incorrect, the two clubs having merely agreed to grant one another's members reciprocal clubhouse privileges.

TO CONVERT PALACE INTO FAIRYLAND.

A complete surprise is promised in the decorations of Grand Central Palace for the A. M. C. M. A. international show, December 31 to January 7, for which Parisian and American artists are now engaged in making the designs.

"It is a safe bet that the Palace will take on a far more beautiful appearance than ever before," says H. O. Smith, chairman of the show committee. "Decorating schemes have already been submitted and others are in process of perfection that will turn the Palace into a veritable Fairyland. It is our intention to have the Palace show eclipse anything of its nature ever held before. Everything that money and artistic effects can do will be embodied in the next show. We are giving all artists, designers and decorators a free rein, and I expect that this competition will give us the best there is in them."

THOMAS AGAIN LEADS RACE TO PARIS.

Despite the lead of two or three days that the Protos had gained over the Thomas, due to the accident the latter sustained in bumping over unballasted ties, the Americans have again overtaken their German competitors at Omsk, Siberia, according to advices received by the New York *Times*. But the Protos was caught up with only after a most discouraging struggle, in which everything was sacrificed to make time, the Thomas being driven 19 or 20 hours out of every 24, Miller relieving Schuster at the wheel. On arriving at Omsk, it was learned that the Germans had broken down 30 miles east of Kainsk, 208 miles to the rear. Omsk is 3,408 miles from Vladivostok and 5,872 miles from Paris, and, by arriving there June 29, Schuster has made the run in four days less time than Borghese did in the Itala in the Pekin-Paris last year.

FRANCE ALL AGOG AWAITING THE GRAND PRIX

DIEPPE, June 22.—Dieppe, eighteen days from the race which will attract the attention of the whole world, is a dull city. The triangular set of roads beginning up on the high chalk cliffs just on the edge of the town has been closed to all racing cars and is being jealously watched by gendarmes in order that fast touring cars shall not develop all the power that is in them. According to the official notice sent out by the club and the local authorities all automobiles must travel over this course, capable of speeds of 100 miles an hour, at a rate of travel not exceeding 12 miles in the 60 minutes.

As European drivers would have difficulty in throttling down their speed monsters to such an extent, they have abandoned the course to the army of workmen who, under the direction of the Dieppe municipality, are endeavoring to put the triangular course into a condition satisfactory to the critical Racing Board of the Automobile Club of France. When the club officials came up last week for their formal examination of the course, they were disappointed—perhaps it would be more correct to say they were vexed—and bluntly told the authorities, who had undertaken to remake the roads, that they were not at all up to the standard. If fine weather continues during the next eighteen days the Dieppe course may be a perfect tarred ribbon of road for a distance of 77 kilometers; if rain falls there will be spots strewn with loose stones and patches which cannot be considered good for speeds of over 70 miles an hour.

Though the Dieppe course has been deserted by every European contestant, America remains on the ground. Every morning around 9 o'clock a big red Thomas flyer slips out of the Grand Hotel garage, picks a way along the fish-strewn pier and crosses over the two wooden bridges spanning the docks. Dieppe is still too nautical to be automobile, and her population is as ignorant of the ways of the benzine buggy as the natives of any fishing

PRINCIPAL FEATURES OF THE RACING CARS ENTERED FOR THE FRENCH GRAND PRIX, JULY 7.

CAR	Drivers	Engine	Stroke	H.P.	Carhureter	Gooling	Ignition	Clutch	Transmission	Drive	Wheels	Track	Wheelbase

hamlet in wild Brittany. Generally, when the big red Thomas—or any other car, for that matter—emits its first honk at the beginning of the narrow bridge, half a dozen tugs of war immediately commence between as many pairs of mariners engaged in transporting a heavy basket of fish. Sometimes it is a baby carriage containing one speck of humanity and some of the products of the briny that obstructs the way when the first honk goes forth. Then it is a struggle between the half dozen relatives as to which side of the road shall be closed. The men will pull to starboard, the women will pull to port, while the baby threatens to fall overboard. A loud roar of laughter from Strang at the wheel of the immobilized Thomas, and the struggling group, realizing that there is nothing to fear from the big auto, stop to respond with a smile at their own foolishness and fear. The baby is saved, but the next time it meets an auto on the bridge it will be the center of the same scared group.

As there will be no possible chance of the American racing car going on the course until the moment it is given the order to start in chase of the fourteen ahead of it on July 7, Strang has made a practice of going around the course on a touring car from three to four times a day. Certainly the 1908 Grand Prix will be the most keenly contested automobile race the world has ever seen; the cars have been prepared with a greater care than ever before, and the drivers are more highly trained. For this reason alone it is essential to know the course so thoroughly that there will never be a moment when the nature of the stretch ahead cannot be recalled. There is some caution needed in this daily training, for, although there are few cars, there are numerous tar wagons and a few keen-eyed gendarmes at Criel.

Because it is the only car on the road the Thomas Flyer has been frequently called upon to act the rôle of the good Samaritan. One afternoon it was a long-robed priest with his clerical garments pinned around his legs, who was carried back to the garage from an outlying spot on the course, where his motorcycle had suddenly decided to go out of business. Half an hour's patching by the team of mechanics at the garage and the clerical gentleman had scrambled on his saddle and was tuf-tuffing down the road, after struggling to return thanks in broken English. Next afternoon is would be the village postman, who, for the first time in his life, had a practical experience of how nine kilometers could be covered in nine minutes. On the next round the gendarme himself would plead to be taken home faster than his legs could carry him, or the dignified government gamekeeper would make a sign that he would like to be helped along. None of them were refused.

Although there are no racing teams on the course, practically every firm has secured headquarters either in Dieppe or in the little towns and villages of the neighborhood. Now and again an entire team will run up from Paris on a practice trip, stay a few hours and disappear with a formidable roar. Gabriel, Rigal and Hautvast, who made one of these appearances this week on their Bayard-Clement cars, claim that they have covered the kilometer in 21 seconds, which is equal to the tremendous average of 106 miles an hour. Duray, of the Dietrich team, whose trial trips have been of no less than 500 miles a day, claims about the same period. Szisz, chief of the Renault team, puts in lower claims for speed, but is none the less confident of winning, the three cars being marvels of regularity. Benz, Fiat and Itala are known by the French to be dangerous rivals who might again rob the tricolor of victory.

There is very little doubt but that the speed average of 70.6 miles an hour established last year will be broken next month, providing, of course, that weather conditions are favorable. It will be a remarkable performance to thus break the record, for, under the 155-millimeter rule, the cars have on an average been reduced in bore by one inch. Naturally, under such rules, the stroke exceeds the bore, all the engines, with the exception of the British Weigel and the American, being long-stroke, slow-speed engines. In the voiturette race to be held the previous day, exaggerated strokes are well in evidence, some of the little single cylinder cars, with a bore of slightly less than 4 inches, having a stroke of 7 1-2 inches and an engine speed of 2,200 revolutions a minute. Horsepower is rated anywhere from 14 to 22, and maximum speed is estimated at 55 or 56 miles an hour.

THREE UNBROKEN IN ALBANY RUN.

ALBANY, June 26.—Three of the seven contestants in the six-day endurance run of the Albany Automobile Club, which ended here to-night, completed the test with perfect scores. They were Joseph Taylor, Locomobile; Matthew Van Alstyne, Peerless, and Edward Wright, Elmore. All three competed for the McClure cup with sealed bonnets and evolved with seals unbroken. The Locomobile for the third successive year made the run with a perfect score. Of the seven cars entered, five were from Albany, one from Ballston, and one from Troy.

HIGH-CLASS SPORT PROMISED AT ELKWOOD.

A high-class list of nominations has been made for the Fourth of July meet at Elkwood Park, Long Branch. In the sprint line a five-mile match race is featured with Harry Levey's Hotchkiss, driven by H. J. Kilpatrick; Walter Christie's direct-drive racer, piloted by Joseph Seymour, and E. R. Hollander's Fiat Cyclone, with George Robertson at the wheel.

In the 50 and 100-mile races, included among the entrants are Harry Michener, Lozier; Ralph de Palma, Allen-Kingston; Georges Renault, Mercedes; Maurice Bernin, Renault; Al. Poole, Isotta, and Stewart Elliott, American.

ALFRED REEVES IS NOW OUT OF DANGER.

Alfred Reeves, general manager of the American Motor Car Manufacturers' Association, who was operated upon for appendicitis at St. John's Hospital, Yonkers, last week, is now entirely out of danger. He expects to be able to leave the hospital for his home next Sunday. Later he will go to Lake Mahopac for a fortnight to recuperate.

WORCESTER'S ORPHANS HAVE OUTING.

WORCESTER, MASS., June 28.—The annual Orphans' Day outing was observed by members of the Worcester Automobile Club on Friday last. Only thirty-five cars were secured by the committee, who were consequently greatly disappointed. The date selected was only made known four days in advance, and in addition the dedication ceremonies of the memorial statue of the late Senator Hoar fell on the same day.

The committee, therefore, found it necessary to shorten the trips for the little waifs and to make the cars return and take another load. Because of several collisions during the parade last year, the committee this year had the cars report at the club quarters, and there assigned them to certain orphanages, and after they had got their loads they could go anywhere they cared to, there being no regular route.

NEW YORK CLUB'S "IDEAL TOUR" ENDED.

The survivors of the "Ideal Tour" of the Automobile Club of America, a dozen cars in all, reached New York on Sunday, having covered some 900 miles of road, for the most part in New England. The last day's trip was a jaunt of 102 miles from Waterbury, Conn., through Woodbury, Newtown, Danbury, North Salem, Cross River, White Plains and Yonkers.

Thursday's run was to Portsmouth, N. H., 81 miles. On Saturday the tourists made a 157-mile journey to Boston. At this point they numbered but nine. They were here reinforced, however, by Daniel Daly, Matheson and F. D. Hughes' Ford.

The participants pronounced themselves well pleased with the tour. There is talk of the club's repeating the experiment in the autumn, over a route of similar interest and good roads.

THE FACTORY BEHIND GREAT ARROW.

Under this title, the George N. Pierce Company, of Buffalo, N. Y., have just issued one of the most elaborate and attractive pieces of publicity work that an automobile company has ever undertaken. Descriptions of plants are nothing new—in fact, are all too familiar, but seldom does such a work show the painstaking care and attention that is revealed in this latest effort of the Pierce Company. It is a book measuring 10 by 12 inches, substantially bound in board covers of a dark neutral green, offset by the lighter green and gilt of the title, "The Factory Behind the Great Arrow Car," and the ornament emblazoning the cover. Most of its 70 odd pages are devoted to a description of the new Pierce plant which is a model of its kind. It is situated on the old Pan American exposition grounds and its various buildings are fitting companions to the artistic structures of a more enduring type that were left as a memento of the exposition held in that city during 1901.

The description of the various departments of the factory and its systems is by John Foord and is profusely illustrated, showing most of the important steps in the construction of the Pierce Great Arrow cars. The administration building, power plant, stock rooms, the machine and assembling departments, are each taken in turn and shown in detail, the reader of the work really enjoying the next best thing to a personal visit of inspection, to which the Pierce works are always open. Right up to the very last step in the handling of the car at the works, its placing in the freight car for shipment, is shown and then the remainder of the work is devoted to the Pierce product, with a pictorial introductory showing its evolution from 1901 down to the present.

YALE BOYS TO CROSS CONTINENT TWICE.

Charles T. Crocker, of San Francisco, and M. C. Scott, both students at Yale, left New York on Thursday in a 40-horsepower runabout with the intention of making a round trip to the Pacific Coast before college opens again next autumn.

The car has been especially equipped for the journey. There is one small seat behind for the mechanic, the remainder of the space behind the double front seat being taken up by a large provision box and some extra oil and gasoline tanks. The extra gasoline tanks have a capacity of 70 gallons of fuel and the extra oil tanks have a capacity of 30 gallons of lubricant. Two long boards to be used when the car gets into deep sand or into mud holes are carried on the car, along with several coils of wire rope. The tourists are carrying guns, ammunition and fishing tackle with them, as they expect to do considerable hunting and fishing.

QUAKER CITIZENS GET MORE TAXICABS.

PHILADELPHIA, June 20.—"We are now well launched in our business," said President John C. Hinckle, of the Pennsylvania Taximeter Cab Company to THE AUTOMOBILE representative last week. "With a dozen cabs already at work, we are to get a half-dozen more during the present week, and will have 25 at work by July 15. We are so situated that we can easily increase our equipment with the growth of the business."

The company as now organized has the following officers: President, John C. Hinckle; vice-president, Edward Malpass; secretary-treasurer, William C. Wilson; board of directors, John O. Gilmore, Mahlon Newton, John H. Simons, Claude Bennett.

SWINEHART INCORPORATES IN ILLINOIS.

The Swinehart Clincher Tire & Rubber Company has been granted a license to do business in Illinois, with a capital stock of $200,000, headquarters to be in Chicago. According to officers of the company no part of the plant is to be moved, but the object is to be able to begin legal proceedings to prosecute the alleged infringement of certain clincher tire patents that the Swinehart Company holds. Similar proceedings have already been started in Cleveland.

ANOTHER TIRE FACTORY FOR AKRON.

AKRON, O., June 29.—The Buckeye Rubber Company has added one more tire manufacturing plant to the many in this now celebrated city of tires in establishing a new factory for the special output of pneumatic tires, the company having decided to extend its business to that line. A building has just been put up adjoining the company's present plant. It is three stories high and 231 feet long by 40 feet wide. It is being equipped with the latest tire-making machinery, and S. S. Miller, the company' superintendent, says that manufacturing will be started in two months. The pneumatic tire to be manufactured will be a standard clincher type and has been made in an experimental way for the last year, being placed on the market in limited quantities. The success of the product led the company to take the present step.

The new factory will be devoted entirely to auto tires. The Buckeye company has its general offices in New York, and it has for some years been manufacturing in large quantities the well-known Kelly-Springfield solid buggy tires. It has been led to take the present step by the vast increase in the automobile tire business, which has been responsible for the great growth of the Goodrich, Diamond, Firestone and Goodyear factories, as well as of the Swinehart, Motz and other Akron makes, all of which have made Akron the chief rubber tire city of the United States. At present the tire plants are running day and night and doing the greatest business in their history, despite the recent setback that caused many other plants to shut down last fall.

CONTINENTAL GIVES PRIZES IN TIRE CONTEST.

What was probably a unique contest in automobiledom on this side of the water was held at the salesrooms of the Continental Caoutchouc Company, 1788 Broadway, New York, last Friday. The object was to determine how quickly a damaged tire could be removed and replaced with one of the new Continental "ready-flated" type, such as was used in the Briarcliff race this Spring. It was the first event of its kind ever held in New York City, and the attendance was consequently large. Each contestant was obliged to loosen and remove the demountable rim carrying the tire and place on the wheel in its stead another similar rim with an inflated tire on it, ready to run, this simple operation being all that is necessary with the Continental "ready-flated" equipment. The prize of $10 was won by R. Piccoli, who turned the trick in 59 seconds, the second prize of $5 going to Felix B. Faust.

SELDEN TO HAVE A BRANCH IN NEW YORK.

One of the latest comers to the metropolis to be represented by a branch house will be the new Selden car, which is the product of the Selden Motor Vehicle Company, of Rochester, N. Y., and the advent of which caused quite a ripple at the last show in the Garden, owing to the very low price the makers have put upon it. The Selden has been represented in this territory by the Palmer & Singer Manufacturing Company since early in the spring, but the makers have now decided to open a branch of their own, which will be located at 41 West Sixty-third street. For the present, it will be in charge of E. T. Birdsall, the designer of the car and chief engineer of the company.

PAGE COMPANY TO BUILD CARS AT PROVIDENCE.

PROVIDENCE, R. I., June 30.—The Page Motor Vehicle Company, recently chartered under the laws of Rhode Island, will begin operations at once at its headquarters, 288 Dyer street. It is expected that the first instalment of cars will be turned out in about three months. The location of the new plant has just been decided upon, but the manufacturers will not give out the detail of construction at present. The officers of the new company are: President, Dr. O. Fletcher; vice-president, Arthur A. Page; treasurer, Samuel J. Green; secretary, H. B. Vandergrift, the same officers also constituting the board of directors.

WHAT THE AUTO CLUBS ARE DOING JUST NOW

AUTO CLUB AND TEAMSTERS' UNION FUSE.

MINNEAPOLIS, MINN., June 29.—In the hope of securing better roads, the Minneapolis Automobile Club has entered politics. In conjunction with the Minneapolis Teamsters' Union the club will work and vote for the election of men for aldermen who, in the opinion of the club, will help the good road cause. The Automobile club has nearly a thousand and the teamsters 2,000 members. Theodore Wirth, superintendent of the Minneapolis parks, has the distinction of having been the first person elected to an honorary membership of the Automobile Club. He will assist in the good roads campaign.

From now on women will be eligible to membership in the club, action to that effect having been officially taken. The initiation fee of $25 will be waived, for a time at least. There are fifty women in this city who own automobiles.

Owing to the date for the Chicago hill climb being set for August 14, the tours and contest committee of the Minneapolis Automobile Club has decided to postpone the contest here until a date after the Windy City contest, so that the cars used there may be brought here.

PITTSBURGH CLUB'S TOUR TO BUFFALO.

PITTSBURGH, June 30.—Arrangements have been completed for the Automobile Club of Pittsburgh's run to Buffalo to the legislative and good roads convention. It will start next Sunday morning from the clubhouse, Baum and Deatly streets. Three pilots will precede the caravan, Edward J. Kent, starting at 7 A. M.; Edward Kneeland, at 8 A. M., and W. N. Murray, at 8.30 A. M. The tourists will rendezvous at Silver Creek, three miles west of Buffalo, on Monday, at 2.30 P. M., where they will be joined by the other clubs of Western Pennsylvania so as to enter Buffalo in a body. The route to be taken follows: East Liberty, 0 miles; Zelienople, 30; Mercer, 62; Sheakleyville, 77; Meadville, 94; Saegertown, 102; Cambridge Springs, 110; Erie, 130; Fredonia, 178; Silver Creek, 190; Buffalo, 224.

This division is but one of the three that are being organized by the Pennsylvania Motor Federation.

IN AND AROUND CONNECTICUT'S CAPITAL.

HARTFORD, June 30.—The gymkhana of the Automobile Club of Hartford, which was held at Charter Oak Park in connection with the Hartford Hospital benefit, was a most successful affair. About four thousand were in attendance. Practically all came in motor cars, many of which were very tastefully decorated. There were six events on the program, three for ladies and three for gentlemen. These were run off on the broad lawn under the shade trees.

The autoists of Torrington will soon form an automobile club, and it is expected that definite action will be taken within a few days. As soon as the formal organization takes place the club will make application for membership in the State association and the American Automobile Association.

SALT LAKE CITY AUTOISTS ORGANIZE.

SALT LAKE CITY, June 27.—With every prospect of success and a very good chance of soon having their own clubhouse, local owners have organized the Salt Lake Automobile Club.

Among those present at the meeting were James J. Brosoit, Van D. Spalding, O. W. Powers, O. H. Hewlett, Dr. H. N. Mayo, J. E. Jennings, C. R. Pearsall, R. W. Salisbury, Frank Botterill, Lewis S. Hills, L. B. McCornick, J. Frank Judge, H. A. McCornick, Dr. H. D. Niles, A. C. Ellis, Jr., F. A. Babcock, Jr., L. L. Terry and Joseph Nelson, H. W. Walker, F. C. Schramm and Mayor J. S. Bransford telephoned to have their names added to the list of members.

SPRINGFIELD, MASS., TO HAVE HILL CLIMB.

SPRINGFIELD, MASS., June 30.—The Automobile Club of Springfield has voted to hold a hill-climb over the Wilbraham Mountain road, a distance of only a few miles from this city, some time next autumn. The directors of the club have given the committee in charge carte blanche, so far as expense is concerned, and it is expected to make this test one of the most memorable in this kind of competition.

The Wilbraham Mountain road has but one place that could be called dangerous, and this will be eliminated at an expense of two or three hundred dollars. The grade, which, it is believed, will average about 12 per cent., runs in some places as high as 23 per cent. It will be surveyed at once. The test will be classified according to horsepower and selling price, and valuable cups will be offered as premiums.

THE BLUE GRASS CLUB IS A HUSTLER.

LOUISVILLE, KY., June 30.—The Louisville Automobile Club's president, Pike Campbell, in his monthly letter to the members for June, expresses confidence that by the annual election the club's roster will show 250 members, 37 new names having been added to the roll since April 1. Every effort is being made to add influential men to the roll to assist the club in its campaign against drastic laws and ordinances.

The club has already accomplished much. The toll on the Kentucky and Indiana bridge has been reduced. Holes in the streets have been repaired. Arrests and fines have been averted. The orphans were given their annual ride. How hard the club's officials are hustling may be judged from the fact that during the past month 2,200 communications were mailed from the secretary's office.

PEARSALL BRIDGEPORT ORPHANS' HOST.

BRIDGEPORT, CONN., June 27.—Orphans' Day was celebrated last week by the Automobile Club of Bridgeport giving 100 orphans a ride around the city and suburbs ending at the handsome estate of Thomas W. Pearsall at Black Rock. Mr. Pearsall's large stone garage was profusely decorated with flags, and the children were entertained by a fine collation provided by him. Music on the graphophone was furnished by Mrs. Pearsall. Twenty-eight large touring cars were used in the trip, the ride being in charge of F. W. Bolande, secretary of the automobile club; Ralph M. Sperry, chairman of the contest committee, and Bernhard Setzer. This is the second time that Mr. Pearsall has entertained the orphans in this manner.

ST. PAUL CLUB IS TO AID THE POLICE.

ST. PAUL, MINN., June 29.—By official action and formal resolution the St. Paul Automobile Club has decided to do all it can to stop the reckless handling of automobiles by making each one of its members a monitor, whose business it will be to report and bring about the punishment of offenders of the speed laws. The organization will also do what it can to annihilate the meanest of all automobile drivers—the fellow who, following an accident, turns on the throttle and speeds away. A reward of $50 for information leading to the identification of every such offender. A reward of $50 will also be paid for the arrest and conviction of the thief who steals a machine belonging to a member of the club.

FLORIDIANS TO RAISE FLAG ON FOURTH.

DAYTONA, FLA., June 29.—The Florida East Coast Automobile Club will raise its new flag on the Fourth of July. The club has recently spent over $1,000 in improvements on its clubhouse on the famous Ormond-Daytona racing beach.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The salesmen of the Franklin factory will take their annual vacations July 3 to 20. Immediately after their vacations the Franklin salesmen will go to the factory at Syracuse, N. Y., for the annual salesmen's conference.

Alexander Winton has decided not to allow any chauffeur in the $2,500 Six-Teen-Six contest to go unrewarded. After the judges have chosen the ten money winners, special additional awards will be made to the remaining contestants. Reports already received indicate that the final records will show some exceptionally fine performances to the credit of the Six-Teen-Six.

Within about two weeks the Speedwell Motor Car Company, Dayton, O., will have completed another spacious shipping warehouse which is now being erected on the spur track which the Big Four Railroad bas installed. The new building will be used for a shipping warehouse, and is of concrete and steel construction. It is 200 by 30 feet. The company still employs two sbifts of men, and the output for next year, according to General Manager Loomis, will be about five times that of the present year.

According to the K-W Ignition Company, Cleveland, O., the "sun never sets on the K-W magneto," as they have now made sbipments to points all over the globe, a number of the machines having been sent to China, India, Japan and the Pbilippines, as well as to South American countries. The K-W magnetos are enlisting for themselves a host of enthusiastic users in this country from coast to coast, and autoists who have oncc placed one of them on their cars would never think of again returning to a battery for ignition.

According to his usual custom, Colonel James H. Sprague, of Norwalk, O., who has achieved for himself the title of the "canopy autocrat," will hold open house on the Fourth, and with his customary generosity has extended an invitation for every one in the trade to help him celebrate Independence Day in a much more fitting, if less noisy manner, than is usually followed. The invitation takes the form of a giant cracker, and beside extending a most cordial request to make merry with the Colonel from 2 to 6 P.M. on that day, includes an apt picce of poetry entitled "Smile."

With its last phenomenal victory on Skippack Hill, in which it made the unprecedented speed of 74 2-5 miles per hour up a steep grade of 1 1-5 miles, the Great Chadwick Six won the culminating event of a long line of hill-climbing victories that has seldom been approached either here or abroad. In fact, a careful review of existing rccords is said to show that the Chadwick's average speed on Skippack was faster than has ever been attained previously by an automobile in any hill-climbing contest. In the past month or so the Chadwick stock car has swept away all records, defeating by generous margins all competitors in the four big hill climbs of the year, Wilkes-Barre, Worcester, Cleveland and Skippack, in the last named of which a number of famous stock cars and racing machines were beaten by 16 2-5 seconds.

Chairman Frank B. Hower announces that the two pilot and confetti cars selected for the fifth annual A. A. A. reliability touring contest are a six-cylinder Premier "45" touring car and a Reo "20" touring car. A six-cylinder Premier "45" was used in successfully laying out the 1908 route early in May, last, when the heavy rains, deep mud and rough country roads put the pathfinding party and car to a severe test. The companion pilot car—a Reo "20"—is a $1,250 model, one of which created the great sensation in the 1907 Glidden reliability touring contest by being the only car of 83 starters selling under $2,250 which finished with a perfect score, and then made its 500-mile official non-stop dash immediately thereafter, from New York to the Jamestown Exposition, in 23 1-2 hours.

The Renault people intend eventually to occupy the same place in America in the taxi business as thcy now do in France, where 2,000 cabs are in daily use in Paris streets, while the Renault factory has an order for an additional 1,000 cabs for another Paris taximeter company now forming. London is a close second, with 1,500 cabs in daily use in her streets, and an order already placed for 500 more for a new English company. Paul Lacroix, General Manager of Renault Frères, announces that the Auto Taxicab Company of Chicago, recently incorporated, to use Renault taxicabs exclusively, have placed their first order for 50 cabs. In New York the Motor Taximeter Cab Company, incorporated with a capital of $150,000, has taken over the entire Renault Taxi Service, heretofore opcrated by Renault Frères, and has ordered 50 more cabs. They use Renault taxicabs exclusively, two types, 10-14 horsepower, 4 cylinders, and 8-10 horsepower, 2 cylinders, the experience of three years in Paris showing the Renaults are the only cabs that successfully stand the strain.

NEW AGENCIES ESTABLISHED.

The Schacht auto buggy has made its appearance in Philadelphia, D. Applegate & Company. 336 North Broad street, having secured the local agency for the high-wheel vehicle, the first of its kind to be exploited in the Quaker City.

The E. L. Leinbach Auto Company, 2312 Madison avenue, Baltimore, local agents for the Stearns car, have added the Oldsmobile to their list of agencies there, while the Arbee Auto Company, William C. Blome, president, has just opened up in this city. Tbe firm has the Baltimore agency for the Moon car.

Having abandoned its agency representation in Philadelphia, the Matheson Company, of Wilkes-Barre, has been quietly looking around for a suitable location for thc establishment of a branch house. The matter was settled last week by the announcement that permanent quarters had been secured at the northwest corner of Broad and Green streets, and that W. Wayne Davis had been appointed manager of thc new Quaker City branch.

Since the announcement of the new Chalmers-Detroit car at $1,500 and the Chalmers-Detroit Forty for 1909, the Chalmers-Detroit Motor Company has renewed contracts and closed up a great many dealers for the coming year. Among those who have signed contracts within the last week are Charles B. Shanks, formerly sales manager of the Winton Motor Carriage Company, who takes Cleveland and northern Ohio; I. H. McDuffee, a veteran auto man, who will handle the Chalmers-Detroit line in Colorado, Wyoming and New Mexico, with Denver as his headquarters; C. E. Whitten, of Boston, Capital City Garage, of Montgomery, Ala.; The W. L. Hibbard Motor Car Company, of Milwaukee; E. P. Moriarty Company, of Kansas City; Fort Dodge Automobile Company, of Fort Dodge, Ia.; Chas. I. Durheim, of Muskegon, Mich.; Newark Garage & Repair Company, of Newark, N. J., and the Barclay Auto Company, of Minneapolis.

PERSONAL TRADE MENTION.

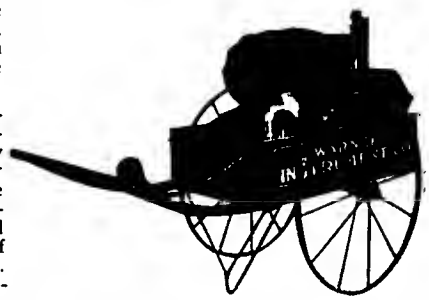
Henry Lomb, one of the founders of the Bausch & Lomb Optical Company, Rochester, N. Y., passed away on June 13, in that city. Mr. Lomb was almost eighty years of age, and his long and most successful career closes a line of achievements in the optical world that have seldom been equaled.

Charles W. Churchill, former manager of the Winton branch at New York, has gone to Clevcland to take up his new duties as sales manager of the Winton Motor Carriage Company. Charles Brown, manager of the San Francisco branch, will leave a fortnight hence to take Mr. Churchill's place.

James F. Fairman, for some time identified with the sales force of the New York & New Jersey Lubricant Company, New York, has severed his connection with that concern, to take a position with the Wilson Trading Company, 179 Greenwich street and 46 Cortlandt street, wholesale and retail dealers in auto tires, sundries and the like.

WARNER'S "AUTO-METER ARTIE."

After years of experience with the average office boy, one firm in the West, the Warner Instrument Company, of Beloit, Wis., have hit upon a clever scheme by which they have successfully tamed that specimen of procrastination. The Warner Company have fitted their mail cart with a Warner Auto-Meter and odometer combined, and by this means are pretty nearly able to tell just where the office boy has been when he returns with the mail cart.



According to President Warner, of the Warner Instrument Company, it is now a matter of record around the Warner office that since the autometer was placed upon the car the boy has become greatly interested and takes great pleasure in trying to make record runs to the post office, and the speed he can get out of the two-wheeled cart and the stories he tells have made him the envy of the other urchins who fill similar rôles in the business offices of Beliot's factories. It is also noticeable that the cart is equipped with a large automobile born to enable him to make speed.

G&J TIRES

That Have Run 8454 Miles

¶ The car is owned by Mr. C. R. Forth, of Mansfield, Ohio. He has written us as follows: "The distance I have covered with the tires you got a photograph of is 8454 miles. They have never been punctured and have been pumped up only once."

¶ Good tires have much to do with the economy as well as the comfort of automobiling. To equip with G & J tires means absolute satisfaction to the owner as well as perfect security in the knowledge that no better tires are made.

¶ If you need any new tires this season and are still undecided which are the *best*, drop us a line and we will give you some surprising facts.

TRUFFAULT-HARTFORD
SHOCK ABSORBER

For "RUFF ROADS"
For HILL CLIMBING
For COMFORTABLE MOTORING

Motoring without the jolt, the jar, the vibration, the shaking up, even though the road be rough—that's the kind enjoyed by those who ride in cars Truffault-Hartford Equipped. Thousands ride in comfort on

TRUFFAULT-HARTFORD SHOCK ABSORBERS

Why not you?

They save springs, save tires, save car, insure comfort. They keep the wheels of the car on the ground, preventing lost traction and waste of power for this reason, saves wear and tear to the tires because with the bouncing of the wheels eliminated, there is little possibility of skidding and no occasion for frequent use of the brake.

Made in three sizes to fit any car, $60.00, $40.00 and $25.00.

Ask us to send you a booklet that tells all about it. Address Dept. C.

MAYO RADIATORS

Mayo Radiators perform their functions well under all conditions, and conditions at times are exacting. It is at just such times that Mayo quality asserts itself.

Most of the High Grade Cars built in America use Mayo Radiators as regular equipment

There's a Reason

Send for Catalog Showing 1909 Designs

MAYO RADIATOR COMPANY **New Haven, Conn.**

Renault Stock Runabout that broke world's 24-hour record.

RENAULT

"The Car"

WHY is the **RENAULT** everywhere acknowledged to be the Standard of Automobile Perfection?

BECAUSE the **RENAULT** excels all other makes of Automobiles in Speed, Endurance and Reliability, which are the three most important requisites of an Automobile.

SPEED. The **RENAULT** holds the World's Record for 100 miles. On March, 1908, at Ormond, Florida, M. G. Bernin drove a 60 H. P. **RENAULT** 100 miles in 1 hour, 18 minutes and 56 1-5 seconds, an average of 82 1-2 miles per hour; lowering the previous World's Record by 2 minutes, 54 seconds. Racing Boards have decided that a racing car, to be called a racing car and not "a freak," must run 100 miles at an average speed of at least 60 miles an hour. Therefore the winner of the 100-mile contest earns the Blue Ribbon of Speed.

ENDURANCE. The **RENAULT** holds the World's Record for 24 hours.
On September 6, 1907, at Morris Park, a 35-45 H. P. **RENAULT** stock car won the 24-hour race, covering 1,070 miles at an average speed of 45 miles per hour; and established a World's Record for a single car in competition on a mile track. The 24-hour race is the most exacting test of the endurance qualities of a car. No severer strain can be put upon a motor than 24-hours' consecutive racing. That is why the 24-hour race is the Blue Ribbon Event of Endurance.

RELIABILITY. The name **RENAULT** is synonymous of Reliability.
A 1905 **RENAULT** can still be run from New York to Chicago without a hitch. A **RENAULT** always keeps its value. A 20-30 H. P. **RENAULT**, 1905 model, after three years' use, sells for $3,000. The initial cost of a **RENAULT** is a little more than that of the high-grade American car, because of the 45 per cent. import duty. But the superiority of workmanship and material are worth more than the difference.
RENAULT cars from 20-30 H.P. up are sold with a guarantee to make the run between New York and Chicago. All **RENAULT** cars carry a written guarantee for one year.
FURTHERMORE, we guarantee the **RENAULT** for life against any defect in either workmanship or manufacture.
What American car will make that statement?

SILENCE and **SIMPLICITY** are other leading attributes of the **RENAULT**. Try for yourself and see the difference.

VOL. XIX NEW YORK—THURSDAY, JULY 9, 1908—CHICAGO No. 2

THE AUTOMOBILE

Rain failed to stop Independence Day Meet at Long Branch

Elkwood Park's Wide Course Showed Up In Magnificent Shape When the Competing Cars Faced the Starter.

HISTORIC old Monmouth county, New Jersey, famous as the birthplace of Moll Pitcher, of the Revolution, and of Arthur Augustus Zimmerman, greatest of all bicycle riders, too, gave to motordom on the Fourth of July a multi-millionaire meet. Crusty old Jupiter Pluvius frowned upon it and stormed upon it, but his cloud bursts could not quench the enthusiasm of the Guggenheims, the Lewisohns, W. E. D. Stokes, and the other plethoric promoters a little bit nor stop for more than a quarter of an hour at a time the racing at the old Elkwood Park mile trotting circuit at Long Branch.

The promotion of the meet was a praiseworthy bit of simon-pure sportsmanship on the part of the automobile enthusiasts of the Jersey coast summer colony. They spent money without stint to insure first-class sport. For a fortnight before the Fourth the track was worked and a week ahead was treated with 9,000 barrels of oil to insure against dust. Liberal purses were put up to attract the best cars and drivers in the metropolitan district, and the response was generous. The grandstand was elaborately decorated with flags and bunting. The visiting racing men and scribes were brought to Long Branch in special parlor cars, lunched elaborately at Pannaci's and sent away full of choice viands and good cheer after a rousing clambake at Pleasure Bay.

The Copper Crœsuses and money magnates were not looking for any profits either for themselves, having in advance promised the surplus proceeds to the local hospital. How much of a surplus the rain allowed is to a considerable extent dependent on the truth of a story that received wide circulation and was vouched for by Tom Moore, who managed the meet, to the effect that the management with characteristic business prudence had insured against one-tenth of an inch of rainfall with the Lloyds, accepting odds of $7,500 to $1,500. There was little doubt at the track that day that one-tenth of an inch had fallen. An hour before the time announced for the start, the heavens twice opened and remained with full water power turned on for a quarter of an hour each time. Then the sun peeped out in a half-hearted, dubious sort of way, yet promisingly enough to jolly several hundred automobiles and several thousand enthusiastic foot, trolley and 'bus passengers to start for the course.

Arrived at Elkwood Park, it really did not look so bad or impossible for racing after all. To be sure, there were little lakes of mud amid slimy stretches of mingled oil and water. A postponement of an hour was announced to permit the track to dry out, and this helped matters considerably. It had been well rolled and soon was in fairly good racing shape, as the times will show.

Elliott Rests His American 10-mile Handicap Winner.

As the afternoon wore on and the weather clerk kept the rain in fairly good check, barring several showers not too heavy to scare an enthusiast, the crowd grew in numbers until the seats on the little grandstand at $2 per were all taken, the tiny bleachers were entirely filled, and several thousand railbirds lined the fence. On the lawns at either side of the stand close to half a hun-

Officials Confer on Postponement After a Heavy Shower.

dred cars were parked at $10 each, scores of automobiles were in the open field near the clubhouse at the head of the stretch, and as many more were drawn up along the fence on the backstretch. Conservatively estimating, there were 300 cars and 5,000 people on hand. With good weather both of these figures would undoubtedly have been doubled. The Jersey coast, be it remarked, is one of the biggest automobiling centers in the country in summer, and its hot-weather colonists are accordingly in an excellent position to command every facility for the holding of an event of this character, even including long-since abandoned horse racing tracks as a venue for a meet.

The races all had good sized fields of really fast cars and the contests were hard and closely fought. It was mean that that cantankerous Jupiter Pluvius had such a grouch on. The management and the sport put up deserved better treatment at his hands.

The outcome, however, was encouraging enough to make it pretty sure that the Fourth of July meet at Elkwood Park will hereafter have a permanent place on the racing calendar.

Two accidents of the bone-breaking variety marred the meet. Both occurred in the 50-mile race. The first one was when an Autocar, driven by C. E. Fisher, and a Stearns, piloted by Arthur Warren, came into collision in rounding the south turn. The Stearns was overturned, throwing out the crew. Warren had his collar bone and three ribs broken, and James Crawford, his mechanic, had his leg so badly crushed that it has to be amputated below the knee. A few minutes later M. R. Guggenheim's Renault, driven by Al. Bellows, lost a tire and dashed through the fence. Henry Myer, the mechanic, evolved with a broken leg. The pitching of a hospital tent in the infield and the conspicuous presence of an ambulance had not been a useless precaution

A five-mile race for stripped cars or stock chassis for a silver cup and a purse of $50 was the curtain raiser. It had for starters a promising quintette, made up of Al. Poole, Isotta; Arthur Warren, Stearns six-cylinder; Ralph De Palma, Allen-Kingston, and Al. Bellows, driving M. R. Guggenheim's Renault. The Allen-Kingston took the lead during the first mile, followed by the American and the Stearns in order. De Palma was never headed. Drawing gradually away, he finally won by a hundred yards from Elliott, who beat Warren the same distance. The fractional times of the winners were: 1 mile, 1:13; 2 miles, 2:16 2-5; 3 miles, 3:19 2-5; 4 miles, 4:23 1-5; 5 miles, 5:25 4-5; Elliott, 5:31 2-5; Warren, 5:38 2-5.

The Isotta was practically left at the post, though starting its motor and later lost its right rear tire and was stopped by Dr. J. R. Overpeck, of Philadelphia, the referee.

Then came the ten-mile race for fully equipped touring cars or runabouts manned by simon-pure amateurs under the A. A. A. rules as follows: W. B. Anderson, 50-horsepower Welch; James Doig, 30-horsepower Stearns; Thomas J. Scully, 30-horsepower Packard, and Stewart Elliott, 50-horsepower American. It was a rattling good race between Elliott and Doig with Scully in warm pursuit and Anderson in fourth place. For two miles less than a hundred feet separated the leaders. Then the big powered American drew gradually away and finally won by 300 yards in 10:53, with the Stearns second in 11:07 2-5, and the Packard third in 11:42 3-5.

Elliott's times by miles were:

1	mile	1:16	6	miles	6:35 2-5
2	"	2:20	7	"	7:38 2-5
3	"	3:24	8	"	8:43 2-5
4	"	4:27 3-5	9	"	9:47 2-5
5	"	5:31 1-5	10	"	10:53

Long-distance races were made prominent features of the card and began with the 50 miles, in which the following lined up: Al. Bellows, Renault; Harry Michener, Lozier; Arthur Warren, Stearns; C. E. Fisher, Autocar; Ralph De Palma, Allen-Kingston; Stewart Elliott, American, and W. B. Anderson, Welch. For the first nine miles there was a rattling good scrap between the American and the Allen-Kingston, with an interesting see-saw struggle also in progress between the pursuing pair, the Lozier and the Renault. Elliott held the lead for five miles and was then passed by De Palma. The American in the tenth mile was stopped by some ignition trouble and lost its place as runner up to the Allen-Kingston, which from here on was never headed, winning in 55:59 3-5, a new record for the track by 6 2-5 seconds. The Lozier was second with 47 miles, and W. B. Anderson's Welch, which was driven by C. Frewin, third, with 44 miles. The

Cars Getting into Action at the Start of the 5-mile Event.

Autocar, Renault and Stearns had been put out of the running by the accidents recited above. The intermediate times were:

Miles.	Leader.	Time.
5	Elliott	5:49
10	De Palma	11:25
15	De Palma	16:47
20	De Palma	22:00 4-5
25	De Palma	27:46
30	De Palma	33:17 1-5
35	De Palma	39:00 2-5
40	De Palma	44:41 1-5
45	De Palma	50:45
50	De Palma	55:59 3-5

Two drivers essayed to beat the mile track record of 53 seconds put up by the late Emanuel Cedrino, in the Fiat, on the occasion of bis racing début in this country in 1903. M. J. Seymour was first away in the Christie, but could do no better on such a soft track—there had been more showers—than :57 1-5. Ralpb De Palma in the Allen-Kingston scored 61 2-5 seconds.

A speedy octette of long-distance track performers faced the starter for the 100-mile race, which concluded the racing. They were: Al. Poole, 60-horsepower Isotta; Harry Michener, 45-horsepower Lozier; J. Price, 45-horsepower Acme; Stewart Elliott, 50-horsepower American; Ralph De Palma, 40-horsepower Allen-Kingston; Felix Prossen, 40-horsepower Bianchi; Ed. Von Kathergill, 50-horsepower Pope-Toledo, and I. M. Appercu, 20-40-horsepower Cadillac. The struggle that ensued was a hard-fought battle with varying leadership that kept the interest and enthusiasm of the spectators keyed

Lozier Makes Change of Tire in One Minute.

up from start to finish. It was besides a game all around exhibition of perseverence and pluck on the part of the drivers, for before the race was one-third over the rain again began to fall and made a skating rink of the course. The cars skidded badly at the turns and often swayed from side to side in the stretches. In fact, the going was so bad that there were calls to the referee to declare the race off. Dr. Overpeck, however, refused, pronouncing the course safe for long-distance racing and declaring that the contestants had a right to a run for their entrance fees.

Elliott went away in the lead and held it for ten miles, when De Palma, who had been pursuing him hotly, took it from him. The contest soon split up into a triangular duel of three pairs of cars, the Allen-Kingston and the American fighting for the lead, the Lozier and the Isotta alternating ahead of one another, and the Acme and the Bianchi having a merry scrap further back.

Around the 35th mile Poole stopped for goggles and then began chasing the flying leaders in earnest. Within five miles he had caught and passed De Palma. Elliott had dropped out in the 29th mile. The former bicycle racer, however, would not be shaken off and hung on tooth and nail. Mile after mile the pair wig-wagged in the mud by the cheering stand. Closer and closer the Yankee car crept up on the Italian machine and finally got by it in the 80th mile. Then Poole woke up and cut loose with the Isotta and caught and passed the Allen-Kingston. Both took desperate chances in the mud. But the Savannah and Briar-

Picturesque Finish by the Stearns in 10-mile.

cliff winning brand was too fleet for the Allen-Kingston, well and courageously as it was driven, and, drawing gradually away, finally won by the length of the stretch in 2 hours 10 minutes 36 4-5 seconds. The Allen-Kingston was beaten by but 12 seconds. The Lozier was third with 93 miles, the Bianchi fourth with 88 miles, Acme fifth, 82 miles, Cadillac sixth, 77 miles, Pope-Toledo, seventh, 70 miles. The score was:

Miles.	Leader.	Time.
10	Elliott	10:34 2-5
20	De Palma	23:11 2-5
30	De Palma	36:03
40	Poole	50:06
50	Poole	65:54 3-5
60	Poole	79:54
70	Poole	93:07 2-5
80	De Palma	106:03
90	Poole	118:20 2-5
100	Poole	130:26 4-5

It may be of interest to watchers of the success of the various makes of tires to note that Michelins were first and second in the 100 and first in the 50-mile race. After the races the drivers and scribes were given a clambake at Price's, Pleasure Bay.

ROCKVILLE CLUB HOLDS SUCCESSFUL CLIMB.

Rockville, Conn., July 2.—The Automobile Club of Rockville is to be congratulated on the success which attended the holding of its first hill-climb. The course measures 7-10-mile and is a stiff grade, which had been prepared by sprinkling with calcium chloride solution. Robinson in the Stevens-Duryea six and Bourgue in the Knox were the stars of the day in the large car class, while the Ford runabout took honors in its class. The Stevens-Duryea's record of :41 flat in the final was not approached, the Knox and Thomas-Detroit times of :50 and :50 1-5, respectively, made in Event 5, coming closest to it, the Knox also doing the hill in :50 flat in Event 6. In the latter, J. W. Swan in the Corbin was a good third in :50 2-5, a Stevens-Duryea taking this event in :43 1-5.

Where the Guggenheim Renault Turned Itself Over.

WILDWOOD AUTOISTS CELEBRATE THE FOURTH

WILDWOOD-BY-THE-SEA, N. J., July 6.—A battle royal between the Chadwick and the Fiat was the feature of Saturday afternoon's sprints over the famous Central avenue mile straightaway speedway, and the result proved a hard-earned victory for the foreigner, its 120 horsepower proving too much of a handicap for the 50 horsepower of the Pennsylvania designed car. Paul Schill and Willie Haupt were the drivers, and each exerted every ounce of strength and technical wisdom to land his car in the lead. Under the circumstances the result is a practical triumph for Haupt and the Chadwick, for, despite the disparity in power, each of the three trials of the latter in the official time trials was slower by but 2-5 of a second than those of his 40 per cent. more powerful rival. The Fiat's times were :45 2-5, :44 3-5 and :42 3-5, while the Chadwick's trials were made in :45 4-5, :43 4-5 and :43 2-5. The Fiat's best time not alone broke the best previous gasoline figures—Monte Robert's :44 flat—but was also two-fifths of a second under the course record of :43 flat made last Labor Day by Bert Holland in a Stanley steamer. Haupt twice succeeded in besting the 1907 gasoline record, while Schill was also able to do the trick but once. The Fiat's average for its three official time trial trips was :44 3-15, as against the Chadwick's :44 5-15. Haupt claims that he can beat :42 flat over the course, and would have done so had not some gravel found its way into his gearcase and interfered with the prompt shifting of his gears.

There was something of a mix-up in the $2,001 to $3,000 class when Frank Lescault, driver of the P. & S. car, protested all the other cars in the event for the reason that they were not equipped with fenders, as per catalogue—the program calling for catalogue equipment. After a consultation the officials refused to entertain his protest, whereupon Lescault left the course, withdrawing his car from all the other events in which it was entered and departing immediately for New York. It later developed that the P. & S. had made faster time than any of its competitors in the event, and as the prize was "up in the air," the event was run again as a special, when W. Mullen's Thomas "Forty" bested the Pennsylvania "Thirty" and the Apperson "24-30" with a mile in 1:02 flat.

Besides the Fiat-Chadwick duel, the time trials were rendered interesting by the excellent performances of the Chalmers-Detroit, which covered the course in :51 2-5; of the Apperson, driven by "Charlie" Swain, ex-president of the Quaker City Motor Club, who, despite the fact that he was the only "pure" driver in the official time trials, took his car to the wire in :52 2-5; and of the Parkin "40," a comparative newcomer, which went two trips in :55 3-5 and :53 respectively, with young "Joe" Parkin, son of the builder, at the wheel. Eddie Wilkie, with his 18-horsepower Buick, negotiated the course in 1:13 3-5, equaling the time made in the trials by the Cleveland "40." Wilkie had previously captured the under $1,250 class for gasoline with the same car in 1:28 1-5, excelling the time of the winning Mitchell in the $1,251 to $2,000 class by nearly five seconds.

Mullen and Magraw, in Thomas "40's," and W. Sprankle in a "45" Premier, battled for the honors in the $3,001 to $4,000 class; the Thomases finished one-two, Mullen winning in 1:04 2-5.

Schill and the monster Fiat easily registered in the four-cylinder over $4,000 class, with a mile in :53 1-5, "Charlie" Swain being unable to do better than 1:01 2-5, owing to a cylinder missing. Had he done as well as he did later in the time trials, :52 2-5, he would have had the satisfaction of collaring a cup from Schill. The latter also easily annexed the free-for-all, Haupt being unable to get his Chadwick to the tape owing to ignition trouble. Schill for the first time let the Fiat out, getting under the :50 mark. His time was :49 4-5, and Joe Parkin, who finished second, could do no better than :58 4-5.

The course was in excellent shape and was kept clear at all times with the assistance of the Ninth Philadelphia Boys' Brigade, under Clement M. Devine. An early morning rain, which promised to spoil the sport, had the effect of packing down the surface and laying the dust. The summary:

GASOLINE CARS, UNDER $1,250.

1.	Buick	18	Eddie Wilkie	1:28 1-5
2.	Mitchell	20	W. M. Cram	1:28 2-5

GASOLINE CARS, $1,251 TO $2,000.

9.	Cleveland	40	W. A. Wood	1:13 3-5

The carnival wound up Saturday night with the presentation of medals and prizes at the big band stand on the boardwalk. Paul Schill, besides his other prizes, was given a handsome gold medal for driving the car that lowered the course record.

Friday's reliability run from Philadelphia was marred somewhat by the combined antics of J. Pluvius and the constables at Magnolia. The former, however, acted quite decently as compared with the latter. He let up now and then; the constables never. About forty cars left the Jersey side of the Delaware for this place. At Magnolia, about six miles from the start, a pair of constables were "on the job." Each driver was asked to show his license card and certificate, and the unlucky wight who had neglected to provide himself with credentials was compelled to turn his car around and go home. In this way over a dozen cars were eliminated from the run, and their occupants were naturally furious. So were the hotel keepers here when they heard of the hold-up. But 24 cars arrived at the finish, and of these 14 were adjudged by the officials as clean-scorers. The handsome cup hung up by the Wildwood Club was drawn for and won by J. M. Hendricks, owner of a Chadwick.

After the run on Friday night all the cars were hurriedly cleaned up and, with the addition of quite a number of cars of visitors and residents, were placed on exhibition on the boardwalk. The display was very creditable both as regards number and quality, the cars extending along the esplanade for quite a distance. Attendants were stationed at most of the cars, and the novelty of a one-night outdoor automobile show was voted a huge success by the thousands of holiday visitors.

The parade on the morning of the 4th was a huge success.

Germany Triumphant in Grand Prix

HOW THE DRIVERS FINISHED IN THEIR LONG RACE ON THE DIEPPE CIRCUIT.

Pos.	Car.	Nation.	Driver.	Time. H. M. S.
1.	MERCEDES	Germany	Lautenschlager	6 55 43
2.	BENZ	Germany	Hemery	7 04 24
3.	BENZ	Germany	Hanriot	7 05 13
4.	BAYARD-CLEMENT	France	Rigal	7 30 36

23.	PANHARD	France	Farman	9 24 40

DIEPPE, July 6.—All the high honors in the Grand Prix, which was run over the Dieppe course to-day, fell to Germany. Her triumph was as complete as was ever attained by a nation in this classic international contest. Her cars finished one, two, three. It was a bitter day for French and Italian makers, who in the past years have pretty well monopolized Grand Prix honors. Frenchmen, however, were at the wheels of the second and third cars.

Lautenschlager, driving a Mercedes, won. He covered the 478.1-mile course in 6 h. 55 m. 43 s., an average of 111.5 kilometers, or 69.24 miles per hour.

Hemery, a Frenchman, and former Vanderbilt Cup winner, was second in a Benz, a German car, in 7 h. 4 m. 24 s.

Hanriot, another Frenchman, also driving a Benz, was third, in 7 h. 5 m. and 13 s., less than a minute behind Hemery.

Louis Strang, before the start, drove up to the enclosure with the transmission and reversing gear of the Thomas, the only American car competing, so jammed as to kill all chance this stock car had before the race was even started. Strang and his mechanic managed to mend matters a bit, but was forced to start with the first and second speed and the reversing gear out of commission. Despite this, he completed the first round of 47.8 miles in 53 m. 44 s., and, after more repairs, resumed the race. He made the second lap in 63:43, the third in 56:47, and the fourth in 58:01. This was as far as he got. He said he had tire troubles every round, and that finally one cylinder was put entirely out of commission.

The killing of two men was the one cloud on the success of the race. As Cissac was on the final round with a Panhard, a tire was torn off, resulting in the car upsetting and crushing to death its driver and his mechanic, Schaub.

Another serious accident was the upsetting of a Weigel in rounding a turn near Eu. Harrison, its driver, was thrown out and carried to a hospital tent, badly injured.

A feature of the race was the pluck displayed by Hemery in continuing the contest after a flying stone had driven a piece of glass from his goggles into his eye. The game Frenchman drove up to the stand, stopped only long enough for a physician to inject cocaine in the injured member, and then went on without losing his place as runner up.

The pace at the start was very fast. Salzer, driving a Mercedes, made the first round in 36 m. 31 s., or at the rate of 126.5 kilometers an hour. This was the fastest lap in the race, and beat the 38 m. 16 s. made my Nazarro last year. In fact, six drivers beat the Fiat crack's record in the first round. The winner's time at the end, however, was 9 minutes slower than Nazzaro's winning time in 1907.

Lautenschlager took the lead in the seventh round by steady driving, and after that was never headed. After five rounds had been completed, the three German cars had attained the positions in which they finally finished. After the Mercedes champion had wrested the lead from Nazarro, the Fiat crack dropped back into the ruck. His downfall was due to a jammed clutch. Nazarro had fought his way to the fore in the second round.

The French fought fiercely to avoid defeat. Szisz, the Renault crack, fell back, and then Duray, the blonde Lorraine pilot, dropped behind. This left the brunt of the fight to Théry, the champion of the Gordon-Bennett days. He, too, was finally passed in the fourth round by his compatriots, Hemery and Hanriot, at the wheels of German cars. Tire trouble was at the bottom of his fall.

The Frenchmen, though bitterly disappointed at the outcome, took their medicine with admirable sportsmanship. Lautenschlager was loudly cheered as he was escorted to the presidential box, where he was congratulated by M. Maujan, minister of the interior, while the band played "Wacht am Rhein." Baron von Zuylen, president of the Automobile Club of France, telegraphed Emperor William, announcing the success of the German cars.

The result of the race was a repetition of the Michelin success of the voiturette race the day before, the entire trio of German cars, which finished in the lead, being equipped with Michelin tires.

A. A. A. DELEGATES ARE DENIED ADMISSION AT DIEPPE

ACCORDING to press cables, the allied European clubs, which met at Dieppe on Monday, denied the national body of the United States admission, a personal hearing and voted to recognize the Automobile Club of America as their sole representative in this country. William K. Vanderbilt, Jr., and A. G. Batchelder, the accredited representatives of the American Automobile Association, were not allowed to be present. Count Sierstopff, president of the German Automobile Club, is reported to have made a statement on their behalf setting forth as best he could from hearsay the conditions existing in this country. There was no opportunity afforded Messrs. Vanderbilt and Batchelder to reply to any statements Dave Hennen Morris, George Heath, and W. S. Hogan, the club delegates, might make.

Count Sierstopff is said to have pointed out that the A. A. A. was the larger and more powerful organization and that the Vanderbilt commission had never been notified of any agreement made by its correspondents in the matter of the Ostend rules. As a matter of fact, the New York club's foreign representatives, then acting as A. A. A. correspondents, never attended the Ostend meeting and so could not have bound the A. A. A. to the revised rules had they had any such authority.

The shutting out of the A. A. A. delegates and the refusal to grant the national body in the United States a hearing was the outcome of a protest filed by the national clubs of Great Britain and Germany prior to the meeting.

The cables say the discussion was a warm one and resulted in the recognition of the New York club as the only organization in this country that could hold membership in the International Association of Recognized Automobile Clubs. The position taken was that only one organization could be recognized in any one country and that the choice should fall on the one that had incorporated the Ostend conditions in its rules.

A clever grandstand play was made by the New York club in Judge Gary securing from President Roosevelt, our nation's good-natured chief, a message of good will for transmission to Baron Zuylen von Neyvelt, the president of the association. The color this message lent to the pretensions of the New York club to being a national body can well be imagined.

The outcome will draw the line between the A. A. A.'s contest and the New York club's races still more sharply. The Vanderbilt will have its Americanism intensified and the Savannah will be more than ever emphasized as a special event kindly promoted in this country for European cars under European rules by their very good friends of the New York club.

FRENCH VOITURETTES ARE VICTORIOUS.

DIEPPE, July 6.—France prevailed signally in the race to-day for voiturettes over the Dieppe course, which scored as a curtain raiser to the Grand Prix of to-morrow. The first five cars to finish were of French make.

A double cylinder Delage, driven by Guyot, won, his time being 5 h. 45 m. 30 s., an average of 50 1-3 miles per hour. A single cylinder Sizaire et Naudin, piloted by M. Naudin, was second in 5 h. 52 m. 6 s. Leon-Peugeot single-cylinder cars, driven respectively by Goux and Dugernoy, finished third and fourth, the first being four minutes behind Naudin. Thomas, driving a Delage, captured fifth place. All were fitted with Michelin tires.

There were 62 entries and 47 starters, of whom 32 finished, including 8 complete teams. There were 40 French, 3 Italian, and 3 Swiss cars in the race.

The attendance was conspicuously small at the start—less than one thousand were seated on the monster grandstand. The course was in bad shape and was further cut up by the racers, so that to-morrow's Grand Prix contestants will probably have rough going with the likelihood of much tire trouble.

There were a few accidents, none, however, of a serious character. A Truffault, driven by DeMeester, struck a bridge at Eu. A Guillenim, piloted by Bordes, overturned at Maux. Anaries, with St. Marc in the seat, broke a wheel. None of the drivers were badly injured in any of the spills.

ZEPPELIN AIRSHIP PROVES DISAPPOINTING.

FRIEDRICHSHAFEN, GERMANY, June 30.—Count Zeppelin's monster airship has sorely disappointed its backers. After considerable delay, caused by mechanical defects discovered at the last moment, the airship made preliminary flights over Lake Constance, but altogether failed to live up to expectations.

The driving fans, operated by two 126-horsepower motors, appeared to be no larger than those of the earlier No. 3, and were manifestly unable to drive the balloon at anything like the speed required. There was also a lack of buoyancy.

It is declared on good authority that the German Government officials who have been backing Count Zeppelin are bitterly disappointed at the failure of the airship, and that as the result of non-success support is likely to be withdrawn.

OVAL TRACK FOR WINNIPEG.

WINNIPEG, MAN., July 2.—A movement is afoot to construct a 158-mile road for automobilists near Winnipeg. It will be oval in form, and the expense of the construction and maintenance will be met from the tolls collected from those who use it. It is proposed to run some big races on the road, which will be oiled to keep down the dust. Eastern Canada has already taken kindly to oiled roads. This is demontrated in Montreal, where the practice of oiling the roads is being freely adopted.

RACES AT FAMOUS PIMLICO TRACK WERE EXCITING

BALTIMORE, July 6.—Robert Morton, who drove the 40-horsepower Pullman car entered by the York Motor Car Company, of York, Pa., was the real hero in the third automobile races held at Pimlico, on the Fourth of July, under the auspices of the Motor Car Racing Association of Maryland. Of the four events in which this Pullman car was entered, Morton captured three firsts and was third in the other. He defeated E. L. Leinbach, the "Daring Dutchman," in the five-mile stock touring event, his time in this race being 6:06. Leinbach drove in this event a 35-horsepower Moon car, entered by William C. Blome, of Baltimore. Morton was also first in the ten-mile free-for-all handicap and in the 50-mile championship, open to stripped stock chassis of 45-horsepower or less.

Morton in Pullman Winning 10-mile Handicap.

Leinbach was a close second in the distribution of honors. With his 60-horsepower Stearns car, he won the ten-mile Maryland runabout championship, for stock touring runabouts or tourabouts, and was third in the ten-mile handicap, the only two events in which this car was entered. He only lost the handicap race to Morton and Roy Stains, who also drove a Pullman car, of 30-horsepower, because of the handicap he gave these cars. Morton had 35 seconds and Stains 50 seconds. Morton's time, including the handicap, was 10:36, while Stains's time was 10:47. Leinbach made the distance in 10:52 from scratch. This race was the center of interest and while Leinbach crossed the line third he made the best time. One of his miles was made in 1:03 3-5, while his average for the ten miles was 1:05 1-5.

The 50-mile championship proved a dual event—two races in one. The two Pullman cars, driven by Morton and Stains, were neck and neck in the lead until Stains's car, near the approach of the 28th mile, went wrong. In the meantime the two Autocars, driven by John Archfield and J. F. Brown, had an interesting race all to themselves further back. Morton won the event and Archfield came second, with A. W. Behrens, in a 28-horsepower Maryland car, third.

The opening event, a five-mile race for baby runabouts, was won by Robert F. Kaehler, in a 15-horsepower Ford. The only accident occurred in the motorcycle event when Chic Thomas went through the fence. W. E. Mangold won this event.

The crowd was disappointed by the non-appearance of the entries of Louis J. Bergdoll, of Philadelphia, the millionaire driver, who was scheduled to meet Leinbach in a 25-mile match race. The failure of the cars to be at the track will result in Starter Wagner reporting them to the racing board, which may result in suspension. The cars of J. L. B. Wilhide, of Baltimore, and Thomas and Tolman of Washington, will also be reported.

Starter Wagner would not allow the 40-horsepower Thomas, entered by Wallace Hood, of Washington, to start in the Maryland runabout championship because of an extra tank being on the car. Hood was also entered in the 50-mile race, but had trouble with his cylinder, which he could not put in shape.

H. M. Rowe was referee. The judges were Osborne I. Yellott, W. S. Belding and James S. Reese; starter and clerk of the course, Fred J. Wagner; assistant starter, Edgar F. Dobson; announcer, Howard A. French; scorers, E. C. Briggeman, L. W. Tremblay and R. Milton Norris; timers, C. Howard Millikin, Harry F. Fisher and C. Ross Klosterman. The summaries:

FIVE MILES—BABY RUNABOUT CLASS; OPEN TO RUNABOUTS COSTING $1,250 AND UNDER.

1.	Ford	15	R. F. Kaehler		6:59
2.	Cameron	16	Jefferson Davis		7:13
3.	Overland	20	Geo. E. Norwood		....

TEN MILES—MARYLAND RUNABOUT CHAMPIONSHIP; OPEN TO STOCK TOURING RUNABOUTS OR TOURABOUTS.

1.	Stearns	60	E. L. Leinbach		11:04 2-5
2.	Pullman	30	Roy Stains		11:33
3.	Pullman	40	Robert Morton		11:39
4.	Autocar	30	J. F. Brown		.....
5.	Autocar	30	E. H. Freas		.....
6.	Autocar	40	Chester Smith		.....

FIVE MILES—OPEN TO STOCK TOURING CARS OF 24.1 TO 40-HORSEPOWER, INCLUSIVE.

1.	Pullman	40	Robert Morton		6:06
2.	Moon	35	E. L. Leinbach		6:56 3-5

TEN MILES—PIMLICO FREE-FOR-ALL HANDICAP

1.	Pullman	40	Robert Morton		27:08
2.	Pullman	30	Roy Stains	(60)	10:47
3.	Stearns	60	E. L. Leinbach (Scratch)		10:52
			Also Started.		
	Maryland	28	A. Behrens	(1:10)	.....
	Jackson	40	C. Smith	(:55)	.....
	Autocar	30	E. H. Freas	(:55)	.....
	Autocar	30	J. E. Brown	(:50)	.....
	Thomas	40	W. C. Hood	(:10)	.....

FIVE-MILE MOTORCYCLE CHAMPIONSHIP PISTON DISPLACEMENT HANDICAP.

1.	Indian	3 1-2	M. E. Mangold	(20)	5:49
2.	Indian	3 1-2	Chic Thomas	(20)	5:55
3.	Indian	3 1-2	W. S. Fisher	(30)	.....

FIFTY-MILE CHAMPIONSHIP—OPEN TO STRIPPED STOCK CARS OR STOCK CHASSIS OF 45-H.P. AND UNDER.

1.	Pullman	40	Robert Morton		57:08
2.	Autocar	30	John Archfield		62:22
3.	Maryland	28	A. W. Behrens		66:18
4.	Autocar	30	J. F. Brown		66:47
5.	Pullman	30	Roy Stains		.....

Start of Runabout Championship That Stearns Won.

TIME OF WINNER BY MILES.

Miles.	Time.
5	5:47

35	39:17
40	45:07
45	51:02
50	57:08

F. A. M. MEET BRINGS OUT NEW MILE RECORD

NEW YORK, July 6.—For the past three days the Federation of American Motorcyclists has had possession of the town. Friday, July 3, was set as the day for the opening of the annual reunion, which took the form of a business meeting and election held at Terrace Garden. The officers who will serve for the ensuing year are: president, Earle L. Ovington, New York; vice-president, eastern district, E. L. Buffington, Providence, R. I.; vice-president, southern district, E. Y. White, San Antonio, Tex.; vice-president, western district, John R. Ball, Milwaukee; vice-president, Pacific Coast district, R. K. Holmes, Los Angeles, Cal.; treasurer, E. B. Gibson, Westboro, Mass.; secretary, H. J. Wehman, New York.

On the following day, the members and their friends, several thousand strong, gathered at the new Clifton Stadium in Paterson, N. J., for the annual race meet which proved to be a highly exciting event. The star performer of the day was J. H. DeRosier, of Springfield, Mass., who lowered the world's motorcycle mile track record of :56 2-5 seconds, made by C. Hoyt of Cambridge, Mass., in 1905, to :56 flat. DeRosier, mounted on a 5-horsepower, twin-cylinder Indian machine, made his first appearance in the 10-mile race for professionals, limited to machines not exceeding 61 cubic inches piston displacement. He got away easily and led the bunch for the entire distance, his machine making lap after lap of the steep-banked track with that steady purr that indicates perfection of running. He made the distance in 11 minutes, 59 seconds, J. King of Newark, N. J., coming in second shortly after.

The next event on the program was DeRosier's mile exhibition against time, and was made from a flying start. His terrific speed of considerably better than a mile a minute was appalling on the small saucer-like track, which has six laps to the mile, the impression received by the spectators being that of a flying human ball from which flames and smoke leaped in a steady stream, as the motor was kept opened to such an extent, even on the curves, that the exhaust was nothing but an uninterrupted roar right from the start to the finish.

The comparison made by the next event on the program, which was a half-mile race for tricycles, brought a laugh from the spectators, owing to their snail-like pace. The best time was made by F. W. Jones of Passaic, who led Oscar Goerke of Brooklyn, over the tape by a tire in :57 4-5. In the five-mile pursuit race limited to machines not exceeding 61 cubic inches piston displacement, Charles Davidson, of Springfield, Mass., on a 5-horsepower Indian, overtook Fred Huyck, of Chicago, at the two-mile mark. Preliminary heats in the three-mile pursuit race were cut to a mile, and the two left to contest in the final three-mile trial were Walter Goerke, of Brooklyn, and Charles Gustaveson, of Springfield, Mass. Goerke caught his opponent at exactly the three-mile mark, his time for the distance being 3 minutes, 17 seconds. This event was limited to machines not exceeding 30.50 cubic inches piston displacement. There were two or three bicycle races on the program as well.

The closing event of the annual meet took the form of an 1,100-mile tour from New York to Chicago, 20 contestants leaving the Hotel Empire at Sixty-third street and Broadway Monday morning last. Between six and seven o'clock the same evening, 16 of them had checked in at the Ten Eyck, at Albany, 153 miles, to I. F. Alofsin, who is the tourmaster. The remainder were stretched along the road between Poughkepsie and Albany, their delays being chiefly due to tire troubles. Tuesday's installment consisted of a run of 98 miles to Utica, N. Y., the difference in the distance of the two days being accounted for by the fact that part of the day's run will consist of a hill-climb at Tribes' Hill. This is between Amsterdam and Fonda and is believed to be the worst rise on the entire run to Chicago. Chairman Alofsin has charge of the climb, assisted by E. A. Githens and P. S. Harte. All the riders who arrived at Albany the night before in time to check in got to the hill in good season, with the exception of De Salvo on an Armac, who was penalized 3 1-2 points for being late at Amsterdam. He was also unfortunate on the hill, as he was compelled to dismount about half way up, and in this manner lost another 5 points. With this single exception the much dreaded hill proved to be a tame affair, every one of the machines getting up it without the slightest hitch. Nor have any of the others suffered from road penalizations, although the going has not been quite as good as the first day. The difference in the distance may account for this, and doubtless some of the riders will meet with misfortunes between Utica and Buffalo. Since it was last reported at Poughkeepsie at 5:30 P. M. Monday, the light team of three machines has not been heard of, and it seems quite probable they were unable to continue further, owing to an accident of some kind.

One of the features of the first day's run to Albany was the welcome of the Hudson Valley Automobile Club, at Poughkeepsie, who warned the motorcyclists of speed traps and torn-up roads between that city and Hudson and set them on the right way, furnishing complete directions for finding the good state roads in Dutchess and Columbia counties. The run was marked by but one accident, which happened to Arthur Lyon, of Chicago, who killed a dog while coming up Green street, Albany. Lyon got a severe jolt but was not thrown from his seat or injured in any way. The roads and weather have been ideal and reports received from points further west indicate that favorable conditions are to be looked for as far as Buffalo at any rate. The riders, or at least those of them who manage to survive the gruelling test, expect to arrive in Chicago July 16.

Some of the Huge Crowd That Gathered at Clifton.

Start of One of the Motorcycle Teams for Chicago.

THE STORAGE BATTERY IN AUTOMOBILE WORK

By BRUCE FORD, Member Society of Automobile Engineers.

THE history of the storage battery dates from the year 1860, when a Frenchman named Gaston Planté immersed two pieces of sheet lead in dilute sulphuric acid without touching each other and passed a current from an external source through them; one of these plates became oxidized, and upon reversal of the current the oxidized plate became reduced and the other plate became oxidized. He discovered that upon breaking the circuit the lead plates had become charged and would act like a primary battery in giving current, the oxidized plate being the positive and the reduced plate the negative pole. He further discovered that by reversing the current several times the capacity of the cell was considerably increased by reason of the fact that the layer of oxide would become thicker upon each reversal, and that this oxide becoming reduced would give a layer of spongy lead, thereby increasing the capacity of both the positive and the negative plate. In 1880 another Frenchman named Camille Faure and an American named Charles F. Brush, almost simultaneously brought out plates in which the chemical actions employed were the same, but instead of forming the layer of oxide from the metallic body of the plates by the reversals of current, the oxide was mechanically applied to frames of lead or lead alloy. By this process the same, or greater capacity, could be obtained from plates of less weight.

Plates of the former type, although very much modified in design over those of Planté, are to-day extensively used in stationary work, and to some extent in portable work. They are also used to a very limited extent in automobile work; but the plate almost universally used in this class of service is of the Faure or Brush type, and this paper will be devoted to this type alone. The earliest commercial application of the storage battery for automobile propulsion was made with the chloride accumulator, a battery of modified Planté type, and in 1899 its makers, foreseeing the need of a lighter and more compact type of battery, started to develop one of the Faure or Brush type. The result was the battery since known as the "Exide." The makers have kept in close touch with the requirements of service, and not only have the positive and the negative plates been modified from time to time, but the jars and accessories and methods of mounting and connecting the cells have been improved just as the vehicle itself has been improved, as the requirements have become better understood.

The storage battery finds itself used in various ways in an automobile. In the electric machine it is the entire source of the energy used for propulsion. In the gasoline-driven machine it makes a convenient and reliable source of ignition. These two form by far the largest uses, although, in the case of the combination gasoline-electric machine the storage battery is useful as a reservoir of power to be called upon in emergency conditions, enabling the power plant to be of size more in proportion to the average rather than to the maximum demand. In this system the storage battery is also very useful in starting the engine. The storage battery is also used to some extent for lighting automobiles, and in some cases the ignition battery of a gasoline machine is made of specially high capacity, so that it can be used for front and rear lights in addition to its function of furnishing current for the spark.

Batteries for Pleasure and Business Service.

As used for propulsion, the battery can be divided into two classes: those used for pleasure vehicles, and those used for commercial delivery wagons and trucks. The type of battery is, in general, the same. In commercial service, however, the batteries run to much larger sizes and, in consequence of this as well as the less resilient spring and tire action, they are of necessity assembled in a more heavy and substantial manner. Propulsion batteries consist of the following elementary parts: positive plates, negative plates, separators, straps, jars, covers, connectors and crates for containing the assembly of cells.

The Exide plate consists of a grid of special elastic lead alloy filled with a paste of lead oxide. In design the positive and negative plates are similar, the positive grid, however, being thicker and heavier than that for the negative plate. The standard grids are 7-32 inch and 3-16 inch thick respectively. The grid consists of a frame around the outside of the plate, having vertical bars throughout the body of the plate spaced about 3-4 inch apart and which extend from its top to its bottom edge. There are horizontal rods of very small cross section flush with the surface of the grid and spaced about 1-4 inch apart on each side of the plate; the rods on one face of the plate are not placed opposite those on the other face but midway between them, or in staggered relation. It is thus seen that the body of the grid contains open spaces about 3-4 inch wide, which extend from the top frame to the bottom frame and are enclosed by the horizontal facial rods; these open spaces are filled with the lead oxide paste, which, when in position, sets like cement in the form of a pencil about 3-4 inch wide, held in its position between the vertical bars and between the facial horizontal rods. The plates, after being pasted and the paste allowed to set, are given an electro-chemical formation, during which the paste or active material of the thicker plates becomes peroxidized, making them positive plates, while the active material of the thinner plates becomes reduced to porous, spongy metallic lead, making them negative plates. Each grid is supplied with a projection or lug at or near one of its upper corners.

The plates are made of different sizes, but the two sizes most used are the *MV*, 8 5-8 inches high by 5 3-4 inches wide, and the *PV*, 8 5-8 inches high by 4 3-4 inches wide. The *MV* is rated at seven ampères per positive plate for four hours, and the *PV* at six ampères for four hours; a sufficient number of plates is assembled in each cell to give the required capacity, and a sufficient number of cells are connected in series to give the required voltage. Each cell consists of a rubber jar, an element and electrolyte. The rubber jar consists of a deep rectangular box of hard rubber, with walls 1-8 inch thick, more or less, according to the size and service. In the bottom of the jar, and made integral with it, are bridges or ribs of height consistent with the service and whose function it is to support the weight of the element and to provide space into which is deposited the sediment thrown off by the plates with wear.

Construction of the Elements.

The element consists of positive and negative plates burned to straps and kept apart by separators interposed between the positive and negative plates. In assembling an element, a negative plate is laid down with a separator on it, then a positive plate, separator, negative plate, and so on. The plates are so placed that all the lugs of the positive plates are on one side and all the lugs of the negative plates are on the other side. A strap, consisting of a flat strip of lead or lead alloy having rectangular openings in it of the same dimensions as the cross-section of the lug of the plates, these openings being spaced to register with the lugs, is then placed over the plate lugs of the positive plates, and a similar strap is placed over the lugs of the negative plates. The lugs are then burned into integral union with the straps. In pleasure vehicle service it is customary to make the plate lugs comparatively short, so that the straps are somewhat below the top of the jar, and a cover consisting of a rectangular piece of hard rubber is placed on top of the straps which are furnished with projections extending through holes in the cover and by which the cells are connected by burned joints. In commercial service the batteries are usually assembled with top straps, and the plate lugs extend above the top of the jar, the strap having

two rows of holes in it, one row being placed over the corresponding row of plate lugs of one cell, and the other row of holes being placed over the plate lugs of opposite polarity in the adjoining cell, and the cell is completed by burning the lugs to the straps, which, in this case, themselves make the connection from cell to cell.

Wood Separators Are Most Efficient.

The separator, which has proved by experience to be the most successful, consists of a piece of wood veneer with parallel grooves about 1-4-inch wide, spaced close together and plowed out of one side, the plain sides being placed directly against the face of the negative plates. A thin sheet of perforated hard rubber is placed against the grooved side of the wood and rests against the face of the positive plate; this perforated rubber performs a double function, in that it protects the wood from the oxidizing action of the positive active material and also tends to restrain the wearing action of the wash of the acid on the active material of the positive plate. The grooves of the wood separator are arranged vertically, and there is thus a number of free channels for circulation of the acid and for the escaping gases liberated during the action of the battery, especially toward the completion of charge. The wood of which the separators are made is given a chemical treatment to remove substances contained in natural wood which would otherwise do great damage to the plates; this is of the greatest importance, as the success of the wood separator depends upon the proper method of treatment, and the thoroughness with which the treatment is applied. An improperly treated wood separator is a menace to the life of the plates.

The cells are filled with electrolyte, which consists of a mixture of pure sulphuric acid and pure water, with a specific gravity of about 1.210. After the battery is fully charged the specific gravity reads about 1.280; the reason for this rise in gravity is that the negative plates before leaving the factory are given a slight sulphating treatment to prevent their oxidation; in giving the battery its initial charge the sulphate is reduced to spongy metallic lead, giving sulphuric acid to the electrolyte, which raises its gravity.

In pleasure vehicle service it is customary to enclose the cells with a tight-fitting rubber cover resting on the plate straps slightly below the top of the jar, and to seal the joints with sealing compound, placing a rubber plug in a hole in the center of the cover for filling cells with water to replace evaporation, the plug being supplied with a small hole for the escape of gases. In commercial service, covers are often dispensed with altogether, as the batteries are usually in service a greater proportion of the time and require filling and inspection much oftener. Where covers are used to prevent splashing, they usually rest on special supports and are seldom sealed. From 40 to 42 is the largest number of cells that it is customary to use, as more than this number cannot be charged in series from a 110-volt lighting circuit, and, without special and inconvenient apparatus, it is bad practice to charge batteries in parallel. In the smaller equipments, where the use of 40 or 42 cells would necessitate cells of very small size, it is common practice to use fewer cells of a larger size in spite of the fact that in charging some of the voltage may be wasted through resistance.

Factors Influencing Battery's Life.

The durability of a battery not only depends upon pure materials and uniformity of methods in manufacture, but also upon the care which it receives in operation. A battery could be ruined in half a dozen discharges by sufficient abuse, whereas, with good treatment the same battery might have run for several hundred discharges. The manufacturers, realizing the importance of this fact, have expended a great deal of time and money in trying to impress upon the users the importance of following a few simple rules; and the instruction books, which are carefully revised and brought up to date from time to time, are worked out with a view to bringing out clearly the necessity for following the rules laid down. One of these instruction books is now in its fifteenth edition. A battery is not like a steam engine or dynamo, which, if neglected, will squeal or groan and refuse to work. There are, however, just as clear evidences of trouble or neglect in the storage battery, if looked for, as there are in an engine or dynamo being run without oil. Voltmeters and hydrometers used in an intelligent manner can be used to determine a battery's condition with remarkable accuracy if properly understood.

The life of a battery with pasted plates is normally limited by life of the active material of the positive plates, which with each charge and discharge become more soft and loose at the surface, gradually washing out. As this washing out depends chiefly upon the number of charges, and, within usual limits, is practically independent of the strength or duration of the discharge current, it may be readily seen that statements of life expressed in time, or total mileage, are apt to be misleading.

Four-hour Capacity Is Standard Rating.

Present practice is to rate batteries on the basis of their 4-hour capacity; for instance, a 9-*PV* cell is rated at 24 ampères for 4 hours, the 11-*MV* cell is rated at 35 ampères for 4 hours. The reason for this is that present practice is to so construct the vehicles that at the average current consumption the vehicle will run for about four hours. Some years ago it was the practice to rate vehicle cells on the basis of their 3-hour capacity. This, however, was when a heavier type of cell was used and the requirements for mileage per discharge were not as great. If a battery will give 40 ampères for 4 hours, or 160 ampère hours, it will not give 160 ampères for one hour; and if discharged at 20 ampères it will give more than 8 hours, or more than 160 ampère hours. This is one reason why greater mileage can be obtained on a charge when the vehicle is run at low speed, although, of course, other factors, such as wind resistance, etc., play their part. Exide batteries with proper use will increase up to from fifteen to twenty-five per cent. more than their rated capacity.

Demands are made from time to time for a battery having a greater capacity for unit of weight. It is an axiom in storage battery work that greater capacity for unit of weight means decreased durability. The simplest way to increase capacity with the same weight is to fill the plates with a more porous paste. This results in a paste which, with use, becomes softened up and washes out more rapidly, and is not considered good practice. The preferable method is to make the plates thinner and put more of them in each cell. A plate of one-half the thickness will not have the same capacity as a plate of standard thickness, but it will have more than half the capacity. This fact, together with the fact of there being more plates per cell, and therefore, at the same current per cell the rate of discharge per plate is lower, makes an appreciably higher ampère-hour capacity per unit of weight. Cells have been made in which the positive plates are 3-16 inch thick and the negative plates 5-32 inch. By placing eleven of these plates in a jar designed for nine standard plates, the weight is increased about 2 per cent., while the capacity is increased about 20 per cent. The life, expressed in number of discharges, is naturally less in the special thin plate combination. If, however, the full capacity is taken out on each discharge, the life in ampère hours, or, in other words, the mileage obtained, would be about the same as with standard plates fully discharged each time.

Light Weight Is Not the Only Factor.

The aim in the design of the Exide cell is to produce the greatest watt output per pound at the 4-hour rate of discharge, consistent with durability. The straps and plate lugs are not only designed with reference to mechanical strength, but also are made of cross-section consistent with drop in voltage, to give the maximum watts per pound at the cell terminals. In the vehicle battery this is a most important feature. There are many cases where the vehicle manufacturers could give advantageous consideration to the drop in conductors. An Exide cell discharging at its 4-hour rate is giving, roughly, two watts per

pound of cell. In ordinary cases the most economical size of wire to use for the conductors would be that which would give a loss per pound nearly equivalent to the output per pound of battery; or a conductor loss of about two watts per pound of wire, since the number of watts per pound should be a maximum at the motor terminals and not only at the battery terminals.

Ignition Accumulators an Important Branch.

There are probably many cases where the addition of a pound to the wire or to the controller contacts would save three watts or more at the motor terminals. It would seem that aluminum is a metal particularly well suited for wiring electric vehicles, since its weight for the same conductivity is much less than that of copper. By using aluminum conductors it would, therefore, be possible to reduce the weight and also to reduce the total loss in conductors both together. Its cost for the same conductivity is about the same, or even a trifle less, than the cost of copper. I have, however, never heard of aluminum being used for this purpose in this class of work.

Storage batteries for the ignition of automobile gas engines have become quite an important development of the storage battery business. For this class of service it is not only necessary to have substantial and durable plates and fittings, but it is necessary that all the parts should be mounted in a compact and durable manner. Batteries for this class of work, at the present time at least, must be built for abuse. They are frequently discharged until practically exhausted, and they are allowed to stand in this condition. No battery worked in this manner can give the best results, and it is economy to take care of the batteries in this class of service just as it is economy to take care of them in other classes of service. The discharges, however, extend over long periods of time and, even when abused, after the battery has given comparatively few discharges it has had a considerable life, measured in time. The Exide battery for this purpose consists usually of three cells, each element composed of plates, usually 5 inches high and 4 3-4 inches wide, mounted in a rubber jar with wood separators, and having posts extending through the cover of the jar. The inter-cell connections are burned and the posts are extended and terminate in a bolt and nut connection for the ignition. The bolts were formerly made integral with the posts, but owing to the possibility of their being twisted off or stripped they are now made separate and can be easily replaced if broken or damaged. The cells are mounted in a substantial box and are made integral with the box by pouring compound between the jars and the sides, and flooding the compound level with the top of the box, which is somewhat above the top of the jars and inter-cell connectors. Tubes placed in the covers extend through this compound and are closed by a removable vent cap, which gives access to the cells for filling with water to replace evaporation. It is good practice to charge these batteries at regular intervals whether they are being used much or not.

Simple Rules to Be Observed.

In general, the observance of a few simple rules is all that is necessary to get the best results from any kind of lead storage battery. The principal rules to be followed are:

(1) Keep the level of electrolyte above the top of the plates.

(2) Never replace evaporation with anything but pure water; the use of dilute acid for this purpose causes much harm, and should never be resorted to until it is known that the specific gravity of the acid cannot be brought up to its proper value by continued charging.

(3) Do not make a practice of charging batteries when only a small percentage of their capacity has been taken out, except, as above noted in ignition service, where the length of time necessary to take out a larger percentage might be too long.

(4) Do not allow the batteries to remain an unnecessary moment in a discharged condition, and at intervals see that the battery is charged to its maximum.

AUTOMOBILES AS AN AID TO AMERICAN RAILWAY SERVICE

PHILADELPHIA, July 6.—The Pennsylvania Railroad Company, as an experiment, introduced the use of automobiles to expedite the handling of freight between stations in large cities. Such a service has been started between Kensington and Shackamaxon stations in Philadelphia, and if that is a success it is planned to try the same experiment in other large terminal cities, such as Pittsburgh and Baltimore. The automobile truck which the Pennsylvania Railroad is using in Philadelphia has saved between six and twelve hours in the handling of package freight between the stations named. This freight automobile has a capacity of five tons and is driven by a six-horsepower electric motor. It averages about seven and one-half trips a day, carrying 2.2 tons per trip, its daily mileage averaging about eight miles.

Previous to the introduction of the automobile in the Kensington district, small lots of freight were sent from station to station in cars. With the automobile service congestion is relieved and the movement of freight by a direct route instead of a circuitous one saves both time in delivery and the use of freight cars. The Pennsylvania Railroad is also bringing the automobile into use in its passenger service. In Jersey City an innovation is the introduction of large automobile trucks in the baggage service. These trucks are about the size of a three-horse wagon and are so built that when being loaded the floor of a truck is on a level with and flush against that of a baggage car.

Many hard knocks are in this way saved to every trunk handled in this way through the Jersey City station. In moving a trunk from the car to the truck it receives about the same handling it would get in being shifted about inside the same car. This is but one of the trunk protective features of the trucks. Another is that they are enclosed entirely with a wire grating and leather top, preventing any scraping or falling in the trip across the river.

The service to which the new trucks are being put entails through trips between the baggage cars and the Twenty-third street station in New York. They are loaded to their full capacity and are raised and lowered between the ferry level on elevators. The electric power does away with the manual labor formerly necessary to push loaded trucks up the heavy grades at the approach to the ferries at certain stages of the tide. The truck is about fifteen feet long and five feet wide, with a seat in front for the driver. Its height, of about nine feet, is necessary, that the floor of the truck may meet the baggage car floor on a level.

Not only in Jersey City is the automobile being used in the passenger service. In Broad street station, Philadelphia, there are in use automobile trucks for baggage and mail. These, however, are about the size of an ordinary hand truck, and very similar in appearance. The electric mechanism is placed under the body of the truck and is operated from the handle or "tongue."

So satisfactory have these automobiles proved in the baggage and mail service that there are now being built a number of small electric trucks for use in the new terminal station in Washington. These will be similar to the trucks now used in Broad street station, though they will embody improvements which are expected to overcome the slight difficulties which have been experienced with the first automobile trucks that were placed in service.

ALCOHOL VERSUS GASOLINE AS FUEL FOR AUTOMOBILES

IN reply to inquiries from the United States, Consul-General Robert P. Skinner, of Marseilles, furnishes the following information relative to the status of alcohol and gasoline as power producers in France and the efforts which bave been made toward the general use of the former:

Real and rapid progress has been made in overcoming past objections to the use of alcohol, and when thc price of denatured alcohol is somewhat lower than the price of gasoline, it can be substituted for the latter, both for automobiling and general purposes. Former reports showed that tbe high cost of alcohol, excessive consumption, and the resulting oxidation of mechanical parts had not been counterbalanced by any discoverable advantages. How seriously these problems have been attacked may be judged from the expression of an informant—perhaps the most important French manufacturer of carbureters.

We estem the questlon of the lndustrial use of the alcohol motor as definltely resolved, and the carbureters created ln vlew of tbls utlllzatlon have given satlsfactory results. The use of alcohol will become more advantageous when an understandlng ls brought about between the producers, whereby prices shall obtaln some fixlty, and when the State shall have solved the questlon of the denaturlng agent.

If ingenuity has mastered the material difficulties in the way of substituting alcohol for gasoline, commercially the problem is almost as insolvable as ever; and if it is insolvable in France, where gasoline is dear and alcohol relatively cheap, it must be still more so in the United States, where gasoline is cheap and alcohol is dear. Nevertheless, with raw material available for the manufacture of alcohol in every country under the sun, and with very few gasoline producing centers, it is hardly venturing too much to assume that ere many years there will be a permanent and general use of alcohol as a source of motive power.

Coke Gas Combined with Alcohol.

The one serious and sustained practical experience with alcohol as a driving force in France is that of the Compagnie Générale des Omnibus de Paris, the heavy public vehicles of which traveled 2,218,291 miles between June 11, 1906, and November 1, 1907, propelled by a mixture of 50 per cent. of carbureted alcohol and 50 per cent. of benzol. Benzol, it may be added, is of recent manufacture in France, where it is obtained by the condensation of gases recovered from coke.

This experiment is conclusive in its material aspects, but it is successful commercially only because of the artificially high price of gasoline in the city of Paris, brought about by the imposition of an octroi tax of 20 francs per hectoliter ($3.86 per 26.41 gallons). The effect of this municipal taxation is such that in Paris gasoline was worth in November last 56 francs per hectoliter ($10.81 per 26.41 gallons) against 39 francs ($7.52) for carbureted alcohol, the octroi duty upon which is only 5.10 francs (98 cents) per hectoliter. These octroi taxes vary greatly in different municipalities, and leaving them out of consideration, the general price of gasoline in France last November was 36 francs ($6.95) per hectoliter and that of carbureted alcohol 33.90 francs ($6.54). Though the advantage as to price is apparently with carbureted alcohol, it must always be remembered that the consumption of this fuel exceeds that of gasoline by about 5 per cent. Thus, for the moment, while alcohol motors can be used and are used, no real economy has yet been effected by the use of alcohol as a driving fuel.

Government Consideration—Manufacturers' Views.

The French Parliament is now actively considering the subject in all its aspects, and the proper committee has recently summoned to its sittings various distillers of alcohol and manufacturers interested in its use. The following are translations of two letters addressed to the Parliamentary Commission by auto manufacturers. A firm at Vierzon wrote:

In reply to the questions whlch you bave addressed to us ln regard to the means necessary to extend the lndustrial and commercial use of alcohol, we beg to say that carbureted alcohol wltb 50 per cent. of benzol possesses all the advantages of gasolline. Thls product, employed ln a good carbureter, does not grease the motors, and only attacks the valves. The slight accumulation of grease whlcb we have recognized arises cblefly from the denaturing agents employed by tbe administration. Durlng several years we have made use of carbureted alcobol, and the only disadvantages which we have recognized are the difficulty of obtalning supplies while en route and the awkwardness growing out of the instablllty of prices, which discourage the partlsans of alcohol.

A concern at Billancourt wrote as follows:

We desire to state that we bave few devlces constructed for the use of alcohol, for these reasons: Up to thls time there has been no economical reason why carbureted alcohol should be employed; on the contrary, the cost of gasolline ls lower. Moreover, carbureted alcohol causes a more rapid deterloration of the motors tban gasoline, on account of the presence of water whlch ls found ln the alcohol, and which, producing a condensation upon the metallic linings, causes them to rust.

In order that pure alcohol or carbureted alcohol may replace gasoline, it ls necessary that the cost per horsepower be notably lower tban the cost obtalned by tbe use of gasoline.

It ls possible to put motors ln movement wlth carbureted alcobol without first heating them, although thls ls less easy and less sure than witb gasoline; but with pure alcohol it ls necessary to heat the carbureting apparatus by means of an exterior envelope before satisfactory results can be obtained. In conclusion, we have only utilized alcohol or carbureted alcohol ln order to conduct laboratory experiments and for one or two races.

CONCERNING THE OTHER SIDE OF THE QUESTION

WEIRD and fearful reports and articles on the dangerous man-killing automobile were rushed through the German press when the official figures of 4,864 accidents in one year, with 145 deaths and 2,419 injuries, were issued in one undifferentiated whole, says *The Car*. In order to have a carefully made analysis, the Government handed the whole of its collected material to the well-known pioneer of automobilism and technical expert, Major-General Becker, to sift causes and results, and to embody his deductions in a pamphlet. The General devoted special attention to the 145 most serious accidents, and found that the official reports divided them as follows: Thirty-five children were run over, and 52 adults; there were 22 collisions; and 23 houses, walls and trees, etc., were run into; and 13 accidents were caused by horses taking fright. Now comes the *dénouement*, which is very unpleasant for the prejudiced antimotorist. In 110 of these 145 cases the law could not enter into action, as the fault was not on the side of the motorist. When, however, punishment was deserved it was meted out heavily, and nobody could enter a plea of prejudice even in the least degree. In 58 cases there could be no police summons or law action taken; in 8 of these accidents, however, the driver himself was killed. In 42 cases legal action was commenced, and then quashed, as no case could be made out. In 10 cases the motorist was acquitted, in 2 cases the drivers could not be found. In 1 case a police fine was ordered. In 17 cases the verdicts were imprisonment from a week upward to a year and a half, and the remaining 15 cases were not settled when the statistics were issued at the end of April.

LETTERS INTERESTING AND INSTRUCTIVE

CONCERNING SOME ITEMS OF DESIGN.

Editor THE AUTOMOBILE:

[1,456.]—Please let me know through "Lettere Interesting and Instructive" how to calculate the horsepower of a gasoline motor according to the latest formula; how to calculate the size of valves for the average automobile motor; and how mucb compression space is generally used. JOHN HOFSASS, JR.

Baltimore, Md.

The latest "popular" formula is that of the Association of Licensed Automobile Manufacturers, and consists of $\frac{D^2 \times N}{2.5}$ = horsepower, in which D = bore of the cylinder; N = the number of cylinders, while the denominator, 2.5, is a constant derived from calculations on a number of standard motors generally conceded to be the most efficient types. There are hundreds of other formulas of various kinds, but none of them, seem to represent any great improvement on the old steam standard of $\frac{PLAN}{33{,}000}$ = horsepower, in which P = the mean effective pressure throughout the power stroke; L = the length of the stroke in inches; A = area of the piston head on which this pressure is exerted, thus corresponding to D^2 of the A. L. A. M. formula, while N = the number of power strokes per minute, the denominator being Watts' standard horsepower equivalent.

In earlier practice it was customary to make the inlet valve 1-4 of the cylinder in diameter, and the exhaust valve 1-3 of the bore, while the lift necessary to give a theoretical full opening of the usual poppet type of valve was 1-4 of the valve diameter. However, as precedents these figures are now valueless, it having been customary with motor designers during the past four or five years to make the valves as large as possible, and it is now nothing uncommon to find valves that are half the cylinder diameter in the case of both inlet and exhaust, while some will even exceed this by a slight margin. This permits of the reduction of the lift of the valve to obtain the same effective opening and makes a more quiet running and durable mechanism. It is customary to make the compression space 25 to 30 per cent. of the cylinder volume, but this, like many another point of motor design, is something on which numerous differences are found in practice, though most of them are not radical by any means.

WIRE SIZES USED ON MAGNETOS AND DYNAMOS.

Editor THE AUTOMOBILE:

[1,457.]—Could you please give me any information concerning the sizs wire they use on tbe magnetos and dynamos for eparking? A. DICKIE.

Newark, N. J.

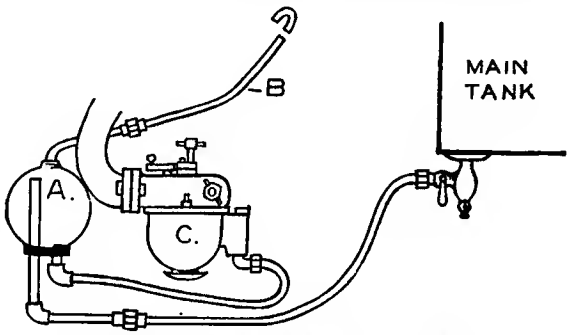
The winding of the armature of the average magneto for high-tension service is made up of wire ranging from about 30 to 25 B. and S. gauge, or its equivalent in metric sizes, in the case of foreign made machines, each maker naturally having standards of his own, but most of them are said to fall between the range given above. In the case of the armature winding of the true high-tension type of magneto in which the high-tension current is generated directly in the armature, the two windings differ very little in size. As a matter of fact, they are really a single winding. In the high-tension-with-coil type the single winding on the armature is larger, and the coil itself has the usual primary and secondary windings, the latter of which is usually of much higher resistance than is the case with the average coil for battery use. There is the same difference of opinion on the part of designers of small direct-current dynamos for ignition service as to the proper size of wire for armature and field windings, varying, of course, with the output for which the machine is intended.

OF INTEREST TO FORD OWNERS.

Editor THE AUTOMOBILE:

[1,458.]—Being a subscriber to "The Automobile," I have obtained considerable information from your letter department and have been much interested in the inquiries. I am driving a Model N Ford and bave made a few changes that I think would be interesting to others. In making any changes, I bave always proceeded in such a way tbat if euch a change was not an improvement, I could repisce things exactly as they were in the first place. Our runabout, wben received, wae adjusted so that the throttle wae only partially closed wben tbrottle lever was clear forward. This is probably necessary to prsvent amateure from stalling the engine, but it is certainly not the proper final adjustment after one has learned to master the car and the machine has become limbered up. By cbanging the set screw on the carbureter and shortening the connecting rod I adjusted the throttle to close entirely, when throttle lever ie clear forward. Now, while driving, if a quick stop is necessary, merely closing tbe throttle and applying the brakes is more efficient tban the brakee alone and the engine is also ready to act as a brake at any time by simply closing the tbrottle. This simple little change hae made driving half again as easy for myself as well as others of my acquaintance.

When driving the car the first montb or so, I kept only two or three gallons of gasolins in tbe tank and invariably on any of our steepest bills I was stalled, for the reason that tbe gasoline would not flow up-hill. I am enclosing a sketch of tbe device I



Ingenious Auxiliary Tank Fitted to Ford Runabout.

made use of to prevent this. It works to perfection. There are few continuoue grades over three miles long, and witb this device, wbenever a level or nearly level stretch ie reached, the auxiliary fills, and the steeper the next grade is the better the gaeoline from the auxiliary will flow to the carbureter.

People generally consider the Ford cars noiey, especially on the low gear, but they don't accuse our car of that now. With a 6x24-inch sheet iron tank and a few pipe fittings conecting it with the muffler that wae on the car, I have made the exhaust absolutely silent. There is no increase in tbe back pressure, for I bave made use of no baffle plates whatever, but by merely retaining and cooling the exhaust gases that much more, tbe pressure is reduced to practically nothing. Several of your correspondents have inquired into the magneto question, and I hops my experience will be of some benefit. I have attacbed and am using a K-W magneto on our runabout and find it all the makers claim for it. It did not work perfectly, however, with the coil and vibrators on the car until we bougbt a K-W Master vibrator to use in series with tbe magneto, and the old coil with vibrators shunted out. Thie capped the climax. The Master vibrator itself is as much of an improvement with either the battery system or magneto as tbe magneto is over the battery. The engine runs as smooth as silk, cranke easily on tbe magneto, and certainly ebows more power tban it ever did.

Now, if I have not taken up too much space, I would be greatly obliged for a little information on the following: Ford owners know that it is no easy matter to disassemble the carbureter in case tbe float level neede to be changed. I have read that the float level was not an all-important factor, but I think tbat the float level ehould be about right to get the best results in etarting the engine and also tbrottling it down. Instead of taking the carbureter to pieces and bending the prongs holding tbe float, why would it not be better to make a threaded gaeoline valve stem with a nut and lock nut and adjust the float level by changing the

position of this nut on the valve stem without taking the carbureter to pieces at all? Also kindly inform me as to what the makers of shaft-driven rear axle units depend upon for strength when no strut rods are used and the rear axle is fastened to the chassis merely by means of the driveshaft housing?

Otto, N. Y. DAVID L. BROWN.

There appears to be no reason why the expedient you mention with reference to being able to adjust the carbureter float level from the outside should not be feasible and work all right. While we do not believe the float level is an important factor where the mere running of the motor is concerned, and do not believe that it is responsible for erratic running in more than a fraction of the cases in which the latter is attributed to it, where economy and efficiency are concerned, it is desirable to have it adjusted properly to give the best results. The tubular housing of the driving shafts is made very strong and the sleeve surrounding the drive shaft is also made to take all the strains ordinarily imposed on the torsion rod. This type of construction has proven very successful on some prominent American cars.

BATTERIES FOR LIGHTING ON THE CAR.

Editor THE AUTOMOBILE:

[1,459.]—Will you please reply in the columns of "The Automobile" to the following? Will ordinary dry cells run a 6-volt lamp continuously for several hours at a time, or would such a lamp require a Sprague battery? There seems to be a conflict of opinion on this subject among electricians. Some say for constant use for hours at a time dry cells would polarize; others say dry cells would prove as satisfactory as storage, except possibly their life would be somewhat shorter. Can you shed some electric light on this subject? GEORGE A. FAY.

Meriden, Conn.

Dry cells would be useless for such a purpose for the reason that they would polarize, as some of your advisers have already informed you. The dry cell is what is known as an open-circuit type of cell, in that it is only designed for intermittent service. It must be allowed to recuperate between drafts upon its available supply of current. If not, it shortly fails altogether, and this was the reason why it proved so unsatisfactory for ignition service on early cars in which poorly designed coils and timers made excessive demands upon it. The storage battery is the only method of lighting such lamps, but it can be kept charged constantly by means of a direct-current generator and automatic cut-out, the former being run by the motor. Couple a six-volt lamp to six dry-cells in series and you will find that there is a drop in voltage as evidenced by the dimming of the light after a few minutes, while at the end of the tenth minute at the outside the effective candle-power will be *nil*. Probably there are few things about a car that have been so universally misunderstood as the dry cell, and for this reason it has been generally condemned, simply because it could not do what it was never designed for.

TO PREVENT RUST ON WHEEL RIMS.

Editor THE AUTOMOBILE:

[1,460.]—What is the best preventive of rust on the wheel rims of my car? The climate here is very damp, and I do a good deal of wet weather driving, with the result that I encounter continuous trouble in the way of rusted rims, which rapidly rot and cut the tires, until the casings finally are in such condition that they pull off the rim in a fashion that leaves them beyond repair. When the car and the tires were new I experienced no trouble of this sort, which I attribute to some preparation that was on the rims, but which has since worn off. If you can tell me what this was, you will greatly oblige a new recruit. ROBERT JEWETT.

Marshfield, Ore.

For the protection of tires and rims from the effects of moisture, it is usual practice to keep the latter well painted, or to give them a coat of shellac from time to time. Any neglect of this precaution is declared by the tire makers, and by most users generally, to be fatal to satisfactory results, as would appear to have been the case in your experience. We would advise you to profit by this, and hereafter keep your rims in good condition. Probably it will be necessary, before applying the first coat of shellac—which dries more quickly and is fully as effective as paint—to clean off all the rust now on the rims. This can best be done by the use of emery cloth, applied with a liberal quantity of elbow grease. It hardly seems possible that all of your trouble can have arisen from the mere rusting. From the wording of your query there would appear to have been considerable rim cutting, which never occurs except when tires are run insufficiently inflated, though rusty rims will aggravate it. Keep your tires pumped hard at all times and do not let any one dissuade you from this practice by specious arguments as to smoother and easier riding. Tires may easily become the greatest source of annoyance about a car, if improperly looked after, but if rightly cared for will afford wonderful service.

DATE OF THE FIRST SIDE-ENTRANCE TONNEAU.

Editor THE AUTOMOBILE:

[1,461.]—Through "Letters Interesting and Instructive," I wish you would tell me when the first model of American-made car with side entrance was put on the market.

Detroit, Mich. THOMAS G. MAY.

We think the 1904 models marked the first use of the side entrance tonneau which had been made possible by the lengthened wheelbases then adopted, and as it was not then the custom to bring out the model of the next succeeding year six or eight months in advance, probably the side entrance tonneau was not seen on an American car in this country much before December, 1903, or January, 1904. Doubtless some of our readers are better posted on the history of this valuable development and can give more definite dates.

A BRIEF FOR THE MAKE AND BREAK.

Editor THE AUTOMOBILE:

[1,462.]—I feel that you are doing an injustice to a splendid system of ignition in your answer to B. Seyfert, regarding the make-and-break spark. He either has a short circuit, or an almost constant contact, or his coil is of no value. I have frequently used dry cells on Duryea engines for weeks at a time, covering probably more than a thousand miles. Have also driven continuous trips with or without a night's rest between, of 150 to 300 miles with them. In these cases the contacts were set for magneto ignition and were much longer than for batteries, because we were never careful to save the magneto current. Coil makers have paid particular attention to coils for jump spark, but the make-and-break has not had this attention and few people have ever tried to produce economical coils. I made for my own use a few ironclad coils in 1898 and 1899 which had the core wires returned over the outside of the coil, thus making each wire into a horseshoe magnet and exposing it to the influence of the current more fully. This added quite materially to the efficiency and economy.

E. J. Stoddard has probably carried these experiments farther than any one else and has taken out patents on some very fine forms of make-and-break coils. And with such a coil your subscriber can run his engine with the batteries his jump spark friends have thrown away. Another thought is that this form of spark will ignite mixtures that the jump spark will not. A Duryea user in Texas, Tom Huling, has applied to his Duryea the best jump spark apparatus he can buy and finds that with this the best mileage he can get per gallon, taking a thousand miles of running for test, is 23.5, but with a fat make-and-break he gets about 30 miles. Does it not seem strange that folks will save a few cents on sparking apparatus and waste money on gasoline? Or that scientific men will argue that the size of the spark makes no difference, when anybody knows that a hot spark will fire mixtures a lean one will not; or that wet wood will burn if the kindling is sufficient. CHARLES E. DURYEA.

Reading, Pa.

A RADIATOR REPAIR THAT LOOKS GOOD.

Editor THE AUTOMOBILE:

[1,463.]—In your issue of June 18, under "Letters Interesting and Instructive" about repairing leak in Honeycomb radiator, I thought I would tell you how I repaired mine. Drain out all the watr, and mix up some Smooth-on (which is used for smoothing new castings) very stiff and hold a piece of pasteboard back of the radiator and fill three or four holes where leak was, and in fifteen minutes you can use it. A. E. GRAY.

Flandreau, S. D.

P. & S. "SIX-SIXTY" AN ENTRANT TO SIX-CYLINDER RANKS

AMONG the numerous models brought out for the present season by the Palmer & Singer Manufacturing Company, New York, none has excited more attention than the euphoniously named "P. & S. Six-Sixty," the latter part of its title showing that it is a six-cylinder car of 60 horsepower. The motor has six cylinders of 4 1-2-inch bore by 5-inch stroke, cast separately with integral water jackets, and is rated at 60 horsepower. The exhaust and inlet valves are on opposite sides of the combustion chamber, and their camshafts are located within the crankcase. The crankcase is divided horizontally into two sections, the upper half holding the bearings for the crankshaft and the camshafts, and the lower half forming an oil reservoir from which the oil is drawn and distributed to the main bearings. The crankshaft runs on seven plain bearings, bushed with a special bronze. The engine is positively lubricated by a pump that drains oil from the sump in the crankcase and delivers it to an auxiliary tank shown just above the exhaust pipe in the illustration. From this tank the oil is distributed to the seven main bearings, from which it is led through the hollow crankshaft to the crankpin, and thence up the connecting rods to the wrist-pins. The oil thrown off by the crankshaft lubricates the piston and cylinder walls, and the surplus drains into the sump. A compensating carbureter of the company's own manufacture is used; it is water jacketed, the water connections being plainly shown in the cut of the inlet side of the engine. The cooling water for the motor is drawn from the radiator by a gear pump situated on the exhaust side of the motor. Power is transmitted from the engine through a multiple disc clutch with forty-nine steel-to-steel discs. The clutch is located in the same housing with the change-speed gears. Four speeds and a reverse, operated selectively, are provided with the direct drive on the third speed, as is now customary.

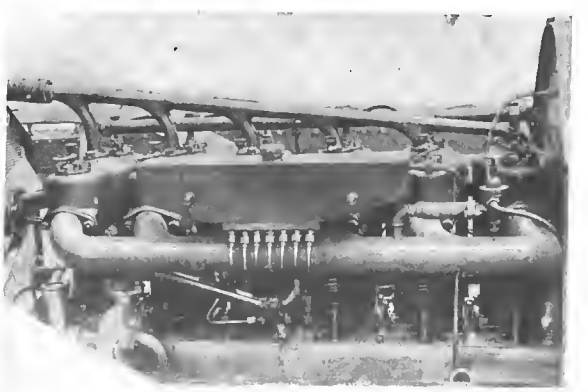
Lines of the New "P. & S. Six-Sixty," with Baby Tonneau.

The gear ratio on the third speed is 3 to 1 and on the fourth 2.1 to 1. The clutch and gears are lubricated by a non-fluid oil, and it may be a surprise to many to know that the clutch operates satisfactorily even when packed in heavy grease. The change-speed gears run on imported F. & S. bearings. These bearings are used throughout the car, with the exception of the crankshaft. The final drive is by a cardan shaft, fitted with two universal joints to the live rear axle. The universal joints are packed in grease and rendered oil-tight by leather caps. The rear axle is fitted with radius rods and a torsion rod, which insures alignment even under the most severe stresses.

Two separate and distinct systems of ignition are used—viz., a Bosch high-tension magneto, which is shown on the inlet side of motor, and a dry battery system with single coil and secondary distributer. Two sets of equalizing brakes are fitted, both operating on the rear wheels. Steering is irreversible, through worm and sector gearing, with universal joints at all steering connections. Spark and throttle levers are on a quadrant on the steering wheel convenient to the right hand, and a foot accelerator is provided. A 28-gallon fuel tank is suspended from the rear of the frame from which the fuel is forced to the carbureter by exhaust pressure. Grease cups are liberally used on all steering and spring connections.

The P. & S. "Six-Sixty," as it is called, is made in one model, but is fitted with three styles of body—viz., runabout with single rumble and double rumble seats, and light touring with baby tonneau. The wheelbase is 125 inches, with a tread of 56 inches. The frame is of channel section chrome nickel steel and trussed to insure rigidity. It is mounted in long semi-elliptic springs both in front and rear, giving easy riding qualities. The front wheels have ten spokes and the rear wheels twelve spokes, and both are fitted with 34 by 4-inch Diamond tires mounted on Marsh detachable rims, although any make of tire will be furnished at the option of the purchaser.

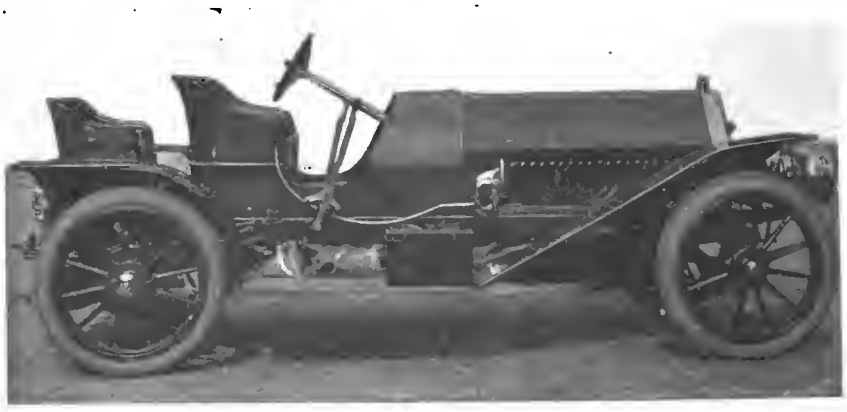
Inlet Side of Motor Showing Manifold Design.



Exhaust Side Showing Location of Oil Tank.

BRIEF SPECIFICATIONS OF THE NEW "JEWEL" ROADSTER

UNDER the title of the "Jewel 40" roadster, the Forest City Motor Car Company, Massillon, O., are building the new runabout type shown by the accompanying photograph. The motor is a four-cylinder vertical Rutenber, the dimensions of which are 4 1-2-inch bore by 5-inch stroke, and it is fitted with a Schebler carbureter. For ignition a dual system is employed, consisting of a Bosch high-tension magneto for the running side, with an Exide storage battery and Connecticut four-unit dash coil for starting and emergency use, two sets of independent spark plugs being employed, and the wiring is so arranged that either of them can be instantly brought into use by means of a switch conveniently located on the toe-board. A double system of lubrication is also employed, a self-contained oiler being placed in the crankcase, while this is supplemented by a six-feed mechanical force-feed oiler in addition.



Lines of the Latest High-powered Roadster from the West.

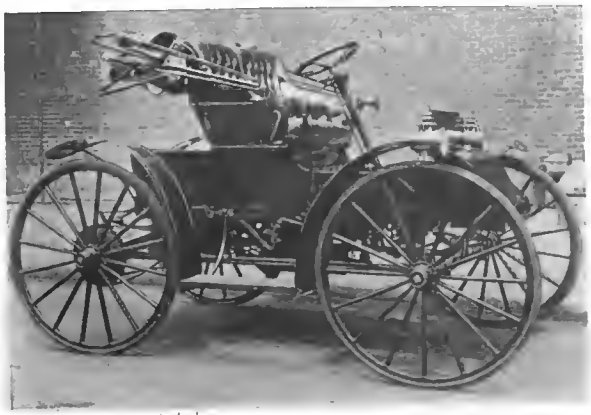
A conical type of leather-faced clutch, employing cork inserts, a three-speed sliding gear on the selective plan and a straight line drive to a full floating type of rear axle, comprises the transmission of the car, the gear ratio being rather high, that is, 2.5 to 1. The front axle is a one-piece drop forging of I-beam section, the front and rear wheels being carried on Timken roller-bearings, while the same type is also employed on the gear-set and steering knuckles. The frame is of the usual channel section pressed-steel construction and is supported on semi-elliptic springs forward and a platform type of suspension in the rear. Double brakes of the usual internal expanding and external contracting types placed in special drums on the rear wheels are fitted.

ANOTHER BUGGYABOUT HAILING FROM THE EAST

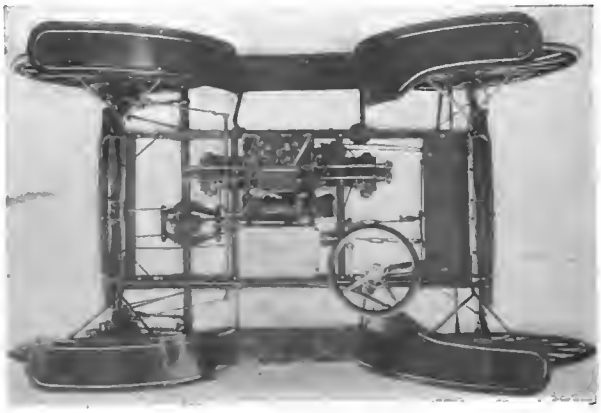
THOUGH this part of the country was the home of the buggy type of automobile in that the pioneer American automobile that wrote its name large on the history of the then nascent industry, hailed from Pennsylvania, the Middle West really discovered its value and the large field that exists for it. Now, however, interest in these handy little vehicles again seems to be shifting eastward, as evidenced by the production of a car of this type right in New York City. This is the P. M. C. solid tire runabout, which is being built by the C. S. Peets Manufacturing Company, 60 West Forty-third street, New York City.

The power plant consists of a two-cylinder horizontal opposed, air-cooled motor, the cylinder dimensions of which are 4 1-8 by 3 3-4 inches, while its rating is 12 horsepower. Lubrication is taken care of by a six-way automatic force-feed lubricator, while ignition is of the high-tension type, employing a set of dry cells and a double-unit dash coil and low-tension timer. The carbureter is a Breeze automatic. As will be evident from the plan view of the chassis, the motor has been placed practically in the center of the heavy angle-steel frame, while the drive from it is first taken to a countershaft from the two-speed and reverse planetary gear-set, and thence to the rear wheels by double chains.

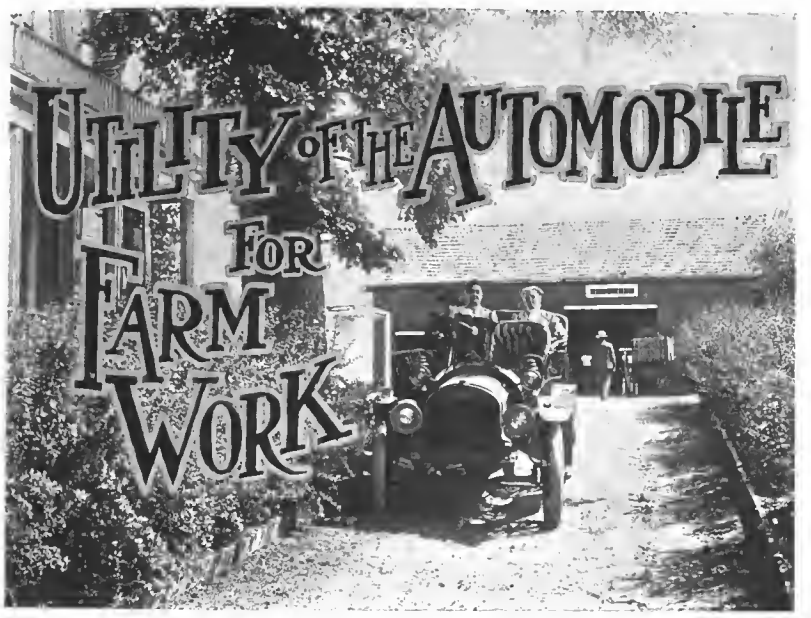
Brakes are of the band type, placed on rear wheel drums, while the wheels are 38 inches in diameter and are shod with 1 1-4-inch solid rubber tires. The wheelbase is 70 inches, while the tread is standard; complete the car tips the scales at 900 pounds and lists at $550, the top being extra.



P. M. C. Solid Tired Runabout Ready for the Road.



Plan View of Chassis P. M. C. Solid Tired Runabout.



On Pleasure Bound—No Small Rôle in the Life of the Farmer's Auto.

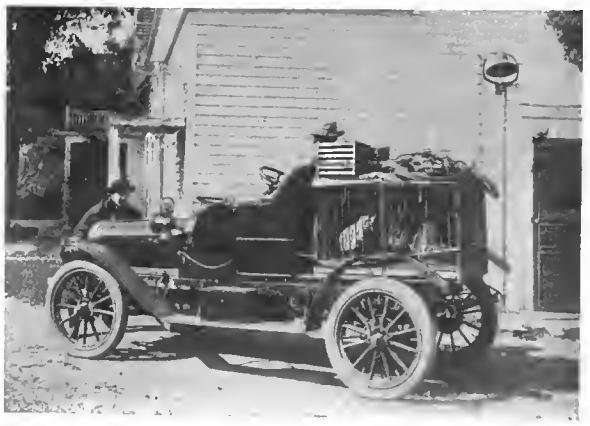
THAT there is an especially rapid and growing tendency to-day among the most far-sighted of American farmers to so systematize their farm business as to effect the greatest saving in time, labor and expense is aptly demonstrated by the general adoption of what is known as the utility, or practical, automobile on thousands of the best managed farms. While time and labor-saving machinery has marvelously widened the range of his productive capacity, the means by which the farmer himself was to keep pace with this progress has been a longer time in coming. The average farmer spends too much time getting from place to place. He works his horses almost as hard whether he is taking a load of produce to the city or just going in on business. The care and attention required by horses incident to a pleasure drive, a trip to church or to town is just as great as the task of preparing them for work in the field. But the most discouraging fact of all is this—the farmer himself and his family rarely can give any time to recreation.

If the practical automobile accomplished no more than to save a farmer's time, to provide pleasure and health to his family and to leave his horses fresh for that work for which they are better fitted it would certainly be a good investment. The fact seems to have been amply proven that the dependable utility car actually costs less to keep, can do ten times as much of different classes of work, is always ready for service and is much less troublesome to care for than the horse. Ten years ago the automobile was an experiment. With the reckless rich it is still a fad. But to-day some types of automobiles are so designed that they have become a practical success and a recognized necessity. Now that a strong, durable, common sense machine that uses very little fuel can be had at a reasonable price, we find country people in many localities enjoying the comfort, convenience and economy of good automobiles.

There are some striking differences in automobiles. The car that would give satisfactory service on the city pavement and the level country might be a failure on the farm. Given a machine that hills cannot feaze nor muddy roads balk, and important requirements of the farmer have been met. That gasoline is the cheapest motive power known has been amply proven. It has been definitely shown that in the most dependable cars the average cost of fuel and lubricating oil would not exceed one cent per mile, and this for a car capable of carrying five passengers. A driving horse ordinarily cannot travel more than 50,000 miles during his lifetime, even though he does not go lame. Many automobiles cover a great part of this distance in one or two seasons. That the horse has his rightful place on the farm is not yet to be denied. There is certain work which he can do which the automobile cannot, but it is mostly in the field—certainly not on the road. Consider the convenience to be enjoyed if in thirty minutes a man living fifteen miles from town can, should occasion require, make a trip to the city, transact his business and run back, spending but one hour on the road. Horses for certain kinds of service, including work horses and thoroughbreds, will always be in demand, but to-day the farmer cannot allow sentiment to stand in the way of his own comfort, his own profit and his own business progress, and the average American farmer is too far sighted to do so.

Like the telephone, the trolley car and the rural free delivery, the automobile has naturally come to weld a firmer link between the business men of the country and of the city. Farms in Texas which could not be sold, in spite of their greater fertility, before the arrival of the practical automobile, are now greatly

Milk That Would Otherwise Be Fed to Pigs Owing to the Distance from Market.



Only One of the Many Uses of the Car.

increased in value and brought within what is considered easy distance of the market, although this distance is often between thirty and forty miles. When it is considered that the utility automobile possesses such power equipment that it can travel the worst roads in any season of the year, can negotiate any hills which could be climbed with a horse and wagon and requires but the simplest attention, it seems to be pretty well adapted to the uses of the farm.

The expense of up-keep in some cars has been reduced until to-day a man can operate a car, spending less for oil and gasoline than the cost of feeding a horse. It is worthy of note that the car is a matter of expense only when in actual operation, and that while in operation its road capacity is at least four times that of a horse-driven vehicle. As for repairs, if the car is given reasonable care and attention, they should be little in excess of the cost of shoeing and repairs on harness, etc. In point of operating knowledge, even were this not simple enough, the farmer has a great advantage. Primarily, he is more of a mechanic of necessity than the city man. But his chief advantage lies in the fact that he knows something about machinery and is, therefore, able to save the expense of practically all repairs that might become necessary through accident. The foregoing photographs were taken on the farm of a Rambler owner. He is an old horseman and he still retains his horses for that farm work to which they are best adapted. However, as a means of saving time, he uses the automobile, and it goes without saying that he is but the forerunner of a vast army of American farmers who will shortly come to recognize the great possibilities that the automobile holds for them, and then the now prevailing prejudice against the power machine will disappear entirely.

It Is a General Utility Vehicle for Everything.

STANDARDIZATION RATHER THAN SPEED.

The "Canadian brother" coments favorably on the American automobile manufacturer, as will be noted in the following, taken from a recent issue of the Toronto *World*:

American manufacturers are naturally proud of the number of automobiles which are constructed and sold every year in this country, but the output, instead of lessening, will be increased over and over again. No man can forecast precisely what direction the development of the industry will take, but, speaking in a general sense, the dominant tendency from now on will be towards standardization rather than speed. This means, of course, the construction of an automobile which will be staunch enough to last not for one season alone but for an indefinite period, and render for that period continuous service with an imperceptible amount of wear and tear. This tendency toward staunchness and standardization will have the effect of putting the automobile business on a sounder basis, financially and otherwise, than it has ever been up to the present moment. Standardization will tend to discourage cheap and careless manufacture.

THERE ARE MANY WAYS OF USING A CAR.

No market for automobiles is opening faster than that presented by the farmers throughout the entire country. Prosperous beyond all previous experience, they have the money to spend and are spending it for automobiles, as the books of any car manufacturer will show. Presumably the

How an Old Ford Makes the Sawdust Fly.

farmer buys a car primarily for pleasure, but its practical valuc quickly appeals to him and is as quickly put to test, so tbat the car that was bougbt for pleasure is at daybreak grinding feed for the cattle and cutting wood for the fires, and then takes the children to school. At noon it brings the farm hands in to dinner, in the afternoon it runs the dairy or pulls a snow plow or a road scraper, and at night is used for a pleasure trip. An illustration of the practical value of the automobile is found in Louisburg, Kan. C. C. Williams bought a Ford runabout three years ago and recently he bought a second. The picture shows the original car cutting wood.

PROPOSED BOULEVARD SYSTEM FOR MONTREAL.

MONTREAL, QUE., July 3.—Plans for beautifying the city of Montreal by the establishment of boulevards and driveways have been submitted to the parks and ferries committee by the Architects' Association of Montreal. The idea is to have a great boulevard from Mount Royal to St. Helen's Island, across the river from Montreal. The plans comprise the first systematic attempt to establish boulevards or driveways between the various parks of the city at anything like a reasonable cost, as it is contemplated utilizing the streets and property of the city practically all the way, so that it has been found possible to greatly reduce the appropriation necessary to carry out the work.

WITH THE MANY UPHOLDERS OF THE LAW

WARD LAW GREATLY CONFUSES OHIOANS.

COLUMBUS, O., July 6.—There seems to be much confusion in the minds of owners as to the provisions of the Ward automobile law and the interpretation of it by Secretary of State Thompson. Some bave interpreted the statement of Secretary Thompson that he would disregard the opinion of the solicitor of Cincinnati as to the right of cities to issue licenses, to mean that he will ignore the provision of the Ward law, which exempts for this year all autos which have paid city licenses. Letters are pouring in upon the secretary protesting against this.

The Ward law expressly exempts all machines owned in cities requiring annual licenses, and which licenses have been paid for 1908. Such machines will be exempt this year, but next year will come under the law and pay licenses to the State, excepting in Cleveland, where a perpetual license ordinance exists. Those who have such licenses must pay the State license this year. City licenses will be optional with the local governments.

Two serious defects have been discovered in the Ward law. There is no authority for putting a date mark on the tags, and no one can tell whether the license a tag represents is in force or has expired. Again there is no license year established. Each license issued will be good for one year from date, so that licenses will be continually expiring. This will make the enforcement of the law very difficult.

A VERY INGENIOUS AUTO TRAP.

PERTH AMBOY, June 17.—Catching offending automobilists by electricity is the latest device of the New Jerseyites. Detective Lester J. Underhill, of this city, is the prime mover in the latest scheme now being worked in this part of New Jersey.

The device consists of a large wooden reel containing 1,370 feet of two-strand insulated wire, six battery cells, push buttons and bells. Underhill and his assistants carry this apparatus to some point along the post road and stretch the wire by the roadside. As soon as an auto reaches a point opposite the first man the signal is flashed over the wire to Underhill, at the other end, and he immediately catches the moment on one of two stop-watches which he holds. The second watch is stopped when the auto passes him, and he rapidly takes the time elapsed. If it is over the speed limit, he signals a third man to flag the auto, and if those in the machine ignore the warning, a fourth man stretches a rope across the highway.

In answer to criticism about the use of the rope, Underhill said to THE AUTOMOBILE man that it was not for the purpose of wrecking the machine, but is simply used to make the driver of an offending car reduce speed long enough to enable the constable to secure the number of the car.

SUSTAINING EQUAL RIGHTS ON THE ROAD.

WORCESTER, MASS., June 28.—Judge Sherman, sitting in the Norfolk Superior Court, has ruled that automobiles have as much right in a roadway as carriages, and that chauffeurs are within their rights in sounding a warning horn. This decision was handed down in a suit for damages caused by a runaway horse that had been frightened by an automobile horn. Decision was in favor of the defendant and establishes a good precedent.

HARTFORD TO BAR MUFFLER CUT-OUT.

HARTFORD, CONN., July 6.—It is evident that the Hartford police will insist on the discontinuance of the use of the muffler cut-outs within the business sections at least. The mayor has circulated a warning among the autoists to abate the nuisance of "too much noise." The Automobile Club of Hartford has taken the matter up and will prosecute it vigorously.

WHERE BULLET PROOF TIRES ARE WANTED.

WASHINGTON, D. C., July 6.—Automobilists in this city are threatened with another warfare similar to that waged against them by Marshal Collins on the Conduit road. The latest aspirant for fame as an automobile baiter is Bailiff Hewitt, of Rockville, Md., who has been granted authority by the council of that town to disable the car of any automobilist who exceeds the speed limit of six miles an hour and who declines to halt at command. Bailiff Hewitt is reported to be a crack revolver shot, and has spread the news that in enforcing the town ordinance regulating the speed of automobiles he will not hesitate to fire at the tires of the machine if the driver fails to halt when commanded. There is a fine pike leading from Washington to Rockville, and it is used by hundreds of automobilists. Infractions of the Rockville speed law have been overlooked by the town authorities, and as a result some automobilists have come to the conclusion that they had a free rein when using the pike. The consequence is that many will suffer for the faults of a few. The Automobile Club of Washington will likely step into the breach and straighten out matters to the satisfaction of all concerned.

TAX, NOT TOLL, FOR MARYLANDERS.

BALTIMORE, July 6.—City Collector Frank Brown has expressed himself most emphatically in favor of an extra session of the legislature being called to pass suitable laws to check speeding of automobiles within the State. He declares the indifferent action of certain autoists does more to ruin the roads than anything else, and he does not think the State should spend any of the $5,000,000 at its command for improved highways until proper action is taken against speeding autoists. Ex-Governor Warfield and other influential Marylanders have expressed themselves as favorable to Governor Crothers' suggestion to tax autoists, and in this way have them help the good roads cause. They point out that on the new proposed State roads the autoists will not have to pay tolls as they have to do at present on the pikes. The tax would be a small item compared to the excessive tolls charged by turnpike companies.

BALTIMORE HAS "GASOLINE SQUAD."

BALTIMORE, MD., July 2.—The Baltimore Police Department has organized a motorcycle squad for duty along the smooth thoroughfares of the city. These streets have been used as speedways by a certain class of autoists, scaring horses and making it dangerous for pedestrians. The police believe that they will be better able to apprehend these law violators with the aid of motorcycles. The motor police of Druid Hill Park have done effective work, and this has led to the organization of the squad in the city.

MOTORCYCLISTS LICENSED IN SCRANTON.

SCRANTON, PA., July 2.—Hereafter motorcycles will have to be licensed before they can continue to "chug" through this city—that is, if the arrest of A. D. Beemer stands for anything. Beemer was arrested and hauled into police headquarters for motoring without a license. Sentence was suspended, and straightaway the remaining twenty-one motorcyclists took out licenses—also Beemer.

LOWER CANADA LEGAL HAPPENINGS.

CHARLOTTETOWN, P. E. I., July 3.—As recently intimated in THE AUTOMOBILE, several automobile owners have made a test of the anti-automobile law by taking a previously announced spin around the city. Information was laid and the men were fined $500 and costs. Application to quash the conviction was made.

MOTOR EXPRESS MONEY MAKER.

OAKLAND, CAL., June 29.—The wonderful increase in the business of the Interurban Motor Express Company, of this city, since its organization in January, 1907, is due to the use of the modern motor truck, that has demonstrated in every way its superiority over the horse-drawn vehicle. What appeals to business men is the promptness with which business is handled, and the motor company has not been forced to reduce rates in order to secure patronage.

Because of the fact that so much of the freight from the East has to be handled here before being taken to a San Francisco destination, the Interurban Company has come into a vast amount of business. In order to overcome an extra handling of freight, the company has contracts with many of the large wholesale concerns across the bay, and after the loading of trucks here, the vehicle is run across on the ferry and the deliveries made. This business has increased to such proportions that the two large trucks devoted entirely to the trans-bay traffic are at times insufficient to care for it, and for that purpose trailers have been provided to keep up with the demand.

Aside from these large trucks, which are six-ton Americans, the company operates six two-ton Knox trucks. The company will receive six more cars during the summer, two of which are

Roomy Garage of the Oakland Auto Express Service.

five and a half-ton, while four are three and a half-ton electrics, built by the Auto Car Equipment Company, of Buffalo, N. Y.

F. P. Childs, the traffic manager has had a wide experience in the express business, having been for a number of years prior to the organization of the new company engaged in the business with horse-drawn vehicles. He can consequently speak with authority. He said, in discussing the motor business:

One of our small trucks can in a day's work make the same number of deliveries that four teams can, and at half the expense. That may probably not be the case throughout the United States, but it certainly is here in Oakland. Our smaller trucks cover Oakland, Berkeley, Almeda, Hayward and San Leandro. Throughout this entire territory the roads are perfectly level and macadamized, so there is probably no place in the country where trucks can be operated at a smaller expense than here. One of our smaller trucks has covered seventy-five miles in one day's work on ten gallons of gasoline. The excellent streets also minimize breakdowns, and our troubles in that respect are probably extremely low as compared with express companies of other cities.

Some of the leading business men of Oakland are interested in the company, which was organized with a capital stock of $160,000. The garage is used exclusively for the purposes of the company. It is equipped with a complete workshop and all facilities for the maintenance of the trucks.

MARYLAND'S BIG "GOOD ROADS" FUND.

BALTIMORE, July 3.—The Good Roads Commission has visited a number of Western Maryland towns recently. These visits and resultant meetings will take place in every section of the State before actual work on highway improvements begin. It is said that an additional appropriation will be added to the $5,000,000 already granted by the last legislature.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

Dec. 31-Jan. 7..—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, general manager, 29 West 42d St.

Jan. 16-23.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. Office of Secretary, 7 West 42d St., New York City.

February, 1909..—Chicago Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. (Exact date to be announced.)

Races, Hill-climbs, etc.

July 11-15.....—Milwaukee, Wis., Wisconsin Trophy Run, Milwaukee Automobile Club.

July 15.....—St. Paul, Minn., Race Meet, Automobile Club of St. Paul, H. S. Johnson, Secretary.

Aug. 14.....—Chicago, Third Annual Algonquin Hill Climb, Chicago Motor Club.

Sept. 5-9.....—San Francisco-Los Angeles Reliability Run, Automobile Dealers' Association of San Francisco.

Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.

Oct. 24.....—Vanderbilt Cup Race, Long Island Course, auspices of Vanderbilt Cup Commission.

Nov. 26.....—Savannah, Ga., Grand Prize Race, Savannah Automobile Club.

FOREIGN.

Shows.

Oct. 11-18.....—Paris, International Congress and Public Exhibition on Roads and Road Making for Modern Locomotion, French Ministry of Public Works.

Nov. 28-Dec. 13—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France.

Races, Hill-climbs, etc.

July 13-17.....—Ostend, Belgium, International Race Week, Automobile Club of Ostend.

Aug. 12.....—Ardennes Circuit Races and Coupe de Liederkerke, Automobile Club of Belgium.

August.....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)

Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vaucluslen Automobile Club.

Sept. 1-8.....—French Voiturette Contest, Auspices "L'Auto."

Sept. 6.....—Bologne, Italy, Florio Cup Race, Automobile Club of Bologne.

September.....—Paris, Vichy Aeroplane Competition, $4,000 Prizes, Aero Club of France.

Oct. 11.....—Berlin, Germany, Gordon-Bennett Balloon Race, Aeronautical Club of Berlin.

NEW BOOK FOR AUTOMOBILISTS.

Motor Rivals.—This is the latest work of fiction in which the automobile figures prominently. Percy F. Megargel, the transcontinental automobilist, and Grace Sartwill Mason, short story writer, have collaborated in the production, which is being brought out by the Baker & Taylor Company, New York. "Motor Rivals" is a delightfully entertaining novel, based on an automobile race from New York to Portland, Ore.—a route twice covered by Megargel. It treats vividly of various incidents of a trip, shows the usual viscissitudes, and tells how difficulties were overcome far away from civilization and the repair shop, and as the author, or at least one of them, has been through all the experiences himself, he is in an excellent position to tell them interestingly.

For those who are not particularly interested in automobiling, and even some who are, a strong love story is interwoven throughout the race. The race itself is between a medium-power car of American build and a large foreign car of much greater horsepower. The book will be out July 25. The story promises to be a great success.

Three Days with the Autoists in the Scottish Reliability Trials

GLASGOW, June 19.—For the first time for over a week fine weather has signalized to-day's run of 130 miles from Oben, which completes the Scottish portion of the combined trials. To-morrow a start will be made on the journey southwards, ending with a 200-mile race at Brooklands next Friday, but only half the cars will be seen on the road, and thereby hangs a tale.

The requirements of the British trade and buying public alike have hitherto been well served by the searching reliability trials held each year by the Scottish and Irish clubs, and the number of entries—there were 108 for the last Scottish event—have shown the satisfactory nature of the test and of the system of marking. This year the Royal Automobile Club determined to organize a trial which would altogether eclipse the doings of its affiliated clubs, and the present 2,000-mile event is the outcome. The system of marking is novel, but it has yet to be proved superior to the older method, which took into separate account the three factors of reliability, fuel consumption and hill-climbing power. In the present case the Royal Automobile Club has taken the 2,000 miles of road traveling as a preliminary to the final 200 miles race at Brooklands, and the method of marking determines the handicap at the start of the race. Each stop of one minute on the road means one minute's handicap in the race; similarly with the petrol used, each gallon is counted as one minute's delay. In the hill climbs, which total in all to a distance of 22 miles, the penalty for each car is fixed by the number of minutes it is behind the fastest car in its class. The main advantages of such a system as this lie in its simplicity and in the fact that the first car in each class to pass the finishing line will be the winner. Opposed to this, however, is the possibility of an unreliable car going through the trial with constant repairs and tinkering, and on the track proving victorious by virtue of being hopelessly overgeared and by having an extra fourth speed in reserve, which would give it a great advantage.

The popularity of the event can best be judged by the number of starters, 46, while for the Scottish trial, which, although combined with the 2,000-mile event, can be entered for separately, no less than 84 cars set out.

Owing to the absence of the Fords, which would have to compete in a class altogether disproportionate to their price, the number of American entries were but three—a Cadillac and two White steamers.

On Thursday, June 11, the start was made from London, the new White steamer depot and repair works at Camden Town being the official rendezvous. In three daily stages of 150 miles the cars were driven to Glasgow by Saturday night. Excepting the awful weather conditions, this first portion of the tour was singularly uneventful. Mention might be made of the 10-horsepower Zedel, which had been turned out from its German birthplace without a key being fitted to the small differential driving pinion. For over eleven hours the driver and mechanic worked in the rain and finally made a new key out of a spanner, the car continuing the trial as if nothing had happened.

On Monday the route planned by the Scottish Club took the cars through Blairgowne to Aberdeen. The severer nature of the country began to tell its tale, and a trouble frequently in evidence was the overgearing, which had been done to give a good showing in the race at Brooklands. In the afternoon the cars were timed on the Devil's Elbow climb at Glenshee, the highest road in the kingdom, and here the most unusual sight was to be witnessed of a score of well-known cars, of powers up to

Making the Turn at Devil's Elbow, Glenshee.

30-horsepower, having to shed their passengers and to invoke outside assistance. When starting from the line at this event the drivers of the 30-horsepower White tried to get away too quickly and stripped one of the pinions on the rear axle, causing the withdrawal of this car.

Tuesday's run to Inverness included the dreaded Cavin O'Mount, by far the worst climb of the whole tour. On this narrow road the occasional failures blocked the way to all the succeeding cars, and the resulting chaos delayed the arrival of the last cars at the stopping place till after midnight. These delays have also been responsible for the withholding of the official reports till the end of this week, so that it is impossible at present to give any indication of the relative performances of the leading cars.

SOME RECENT BRITISH AUTO DOINGS.

LONDON, June 29.—The past few weeks have been full of activity in the motor world. The Irish Reliability Trials just recently completed are now eclipsed by the more elaborate 2,000-mile event of the Royal Automobile Club, which, to the general mystification of competitors, trade, and public alike, is run conjointly with the Scottish Trials. More concerning this elsewhere; sufficient is it to refer to these events, to the Brooklands meets and to the constant succession of hill-climbs and speed trials to show the sudden accession of vitality which is characterizing the trade at present.

And, speaking of trade, it is pleasant to be able to report that this is strongly on the advance. Britain did not escape the universal slump which has overtaken the motor trade of the world during the past half year, but, fortunately, the effects were not so pronounced as in France or Italy, due, doubtless to the small car trade which the British manufacturer has so well developed and fostered. Not a few firms have disappeared from sight during the period of depression, and more especially so with the agencies for foreign and American cars.

A pair of American cars which go well with the public on this side are the Cadillac and the Ford. The former is noted for its reliability and has a fine record covering all the trials of note during the past three years. This car scored well by the success of the unique standardization test to which it was recently subjected by the Royal Automobile Club committee and which was referred to in these pages at the time. No less remarkable have been the victories of the 15-horsepower Ford. At the commencement of the season two press men visited the London showrooms of the agents and selected at random two cars to be run in all the coming competitions. In their first event at Brooklands the pair ran second and third; next time it was first and second; several hill-climbs have brought them out with fastest times, and finally a gold medal was awarded to No. 1 in the recent Irish trials. The second car did a fine performance up hill the last day of the same event, when some slight carbureter derangement spoiled its record. Unfortunately these two cars are not running in the 2,000-mile trials, as they cannot be entered except in a class which contains cars of over double price, but it will be interesting to follow the fortunes of the pair throughout the rest of the season.

It is generally supposed that motorcycling is a sport which has not acquired much popularity in the States, but in any case news of a recent big event of the London Motor Cycling Club cannot be without interest. Each year this parent club runs off a trial from London to Edinburgh, the 400 miles between the two capitals having to be covered in between 20 and 24 hours. Granted that the roads are for the most part in excellent condition, the length of the run, together with the time limit, gives it special merit. No less than 106 entered and started, added to which were a dozen cars owned by members of the club, who have now forsaken the single track machine.

In spite of the unfavorable weather, no less than 74 of the motorcyclists finished within schedule time. After a day's rest, twelve of these set out again on the return journey to compete for the Schulte Cup, offered for the greatest speed regularity over the 800 miles total trip. Of the twelve, but two failed to reach London within schedule time. An event of this description not only well demonstrates the extraordinary reliability of the modern motorcycle, but also serves to show the great popularity of this type of machine. It is estimated from official figures that the number of motorcycles in use in the United Kingdom is well over 50,000 at the present time, and this total is increasing at an extremely rapid rate.

NUMEROUS ROUND-THE-WORLD DRIVERS IN PARIS

PARIS, June 30.—Though the Round-the-World contestants have not yet finished their trip, a curious combination of circumstances brought many of them together a few days ago in Paris. Montague Roberts, who started on the Thomas Flyer from New York last February, but was withdrawn for the Briarcliff and Grand Prix races, accidentally met the De Dion team while on a brief run up to the capital. M. Autran, who had had charge of the mechanical end of the De Dion car, explained that he had just come in from Vladivostock, by order of the factory.

"Before I left the car," declared Autran, "I turned all our gasoline over to the Thomas car. It is true, as reported by cable, that St. Chaffray sought to corner the gasoline supply of the town in order to command a seat on the Thomas car, but as I had no further interest in the race, the factory having recalled me, I gave up all our fuel to the American."

There are not many kind words in Paris and at the De Dion factory for St. Chaffray, who at the start was so much in the public eye and figured as the mainspring of the trip. According to the statements of the De Dion engineer it was the inexperience and ignorance of the *Matin* delegate that prevented the De Dion car from making a better showing. "St. Chaffray was only capable of driving an automobile under the most favorable conditions. Every time he took the wheel on the bad roads of America he ditched the car. By driving over a steep embankment he broke the frame of the car, and on two occasions unskilful handling was responsible for the breakage of the driving shaft."

On arriving at Vladivostock the De Dion car was sold and is now in the hands of a private owner in Japan.

As if to show that there was no animosity for the beating they had received in the Round-the-World trip, the De Dion officials received Montague Roberts heartily at the factory, conducted him over the huge works and finally presented him to the Marquis de Dion, head of the firm of De Dion, Bouton & Cie., who congratulated the young American driver on his plucky driving in the initial stages of the long trip when it was far from certain that any of the cars would finish.

PARIS SALON WILL THIS YEAR BE TWO SHOWS

PARIS, July 1.—After the lavish pyrotechnic display of the tenth annual automobile salon, Paris is to have an economical era, the first signs of which are to be found in the decision taken this week by the organizing committee to abandon the huge temporary hall on the Esplanade des Invalides. This year there will be two Paris salons, the first one opening on Saturday, November 28, and closing on Sunday evening, December 13, and the second one keeping open its doors from December 22 to December 29. Both exhibitions will be held in the Grand Palais on the Champs Elysées, the initial event being for all kinds of pleasure vehicles, accessories, motorcycles and bicycles. The second show will comprise all classes of commercial automobiles, machine tools, etc., and will close the Paris auto year.

For several years past it has been the custom to hold the Paris automobile show in two distinct buildings, the Grand Palais taking the pleasure cars and some other building the commercial section. As the industrial vehicle grew in importance the greenhouses on the banks of the Seine became too cramped to accommodate the annex, with the result that for 1906 special permission was obtained from the city of Paris to erect a temporary building on the Esplanade des Invalides. The same was done last year, the temporary hall, erected at great cost and pulled down immediately after the show, having a floor area exceeding that of the Grand Palais itself.

It was an expensive matter to put up a temporary hall three times the size of Madison Square Garden, as exhibitors found to their cost. It entailed also the providing of two sets of decorations for those firms, now numerous, who make both pleasure and commercial vehicles; those who have seen the Paris show know how costly the decorations have been in every case.

This year, while there will not be much diminution in the general scale of decorations provided by the organizing committee, exhibitors are recommended to spend less on their stands than they have done in the past, a recommendation that appears likely to be followed. Those firms who are exhibiting at both shows will naturally be able to retain the same decorations for the two events, there being an interval of but eight days between the closing of the pleasure car and the opening of the industrial vehicle show that is scheduled to follow it.

Abuses in connection with the season and press passes are to be brought to an end. In the past free passes have been distributed generously on the opening and popular days of the show. Employees of exhibiting firms are known to have gathered together the greatest number of free passes, and either given them or sold them to their friends. There are quite a number of Parisians, too, who, rather than pay a modest franc for admission, have put in an application for a press ticket, declaring that they were connected with some foreign journal. Such practices will be stopped next year, all passes being made personal, and all members of the press being called upon to prove their journalistic connection before being allowed to take out a card, so that this source of loss will go.

FRANCE RESOLVES TO HAVE A BIG AUTODROME

PARIS, June 30.—Auvergne is resolved to have the first autodrome in France, or, as they prefer to call it here, the closed racing circuit. Immediately after the Gordon-Bennett race of 1905 the mountainous course in Auvergne was proposed as a permanent racecourse, but owing to financial difficulties and the disinclination to give any one region the monopoly of automobile races the matter was not pushed forward by the A. C. F.

For the last three years the Automobile Club of Auvergne has boomed the scheme of a racecourse around the Puy du Dome, and has further studied the financial question. This week the local club invited the Automobile Club of France to the district in order to convince the national body of the practicability of the scheme and to give them an idea of the interest of the neighborhood in a motor racecourse. The Competition Committee, with Marquis de Dion at its head, accepted the invitation, traveled down to Clermont-Ferrand by special train, were taken up to the summit of the mountain by a special local and shown the proposed road on the way, a beautiful view being had.

From the summit of the mountain, 4,800 feet above sea level, a magnificent panorama unrolls itself in every direction. The road which it is intended to use as a motor course runs around the face of the mountain, and is almost all visible from the summit. A small portion of the projected course is the highway on which the Gordon-Bennett race was held in 1905. Though all roads are made and in excellent condition, a considerable amount will have to be expended in barricading them, lighting, and generally fitting for fast automobile work. Clermont-Ferrand, best known to automobilists as the home of Michelin and other tire factories, is at the foot of the mountain and within a short distance are a string of holiday resorts. If the project is accepted by the Automobile Club of France the land within the course will be fitted up for other sports, including cycling, aeronautics and athletic games. One of the objections made to the Auvergne course is its distance from Paris. As the majority of the automobile factories are located around the capital, before any use could be made of the course as a testing ground it would be necessary for cars to make a journey of about 240 miles, which manufacturers naturally consider excessive.

PREPARING FOR WORLD'S ROAD CONFAB.

PARIS, July 1.—Preparations are now well advanced for the international road conference which the French Government will hold in Paris on October 11 and the seven following days. It has been decided during the week of the conference to hold a public exhibition in the Tuileries Gardens showing samples of road, tools and machinery for road making, road signs, etc.—in a word, everything relating to the construction and upkeep of urban and rural highways. Minister of Public Works Barthou has recently taken the further decision to invite all nations to a second conference to run concurrently with the first, at which the question of international road regulations, and more particularly the problem of facilitating international communication, will be discussed at considerable length.

FAMOUS PARIS AUTO AGENT RETIRES.

PARIS, July 1.—C. L. Charley, who is well known both in Europe and the United States as the selling agent of the Mercedes Company, has now severed all connection with the automobile trade. A few months ago Mr. Charley retired from the management of the Mercedes selling house in the Champs-Elysées, Paris, and has this week made a deal with Harvey DuCros, of London, who takes over the remaining stock of the Mercedes chassis, for which the Paris dealer had contracted. At one time M. Charley was a power in the automobile trade abroad, and at the same time he was doubtless the chief moving power in the introduction of the German-made car in the United States, where, through his efforts, it achieved a reputation in a very short time, quite a large number being sold.

PROGRESS OF THE GOOD ROADS MOVEMENT.

It goes without saying that the Good Roads and Legislative Convention, now being held in Buffalo, will accomplish more to awaken public sentiment generally to the crying need for highway improvement in this country than any single step that has been taken in this direction up to the present. It is the culmination of a number of years of struggling toward the goal for which not alone the autoist, but the farmer, the suburbanite and the city dweller also are bound, for there is no one who is not influenced by the solution of the good roads problem. But while it marks the end of a long struggle, it is only the beginning of a far greater campaign that must be carried on relentlessly for a number of years before the results growing out of the preliminary work can accrue. The good roads advocates have won out in the battle for recognition from State and local authorities, and in the meantime a great deal of actual improvement work has been carried out, but when compared with the hundreds of thousands of miles of roads in the East alone, it must be realized that the task has only been begun.

There is yet a vast educational campaign to be carried on, and here the Buffalo convention is starting the entering wedge, as the practical demonstrations there carried out are on a larger scale than anything of the kind previously attempted. In fact, they represent the most comprehensive showing of methods of road building that has ever been undertaken. Before we can have an extensive system of good roads people who do not know the meaning of the term must be shown how to construct them—not so that they will need rebuilding a few years hence, but so that once in place, with the proper maintenance, they will last for all time. And here again is a vast branch of the subject, road maintenance, on which the demonstrations at the convention should have a very perceptible effect. No matter how well a road is constructed, if it be not properly cared for, its life must necessarily be short, and it is consequently of equally great importance not alone that people be taught how to build good roads, but also how to take care of them. Last but not least, the results of the convention will be felt in the increased sentiment for uniform legislation, for which the A. A. A. is consistently working. There cannot be the slightest doubt that the convention will become an annual fixture henceforth, and that through it the American Automobile Association will be enabled to accomplish many times the good it has done in similar lines heretofore.

* * *

PRESENT TREND OF IGNITION PRACTISE.

Five years ago the magneto was already a well-established part of the equipment of the average foreign car, but it was practically unknown on automobiles built on this side of the Atlantic. European designers had found it simple, practical and dependable to a much greater degree than was the case with the coil and battery system, but as a general rule the American maker would have none of it. Beneath the more or less general prejudice manifested against it, there was the further disadvantage of greatly increased initial cost, whether the high or low-tension system was adopted, and this seemed to militate against it to a greater extent than anything else.

In the past two years there has been an almost complete reversion of feeling on the subject. The American designer has found himself compelled to give the magneto its due, and it seems safe to predict that, within a year or two there will scarcely be a car built that is not thus fitted. The next step is the entire elimination of the battery and coil system, and it is one that Continental builders of light cars have taken some time since, many of the small French cars in particular relying entirely upon a magneto for ignition. An emergency system is always welcome on the car, but where it is a matter of initial cost there appears to be no reason why the magneto should not be the one system selected.

A. A. A. CONVENTION SPLENDIDLY SUCCESSFUL

BUFFALO, July 7.—The first Legislative and Good Roads Convention of the American Automobile Association was called to order by President Hotchkiss at 10 o'clock this morning in Concert Hall, in the Teck Theater Building. Mr. Hotchkiss spoke briefly in welcoming the delegates, and closed by reading an extract from an address of President Roosevelt, delivered at the International Good Roads Congress in 1903, and which had been sent to Mr. Hotchkiss by the President.

Mayor Adam delivered the keys of the city to the convention in an address, in which he paid due tribute to this great city of Northwestern New York, and then spoke briefly of this great work of making bad roads into smooth and beautiful highways. He said, in part:

Speed is a superfluity. Good roads are a necessity. Success in obtaining good roads must rest upon the character of the road to success. I mean the roads of fairness, justice, perseverance and cooperation. These are the highways that lead to ideal good roads. not for the automobility alone, not for the man with the elxsixty, but also for the man with the hand cart. The ueere of roads must be kindly considerate one to another. It should not be a capital crime for a chicken to desire to cross a road. Who knows but deliberate cows are sent especially to test alike our patience and our emergency brake. Gentlemen, you will get the fullest measure of your rights by observing in the fullest measure the rights of others. Let ua have cooperation, let the citiee work with the towns, the automobilist with the farmer. the cyclist with the pedestrian, all working together for good roads. Then, instead of pleasure being a bubble, a bubble will be a pleasure.

The convention then went into legislative session, in charge of Charles Thaddeus Terry. In opening this session, Mr. Terry took occasion to criticize sharply existing motor vehicle laws. He characterized them as "intolerable" and "ridiculous." "Intolerable," said Mr. Terry, "because they retard the progress and development of the automobile and greatly lessens its usefulness. Ridiculous because it is hard to conceive how, within the confines of one nation, so many legislative bodies, supposedly made up of the leading men of the Commonwealths, could enact provisions of law on the same subject so divergent and contradictory, and at the same time absolutely without apparent purpose, except to harass and restrict a certain class of citizens."

The first address, "Federal Automobile Legislation," by Hon. W. W. Cocks, Congressman from New York, held special interest, inasmuch as the Congressman introduced a bill, killed in committee, but which it is confidently expected will pass at the next session at a time when automobile interests will have gathered sufficient strength to see it through.

"The Constitutionality of Federal Automobile Legislation" was next discussed by the Hon. Neil Brown, president of the Wisconsin State Automobile Association.

Following W. C. Crosby, chairman of the legislative committee of the Associated Automobile Clubs of New Jersey, gave his hearers food for thought in his comments upon "Unreasonable State Legislation." This address was well seconded by Walter S. Schutz, counsel for the Connecticut State Automobile Association. Mr. Schutz discussed "Uniform State Automobile Legislation," and brought out its advantages.

The open session, under two-minute rule, developed an animated discussion of the subjects touched on hy the speakers.

What Was Done at the Afternoon Session.

This was called the First Good Roads session, held in charge of Robert P. Hooper, chairman of the A. A. A. Good Roads Board. He told of the progress made in securing favorable laws, and expressed the belief that in a few years it would be possible to motor from Boston to San Francisco along improved highways. The following delivered addresses:

James H. McDonald, State Highway Commissioner of Connecticut, and president of the American Road Makers' Association, sounded the keynote of the convention in his address on "Good Roads." Mr. McDonald argued strongly for a system of national highways, built and maintained by the national government, as is commonly done on the Continent.

Frederick Skene, State Engineer and Surveyor of New York, was scheduled for the next period to talk on "The History and Development of State Highways." Mr. Skene was unable to be present, but his paper was read by Deputy State Engineer Frank L. Getman. This paper was of the nature of an historical sketch of the road system of New York. Prior to 1898 the State had taken no steps toward a systematic improvement of its highways by means of State aid. Between 1898 and 1903, the average cost per mile of improved roads was $7,000. Since that time, owing to the increased width and depth of roads and advance in the price of labor and material, the cost has been $9,000 a mile.

Charles J. Glidden, famous automobile globe-circler, took his hearers along for "Seven Minutes on the Roads of the World," in his usual entertaining manner.

"Drainage and Sub-base of Improved Roads" was treated in masterly style by Horatio S. Earle, State Highway Commissioner of Michigan.

Joseph W. Hunter, State Highway Commissioner of Pennsylvania, told the convention of the "Road Improvements in Pennsylvania," a State that in sections challenges the highest skill and genius of the road builder.

"Road Problems in the State of Illinois" was discussed by A. N. Johnson, State Engineer of Illinois.

L. W. Page, chief of the Bureau of Highways, in the Department of Agriculture, Washington, spoke of "The Effect of Automobiles on Macadam Roads." He showed by illustrations how rapidly moving cars raise dust and loosen small particles of the roadway.

The remainder of the afternoon session was taken up by speakers, who spoke as follows: "Road Problems for Automobilists," by R. D. Beman, Deputy State Highway Commissioner of Pennsylvania; "Maintenance of Improved Highways," by James E. Owen, of the Newark (N. J.) Board of Trade; "The Lincoln Way," by Robert B. Caverly, president of the Automobile Club of Washington, D. C., and "Good Roads and Their Benefits," by William L. Raeder, president of the Board of Trade of Wilkes-Barre, Pa.

To-morrow's session promises to be one of unusual interest, and after its close a banquet will be given at the Hotel Iroquois to the invited guests. The program for Wednesday's session is as follows:

10:00 A. M. Second Good Roads Session—In charge of Chairman Hooper.

10:05 A. M. Reports of Committees and action thereon.

ADDRESSES.

"Federal Appropriations for Road Improvement"—Ex-Governor N. J. Batchelder of New Hampshire, Master of the National Grange.

"New York's Highway Code"—Senator Jotham P. Allds, of New York.

"The New Roads Era in Ontario"—A. W. Campbell, Deputy Minister of Public Works, Province of Ontario.

"The Call for Good Roads and the Propriety and Need of Federal Aid"—F. A. Derthick, Master of the Ohio State Grange.

"Special Road Construction"—A. R. Pardington, of New York, General Manager of the Long Island Motor Parkway.

"The Highways of Massachusetts"—Harold Parker, Chairman Massachusetts Highway Commissioners.

"Improvement of Town Roads"—Stephen Ryan, State Road Director in New York.

"Good Roads and Automobiling from the Farmer's Standpoint"—F. N. Godfrey, Master of the New York State Grange.

"Treatment of the Earth Roads."—D. Ward King, of the Missouri State Board of Agriculture.

"Road Problems of the Pacific Coast"—James W. Abbott, of Nevada, late U. S. Highway Commissioner for the Rocky Mountain and Pacific Coast States.

12:30 P. M. Open Session—Under the two minute rule.

1:00 P. M. Adjournment sine die.

2:30 P. M. Practical Demonstrations on the Williamsville, Transit and Clinton Street roads by automobilee, furnished by the Automobile Club of Buffalo to be taken at ths Hotel Iroquois.

The racing war comes up for much discussion in this gathering of automobilists from all over the country. The pretensions of the New York club to control the sport of racing in this country are generally laughted at. No one seems to care a cent what action the European clubs take.

How the Delegates Gathered at Buffalo.

BUFFALO, July 6.—Delegates to the Legislative and the Good Roads Convention of the American Automobile Association began to make their appearance Sunday, and to-day they are pouring into the city by railroad, steamship, automobile, and trolley. Buffalo is on the eve of the greatest convention of its kind in history, and Buffalo is rising to the occasion with her accustomed vigorous hospitality.

Those arriving are registered promptly at the headquarters of the A. A. A. at the Iroquois Hotel, by Secretary Frederick H. Elliott and his staff of assistants. Those arriving by train and steamship are met at station or docks by members of the reception committee in automobiles and taken to their hotels. Badges and booklets containing the program of the convention and coupon tickets for the various entertainments planned by the entertainment committee are distributed among the visitors as they are registered. The Ellicott Club and Country Club have extended their hospitality to members of the convention while in the city. John L. Clawson is chairman of the entertainment committee and A. H. Knoll chairman of the reception committee in charge of the entertainment of the delegates and visitirs.

Prominent among the first arrivals were: James W. Abbott, of Nevada, United States Highway Commissioner of the Rocky Mountain and Pacific Coast States; Joseph W. Hunter, Highway Commissioner of Pennsylvania, and Stephen Ryan, State Road Director of New York, and H. M. Swetland, of THE AUTOMOBILE. Accompanied by County Engineer George C. Diehl, chairman of the committee on practical demonstrations, they have already inspected the various exhibits of road construction and dust prevention just outside the city.

Robert P. Hooper, of Philadelphia, chairman of the Good Roads Board of the A. A. A., and U. S. Dandurand, vice-president of the Automobile Club of Canada, are also here to attend the convention.

Not only delegates, but visitors as well, have motored to the convention. More than fifty cars have arrived from points in Pennsylvania and Ohio, while touring parties from East and South are coming into the city in large numbers.

The city is a flame of color. Flags and bunting hang everywhere in honor of the thousands of visitors, and while the national colors predominate, the A. A. A. flags, emblazoned with the convention name, proclaim everywhere the object of the gathering. Every automobile in the city carries these pennants.

Three hundred cars will be required on Thursday to convey delegates and guests attending the good roads convention to different points in and near this city, when exhibitions of modern road making and demonstrations of dust-laying methods will consume several hours of the convention's time. As noted on the program, this outdoor feature is a stated part of the convention proper, and it bids fair to be one of the most instructive periods, notwithstanding the intense heat.

Cars will start from headquarters at the Iroquois, transporting the delegates by a long and devious route to, successively: a dust alleviation experiment; a road machine exhibit, showing improved types of apparatii used in the construction and maintenance of good highways; a tarvia treated highway; a Kentucky rock asphalt section; practical demonstrations of vitoviaby road building (one mile being treated); a mile of highway treated with asphaltolene; a section of macadam construction, and as a windup an inspection of a brick country road now under construction.

George C. Diehl, chairman of the committee on practical road demonstration, prepared his part of the program with all attention to detail, and the outdoor session of the convention proved a source of practical education to every motorist and highway commissioner in attendance.

Chairman Diehl laid his plans with care, and through various channels succeeded in developing live interest in over 900 towns in the State by urging the attendance of representative supervisors, town clerks, and justices of the peace. In doing this he outlined the scope and objects of the convention. The crowd of visitors attest the success attendant upon his efforts.

The United States Government is represented by Logan Waller Page, director of the Offices of National Public Roads. Mr. Page was educated in engineering work as applied to roads in Harvard University and later in French colleges.

Governor Hughes has appointed the following delegates to represent the State of New York at the convention: Senators Jotham P. Allds, Henry Hill, George A. Davis, William H. Hotchkiss, and Arthur Warren. This is an emphatic recognition and endorsement of the Good Roads Convention accorded by the state through the presence of its representatives. Other delegates and members of the convention who have arrived are:

E. L. Powers, New York, secretary of the American Road Makers' Association; Will S. Blair, Indianapolis, secretary of the N. P. Manufacturers' Association, appointed as delegate by Governor Hanley of Indiana; Fred N. Root, Kalamazoo, Mich.; Curtis Hill, Columbia, Mo., State Highway Engineer; Pike Campbell, Louisville, Ky., Louisville Automobile Club; Roy F. Britton, St. Louis, trsasurer Missouri State Automobile Aesociation; L. M. Bradley, New York, manager publicity department, American Motor Car Manufacturere' Association; W. H. Chase, Boston, chairman Good Roads Commiselon, Massachusetts Stats Automobile Association; Mark Aitken; A. E. Lerch; and H. E. Marsh, Springfield, Mass., Automobils Club of Springfield; W. H. Heath, Adam Byerly, J. B. Billick, Greenock, Pa.; James C. Wonders, State Highway Department, Ohio; D. W. Seitz, Columbus, O.; Senator J. P. Allds; James T. Drought, secretary Milwaukee Automobils Club and eecrstary Wisconein State Automobile Association; Neal Brown, president Wisconsin State Automobile Association; Frank E. Bogardue, New York, County Engineer; L. W. Page, Washington, D. C.; Mrs. J. H. MacDonald and daughter, Hartford, Conn.; Robert P. Hooper, Philadelphia, chairman of the Good Roads Board of ths A. A. A.; S. Boyer Davis, Philadelphia; Frank G. Webb, Brooklyn; Alfred Wilmarth, Brooklyn; George B. Baird and L. H. Townssnd, Oneonta, N. Y.; W. H. Hager, Cleveland; Frederick H. Huston, Columbus, O.; Arthur L. Stark, Elyria, O.; Asa Goddard, Clsveland; W. C. Thoma, Pittsburg; Dr. E. C. Wagner, Wilkss-Barre, Pa.; Frank H. Nutt, Kokomo, Ind.; Crow Cooley, Minneapolis; C. Gordon Neff, Cincinnati, O.; Charles P. Price, Malden, Mass.; John R. Rabiln, Boston; Lynn White, Chicago; William J. Donnelly, S. D. Bartlett, Edwin H. Lewis and L. E. French of ths Quaker City Motor Club, Philadelpbia; John P. Coghlin, Worcester, Mass.; A. D. Convsrse, Wincheden, Mass.; and John S. G. Dsmont, Bryn Mawr, Pa.

President Hotchkiss Emphasizes Convention's Importance.

That this good roads movement is close to the hearts of automobile owners is demonstrated by the presence of delegates from nearly onc hundred automobile clubs; also by the important places assigned on the program to men high in the councils of state automobile associations. President Hotchkiss, of the American Automobile Association, said in conversation with several newspaper men:

"It is particularly noticeahle that in this convention—which was originally called by the American Automobile Association—are cooperating the National Grange, which at present, with the backing of a million members, is advocating a fifty-million-dollar appropriation from the federal government, througb the Currier Bill, and the American Roadmakers' Association, which, repressnting, as it does, the state highway commissioners and sngineers, ae weil as a vsry large number of road experts throughout ths country, ie particularly interested in securing state aid for good roads.

"Thus, the three great bodies which are most vitally interested in the good roads movement are meeting together at Buffalo, and their meeting will doubtless result in some sort of an understanding that will lead to similar conventione annually, growing larger and more important, until practically all of ths states and the federal government are actively at work, through appropriation, plan and actual construction, in building good roads. Already the city of Cincinnati, through its Convention League, has taken action urging that the next gathering be held in that city."

BUFFALO, July 7.—On this, the eve of the fifth annual contest of the American Automobile Association for the Glidden trophy, the usual condition of excitement reigns; competitors are hourly arriving from the dozen or more factories represented in the list of contestants. Press representatives from the different metropolitan journals are reaching the city on every incoming train, representatives from the several American tire factories have already arrived, and, in short, from all sections of the land are special envoys, representatives of the different phases and departments of the motor industry, all going to swell the great caravan that will, from July 9 to 23, meander its way over 1,670 miles of New England roads under the name of the Fifth Annual Reliability Tour of the A. A. A.

A mile down Main street from the Iroquois Hotel is the Teck Theater Building, on the second floor of which are located the different managers to whom the contestants will look for the successful conduct of the contest. Chairman Frank B. Hower, of the A. A. A. Touring Board, in shirt sleeves, superintends the entire situation; Dai H. Lewis is the *route à confetti* encyclopedia; E. L. Ferguson is busied with the final arrangement of the entries, as well as bringing together the data and forms necessary for the daily dispatch and reception of the cars; Mortimer Reeves has his hands full with the rôle of assistant pilot duties, coupled with those of nightly garaging or parking the cars; F. D. Stadham, chief of the observer brigade, is rapidly perfecting his outline plan for the placing of impartial observers on the cars each day, as well as the permutating of them so that no observer rides on the same make of car, or on a car of the same team, or on a car handled by the same firm as nominated him; H. D. Herr is busied with the hotel accommodations, which include the systematizing of the work under Cook control, as well as the explaining of it to the different competitors; Arthur N. Jervis, the publicity end, is playing the rôle of a complete press room; Nathan Lazarnick, the official photographer, has everything necessary in the line of plates and films; Messrs. Conklin and Carroll, the night watchers, have had their instructions and David E. Hoag, the official physician of the route, has all his plans perfected. It only remains for the cars, drivers and observers to do their parts during the long twelve days of the drive.

Numbers Not So Great—Conditions More Strenuous.

Statistically considered, the Glidden-Hower Tours are not so big as a year ago, but the loss in numbers is more than compensated for because of the fact that those cars entering have done so in spite of the $200 entry fee, in spite of the fact that impartial observers will be carried on each car, and also despite the fact that this year's tour leads through a generally mountainous and hilly district, the roads through which are largely composed of clay and gravel, which, if weather conditions are favorable, will make easy going, but if rains are frequent will result in the hardest kind of work for the contestants. Already twenty-seven Glidden Trophy cars are waiting to be dispatched by Ferguson Thursday morning, all of which will compete in clubs for tbe Glidden Trophy, the twenty-seven being divided among nine clubs, three cars constituting a team, the division being as follows:

Automobile Club of Buffalo, 1st team:
Car No. 1, Pierce Arrow, Charles Clifton.
Car No. 2, Pierce Arrow, Charles Clifton.
Car No. 3, Pierce Arrow, James McGuire.

Automobile Club of Buffalo, 2d team:
No. 4, Reo, R. M. Owen.
No. 8, Premier, R. M. Owen.
No. 9, Premier, H. O. Smith.

Columbus Automobile Club:
No. 5, Peerless, E. H. Parkhurst.
No. 6, Peerless, E. H. Parkhurst.
No. 7, Peerless, E. H. Parkhurst.

Rochester Automobile Club, 1st team:
No. 10, Gaeth, Paul Gaeth.
No. 11, Thomas, Gus G. Buse.
No. 32, Selden, R. H. Solomons.

Rochester Automobile Club, 2d team:
No. 24, Studebaker, E. V. Stratton.
No. 25, Studebaker, E. V. Stratton.
No. 26, Studebaker, E. V. Stratton.

Automobile Club of Syracuse:
No. 12, Franklin, H. H. Franklin.
No. 13, Franklin, John Wilkinson.
No. 14, Franklin, F. H. Stillwell.

Chicago Motor Club:
No. 19, Haynes, Frank H. Nutt.
No. 20, Haynes, Loring Wagoner.
No. 35, Oldsmobile, F. O. Smith.

Bay State Automobile Association:
No. 21, Marmon, Frank E. Wing.
No. 22, Marmon, W. C. Marmon.
No. 23, Marmon, W. C. Marmon.

Cleveland Automobile Club:
No. 29, Garford, A. R. Davis.
No. 30, Garford, A. R. Davis.
No. 31, Garford, A. R. Davis.

It is up to these nine teams to fight out the contest as to which shall be the proud possessor of the Glidden Trophy for the 1908-1909 season. It is apparent from the status of these nine teams that the winner for 1908 will be more of a factory than motor club proposition. Of the nine teams six represent as many individual factories, the makers having this representation being Pierce, Peerless, Studebaker, Franklin, Marmon and Garford. The three mixed teams are the Haynes and Oldsmobile combination in the Chicago Motor Club, the Selden-Gaeth-Thomas combination constituting one of the Rochester clubs, and the two-to-one Premier-Reo team forming the second Buffalo club. Two automobile clubs, namely, the Buffalo and Rochester, have entered two teams, whereas a year ago the Buffalo club entered but one team, which was a combination of varied factory interests. It is expected on every hand that this one factory team situation will add greatly to the interest in the tour, and should one of these teams win it the factory can stand on the ground that its car won the Glidden Trophy, which was an impossibility under the conditions of a year ago. On the other hand, with the three remaining clubs that have mixed teams a different situation rules. Should the combination Rochester team win, Selden, Gaeth and Thomas will each have a third interest in the big trophy; if the Chicago Motor Club carries the winning colors, Haynes and Oldsmobile will divide on a two-third and one-third basis, and should the second Buffalo team be the final winner, R. N. Owen, the entrant of two cars, will have to look after tbe division of honors between Premier and Reo ranks.

A year ago forty-six cars started out to strive for the trophy, and although this year's number shows a reduction of nineteen it is agreed on all hands that interest tbis year will be more than double that in the event of a year ago.

As heretofore, the struggle for the Hower Trophy will be an individual affair, this trophy going to the car having the highest merit marks at the completion. The trophy will be contested for by fourteen runabouts as against thirteen in 1907; of these fourteen two are Pierce Arrows, three Stoddard-Daytons, three Overlands and one each of Franklin, Premier, Gearless, Moline, Reo and Blomstrom.

In addition to this grand total of forty-one in the Glidden-Hower phase of the contest are five entrants that are contesting solely for Glidden certificates, the main reason for these competing under this classification being the impossibility of their getting in a club team. This list includes two Stevens-Duryeas, two Oaklands and a Rainier, the last to be driven by Mrs. Cuneo, who has piloted cars successfully during the previous Glidden tours.

In addition are three non-contesting cars, consisting of a Studebaker *Motor Age* Press car, a Packard Press car and an Oldsmobile entered by C. H. Foster and designated the Gabriel Horn car. Added to these are four official cars, No. 99, Chairman Hower's Pierce Arrow; No. 98, Dai H. Lewis' Premier pilot; No. 97, Mortimer Reeves' Reo as assistant pilot, and No. 96, the Packard Red Cross, under the official direction of Dr. Hoag.

Recapitulating, we have the analysis and relative strength of the 1908 and 1907 Gliddens as follows:

	1907	1908
Glidden Trophy	46	27
Hower Trophy	13	14
Glidden certificates	4	5
Non-contestants	6	3
Officials	5	4
Total	74	53

The entry fees for 1907 at $100 a car aggregated $7,650 and for 1908 at $200 a machine $9,800.

Carrying Out the Preliminary Inspection.

In one regard the change of heart evidenced on all sides by the management in respect to the carefulness of the tour is well exemplified by the inspection of all cars and extra parts carried by them all on Wednesday morning, July 8, at 9 A.M. At this hour all of the contesting cars must present themselves at the official parking place, 757 Main street, where they will be taken over by the Ferguson-Reeves combination. After a cursory examination to insure that nothing but stock models are competing, the program will pass on to the checking-in of the regular spare parts, such as valves, valve springs and other extras regularly supplied by manufacturers at listed prices. The committee has ready heavy canvas bags similar to those employed for carrying mail, in which these parts will be placed and sealed therein by wire with lead seals, an inventory of the parts therein being retained by the committee. In another canvas bag of more than double the size, but of the same design, will be put in all the extra spare parts that the contestants take along, by extra spare parts being meant those not regularly supplied with the car at the list price. An inventory of these parts will be taken and kept by the committee, so that a check-up system can be used periodically with the contents of the different bags. In case contestants carry extra large parts, like springs or steering knuckle tie rods, which cannot be carried in the extra spare part bag, a suitable sealing of these in the car will be accomplished. Tools will be left free, to be carried in their regular boxes, and any use whatever may be made of them on the road without penalty, providing the car maintains its time schedule; the penalization system deals only with the use of new parts which are carried in the regular or extra bags, and the penalty for the use of either is at the rate of one point per dollar, the parts being listed at their regular factory prices. This rule is the same as a year ago, but will work out much better to the different clubs because all of the teams are constituted of three cars, so that the penalty credit to each of the nine clubs will be the same for the same breakage, providing the price of replacement is the same. Last year, owing to the different numbers and the teams, one team of ten cars received but one-tenth point, whereas a similar breakage in another team of three gave the team a penalty of a third point. Any contestant that has to make use of spare parts not carried from the start of the tour and inventoried officially, will be disqualified.

Aspect of the Observer Situation.

Before the completion of the tour the observer proposition will prove the crux of the situation, because on the impartial selection of the winning clubs depends the veracity and faithful performance of duty of these arbiters of the situation. In order that these twenty-seven observers for the Glidden and fourteen for the Hower may start as well fitted as possible for their duties special cards have been issued, on which they will record their daily reports

Scenic Part of the Route Is Very Picturesque.

To Pathfinder and Chief Pilot Dai H. Lewis belongs the honor of the detail selection of the scenic route which the Glidden tourists for this year will follow. While it is essentially an Eastern tour, starting from Buffalo and circling through the New England States to Saratoga Springs, a total distance of 1,669.7 miles, it offers as varied road conditions, as exceptional scenic conditions and as good all-around touring conditions as would be possible to find. During the twelve days of the trip no less than six of the Eastern mountain ranges are traversed; on the third day, on the Pittsburg-Bedford leg of the trip, the Alleghenies are crossed; in the Milford-Albany run, on July 16, the Catskills are encountered; the run from Albany to Boston passes through the Berkshire Hills; two days of the run, namely, Poland Springs to Rangeley and Rangeley to Bethlehem, the White Mountains are traversed, and during the last day's jaunt the Green Mountains are encountered and the wind up made at Saratoga Springs on the foothills of the Adirondacks. A conservative estimate places the mountain and hill touring at 40 per cent. of the trip. There are few of the long, level runs that featured last year's run from Cleveland all the way to Canton and from Baltimore to New York. The first day's run, Buffalo to Cambridge Springs, is over the old St. Louis tour route to Erie, which is a rolling ninety-six miles jaunt, but from Erie to Cambridge Springs is hilly work. The second day's run, from Cambridge Springs to Pittsburg, is hilly, with a little mountain work approaching the Iron City. The third day's run, from Pittsburg to Bedford Springs, is the hardest one of the tour and is not over the same route followed between these places by the Gliddenites a year ago. The route lies further north and leads through more picturesque mountain country and offers extreme touring conditions. The Bedford-Harrisburg run is an easy one, as is the Harrisburg-Philadelphia stage. From Philadelphia to Milford is the most level stage.

Ten Teams Instead of Nine Will Contest.

BUFFALO, July 8.—Thirty cars are now contesting for the Glidden trophy, making 10 teams of three each, the tenth team being made up this morning and consisting of two Oakland cars and Mrs. Cuneo's Rainier, the three going under the color of the Chicago Motor Club, making the second team for this club. This changes the Glidden status in that there remain but two cars running for Glidden certificates, namely, the Stevens-Duryeas. Three extra non-contesting cars have been taken on, making in all 56 cars that will leave Buffalo at 10 o'clock to-day on the first day's run to Cambridge Springs. The three added machines are a second Studebaker press car, a Diamond tired machine, entered by N. E. Oliver, and a Goodrich tired car, entered by W. O. Rutherford. The registration of the 56 cars is Glidden trophy 30, Glidden certificates 2, Hower trophy 14, non-contestants 6, official cars 4, total 56.

"June Bug," with Aviator Curtiss, Winning "The Scientific American" Prize at Hammondsport, N. Y.

"JUNE BUG" MAKES RECORD FLIGHT CAPTURING $2,500 PRIZE

HAMMONDSPORT, N. Y., July 4.—Persistent effort on the part of the Aerial Experiment Association, headed by Alexander Graham Bell, has finally succeeded in landing the *Scientific American* prize of $2,500 for a straightaway flight of a kilometer. This was accomplished by the *June Bug* this evening, the third machine to be built and tried out by the association. The aviator was G. H. Curtiss, who made more than a mile straightaway, then turning and landing easily, the whole flight taking 1:42 1-2. The flight was made under the auspices of the Aero Club of America.

The *Red Wing* was the first machine to be built, under the supervision of Lieutenant Selfridge. On March 12, 1908, it made its first trial, with F. W. Baldwin as aviator. Starting from the ice after a short run, it covered nearly 319 feet. Instead of repairing the *Red Wing*, the association started to build the *White Wing*, under the supervision of F. W. Baldwin.

On May 22, G. H. Curtiss accomplished 1,017 feet in nineteen seconds, the longest public flight up to the time that had ever been made in America. On May 23, J. A. D. McCurdy essayed to make the flight, and he accomplished 600 feet. The landing proved disastrous. Shortly after the *June Bug* was built, all three being alike.

On June 21 the first flights were made, the first of 456 feet at 28 miles an hour, the second at 411 feet at 31 1-2 miles an hour, and the third at 1,266 feet in 25 seconds, or at the rate of 34 miles an hour. The next flight was of 2,175 feet, taking 41 seconds, 36 miles an hour. On the same day Mr. Curtiss accomplished the record flight of 3,420 feet in 60 seconds.

BALLOON RACE PROVES EXCITING AND MAKES NEW RECORD

CHICAGO, July 5.—By landing at West Sheffield, Quebec, about 60 miles east of Montreal, the *Fielding-San Antonia*, after a 24-hour flight of 895 miles, proved to be the winner of the balloon race held by the Chicago Aeronautic Club. Of the nine big globes that started from the Windy City yesterday afternoon, the one to make the closest approach to Dr. Fielding's flight was the *Illinois*, which landed at Picton, Ont., with 545 miles to its credit, while the *Chicago*, C. A. Coey's monster gas bag, which is larger by one-third than anything ever seen in this country, got as far as Atwood, Ont., covering 522 miles. Dr. Fielding claims to have exceeded the *Pammern's* flight of 876 miles.

Judging from the string of mishaps that befell the competitors, proximity to a large body of water is not a favorable element in the characteristics of a starting place for a balloon race, so that Chicago proved not to be well situated in this respect. The cold air from Lake Michigan proved detrimental to the hopes of the majority of the contestants by greatly contracting the contents of the huge bags and came near ending fatally for two of them, the occupants of the *Ville de Dieppe*, the French entrant. Col. A. E. Mueller was its pilot, assisted by George Schoenck, a fifteen-year-old boy. It was said that the balloon was in no condition to undertake such a test, but its pilot determined to start anyway. The wind carried it over the lake, and the drop in temperature caused it to fall to the surface, compelling the aeronauts to sacrifice everything in the basket, but despite this the balloon continued to drag along the water and threatened to be forced under by the wind at any moment. After having skimmed along in this manner for about ten miles, a warm current of air was struck and the balloon immediately shot up several thousand feet. Without instruments, food or clothing, Mueller came to the ground near Benton Harbor, Mich.

The cold air also came near dropping the *Illinois* into the lake, and so much ballast had to be sacrificed that its chances were spoiled, while the *American*, which made 402 miles to Carsonville, Ont., also suffered from lack of ballast, and had to sacrifice gas. The *King Edward*, Canada's representative, also took to the water once or twice, and had scarcely anything portable left after crossing Lake Michigan, while the *Cincinnati's* occupants descended to assist the *Ville de Dieppe*. The competitors finished as follows:

Balloon.	Place of Descent.	Distance. Miles.	Time. H.M.
Fielding-San Antonio,	West Sheffield, Quebec	895	23 15
Illinois,	Picton, Ontario	545	16 34
Chicago,	Atwood, Ontario	522	14 48
American,	Carsonville, Mich.	402	13 40
United States,	Pinkerton Station, Ontario	388	11 42
Cincinnati,	Covert, Mich	350	9 33
King Edward,	Port Huron, Mich	335	8 03
Columbia,	Clinton, Ontario	276	8 26
Ville de Dieppe,	Lake Michigan	65	6 02

MIDSUMMER DOINGS OF THE AUTO CLUBS

MEDIA CLUB HELPS GOOD ROADS ALONG.

MEDIA, PA., July 6.—The Automobile Club of Delaware County has advised the road supervisors of Springfield township that it is prepared to turn over to them the sum of $1,000 as soon as operations are begun in the repair of the old Baltimore pike. The club, although less than 20 months old, has nearly 200 members and its donations this year to the good roads cause total nearly $1,200.

The club has sent text-books on the construction and maintenance of roads to every commissioner, supervisor and borough council in the county. In a letter accompanying these text-books attention is called to the regulation forbidding the placing of loose stones in the road for traffic to grind down, and that failure to use a binder and to roll render supervisors liable to prosecution, something not commonly known heretofore.

The club is preparing to combat the speeding practice. Warning signs will be erected along the Chester and other pikes, and in a circular letter to members anent this subject, President Weeks, among other things, says:

We have agreed to break up speeding in the boroughs. In some places we are to furnish signs, others are satisfied with our guarantee that we can stop it by this method: First, a warning letter to all our members; second, that we establish our own traps on an 18-mile basis and send our officers from place to place and prosecute every man—member or not—who exceeds 18 miles in the towns. By this plan we can maintain a rational, sane use of the roads through boroughs; otherwise they will hold us to the 10-mile limit.

BOSTON CLUB'S ANNUAL OUTING ABANDONED.

BOSTON, July 6.—The annual outing of the Bay State Automobile Association, which was scheduled to have been held on the 4th and 6th, at Newcastle, N. H., was abandoned owing to lack of interest. The touring committee was late in getting its plans made for the trip and consequently many members had already made arrangements for private trips over the holiday and Sunday. Furthermore several members are leaving to-morrow for Buffalo.

The touring committee does not propose to be caught the same way in its fall event and announcement has just been made that in September the association will conduct a club run and twenty-four hours endurance contest from Boston to the White mountains and return. The committeemen have a plan under consideration which they believe will interest private owners, dealers and manufacturers.

About the middle of the month the association will move into its new quarters in the Carleton Hotel on Boylston street. It will there welcome the Glidden tourists who are to spend Saturday and Sunday, July 17 and 18, in Boston. Extensive plans are being made for the entertainment of the visitors. They include a trip to Nantasket by harbor boat on Saturday, a dinner Saturday night, another harbor trip Sunday and an outing to Lexington, Concord and other points of interest.

COLUMBUS CLUB GIVES ORPHANS A TREAT.

COLUMBUS, O., July 2.—The Automobile Club of Columbus gave the orphans of the city an outing at the East End Country Club on June 26. Through the courtesy of practically all owners of machines here they were enabled to give a full day's enjoyment to about 1,500 little ones. The committee in charge of the outing was made up of Roy D. Williams, Dr. O. H. Sellenings, Dr. George P. Stephenson and several other members who served as directors of the entertainment features.

The Automobile Club of Columbus was reorganized in April and since then a consistent effort has resulted in the establishment of the club on a firm basis and at this time the membership is strong and growing. Club runs are given at intervals and so far they have proved successful in all respects.

MONTREAL CLUB MAKES APPEAL TO DRIVERS.

MONTREAL, QUE., July 6.—At a recent meeting of the Automobile Club of Canada, held this week, complaints were received regarding the non-observance of the rules of the road by both motorists and drivers of vehicles. After a thorough discussion of the matter the directors decided to make an appeal to drivers to give the matter their attention. Many drivers in Montreal make a habit of passing street cars on the side on which people are getting out. The directors deplore the action of certain motorists who offended in this manner in going to and from Blue Bonnets during the recent meet of the Montreal Jockey Club, which attracted a very large crowd.

A suggestion that permission be applied for to use automobiles on Mount Royal was then discussed but was not adopted. It was decided to place route signs and cautions on the road between Montreal and Rouse's Point. This will be a great benefit to those who frequently run from Montreal to New York. Part of the road between New York and Rouse's Point has already been placarded for the tourist's information.

It was also decided at the meeting that the club should take the initiative in abating the dust nuisance on the Longue Point Road. A new composition of oil to lay the dust will be used. The members of the automobile club hope that in the near future they may be able to interest the Turnpike company in the matter, but until then the club will bear the expense.

HARTFORD CLUB ADOPTS OFFICIAL EMBLEM.

HARTFORD, CONN., July 6.—The Automobile Club of Hartford has adopted a club emblem which is to be carried on the radiator spout. It is, in fact, the club button enlarged. The design is that of a spoked wheel and tire. The words "Automobile Club of Hartford, Hartford, Conn.," are in a circle on the tire. The background is brass with blue enamel. The emblem can be readily detached if desired and applied to the dash. After much discussion it was thought best for the sake of individuality to adopt something that could be carried on top of the cooler spout and yet be ornamental.

The club is erecting durable road signs for the convenience of tourists covering all roads out of the city, up to a distance of 25 miles. They contain information concerning distances, curves, grade crossings, and bad roads. The signs are made from heavy gauge strip steel, exhibiting an arrow. Distance is indicated by the point—the name of the town is on the shaft and the club's address on the tail. Other information is shown on the body of the board. The color scheme is blue and old gold, the recently adopted colors of the Hartford Automobile Club. The signs are being erected on wooden posts.

QUAKERS TO ENTERTAIN A. A. A. TOURISTS.

PHILADELPHIA, July 6.—The Quaker City Motor Club is making elaborate preparations for the entertainment of the Glidden tourists who are due here on the 14th. The club has secured permission to use the city hall plaza as a parking place for the tourists' cars during their overnight stay here and a strong guard of police will see that they are not molested during that time. The stag smoker to be held in the ballroom of the Hotel Walton promises an entertainment for the tourists of more than ordinary excellence.

The club has posted a notice warning members and others that Stenton avenue, between Germantown and Chestnut Hill is being patrolled by time squads. This broad level highway is on the direct route between Philadelphia, Reading and Harrisburg, and proves a dire temptation to the speed-inclined. A number of arrests have been made and so the warning advises, "go slow and toot."

LOCOMOTIVE CO.'S CONTRACT TERMINATED.

PROVIDENCE, R. I., July 6.—On July 1, the three-year agreement of the American Locomotive Automobile Company with the builders of the Berliet, at Lyons, expired by limitation, and the Providence makers will henceforth discontinue the use of the word Berliet altogether. In this connection an important announcement is made to the effect that the separate existence of the American Locomotive Automobile Company has also come to an end and that it is now part of the parent company, the American Locomotive Company. Concerning these changes, Vice-President Ball, of the latter said: "The American Locomotive Company, having acquired all of the stock of the American Locomotive Automobile Company, has, for corporate reasons, absorbed that subsidiary company with several others which have heretofore led separate existences. The policy, therefore, is not one affecting the automobile company solely. The automobile business will be continued at the works at Providence, in the garage at 1886 Broadway, New York, and in the agencies in the various cities in the country on a larger scale than ever. Besides continuing to make, under the Locomotive name, its line of touring cars, the company has in prospect a business of considerable proportions in the production of cabs and trucks. There will be no radical change of design in the cars with the dropping of the name Berliet, but it will be possible to make certain modifications of the French design that are desirable for American use. The personnel of the organization of the automobile department will remain unchanged, James Joyce, assisted by R. B. Van Dyke, having charge of the New York offices; Charles E. Davis continuing as superintendent of the factory, and B. D. Gray as designer and chief engineer of the company.

FORD TO BUILD MAMMOTH FACTORY.

DETROIT, July 6.—As a fitting commemoration of its fifth anniversary, as it was organized June 16, 1903, comes the announcement by the Ford Company that it will immediately begin the work of erecting what will easily be the largest automobile plant in this country, if not in the world. The main building will be 865 feet long by 75 feet wide, four stories high—the largest building under one roof in the State of Michigan. It will be built throughout with reinforced concrete, glass and steel—fireproof in every particular.

The total floor space of this building is 258,000 square feet—a mile of floor fifty feet wide—six acres of floor space in the one building. It will contain 13,400,000 cubic feet of space. The glass in the windows totals 52,453 square feet—enough to make a strip one foot wide ten miles long. For heating the building, 58,000 feet—eleven miles—of pipe are required. The Ford Motor Company owns sixty acres of land and the complete plans contemplate utilizing the entire tract for the new plant. It is the old Highland Park race track property, and includes a mile track, which will be used for testing. When finished—and the work is to be rushed through—every part of the Ford cars will be manufactured there, from bolts to cushions, giving employment to 5,000 men, and an output of 500 complete automobiles per day. Alfred Kahn, well known as the architect of the Packard, the Thomas Buffalo and Detroit, the Garford and the Pierce plants, has been selected for the new Ford factory, and it goes without saying that in the arrangement of its facilities for the rapid manufacture of parts and the assembly of cars, the new plant will be a model of its kind.

AKRON GETS AUTO FIRE FIGHTING MACHINES.

AKRON, O., July 6.—After a trip to New York, Rochester, N. Y., Boston, Fall River and Springfield, Mass., Fire Chief John T. Mertz and the members of the board of safety, E. C. Housel and C. C. Benner, decided that self-propelled fire apparatus should be used in this city as soon as it could be introduced without throwing out present satisfactory apparatus. As a result announcement was made that bids would be received July 1 for three auto combination hose trucks. Mr. Housel stated that in time autos will take the place of horses in all of the fire companies of the city—seven stations in all. "The hills of the city will constitute no hindrance," he stated, basing his decision on what he had seen in Eastern cities.

The specifications for the new auto trucks provide that they be of 40 horsepower and have a speed of 25 miles an hour on the level and 15 miles up a ten per cent. grade. Each machine is to have four cylinders, air-cooled, gasoline power and vertical pipes. The wagons will carry one 40-gallon chemical copper tank across the front of tbe hose body, 250 feet of chemical hose and a capacity for 1,000 feet of 2 1-2-inch cotton fore hose. One of the wagons will carry a 20-foot extension ladder and the other two 20-foot extension ladders. They will also be fully equipped with axes and other similar apparatus, so that there will be nothing lacking for the business of fire-fighting when the power-driven machines reach the scene of action.

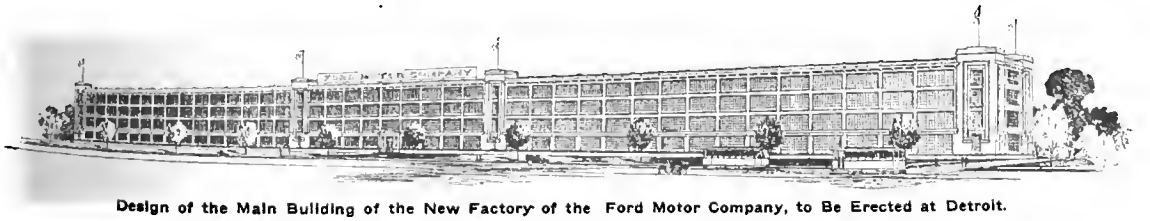
Akron claims to be the first city in the entire country to have an automobile police patrol and expects to be among the pioneers in installing "horseless" fire apparatus.

MAXWELLS NOT TO ENTER A. A. A. TOUR.

This year's A. A. A. tour will perhaps be the first one in which the Maxwell-Briscoe Motor Company will not take part. "From its inception we have been enthusiastic supporters of the Glidden tour," said Benjamin Briscoe, "not from any altruistic motive, but because the tour gave us a chance to demonstrate the efficiency of a moderate-powered and moderate-priced car as compared to the performance of the high-powered and more costly vehicle. And, as a rule, when it came to counting the heads of successful competitors in Glidden tours, Maxwell cars have been found well in the front rank. But the decision of the touring committees to place a handicap upon the lower-priced cars may be well enough for some, but is all wrong for Maxwells. It is just possible that we shall have a sort of Glidden tour of our own, with enough extra strenuosity thrown in to prove that Maxwell cars, in spite of their low price, or perhaps because of it, require no handicap."

SETTLING THE OLD AEROCAR TANGLE.

DETROIT, July 6.—Creditors of the defunct Aerocar Company, against which bankruptcy proceedings were recently instituted, are proceeding against A. Y. Malcomson, ex-president of the concern, for a settlement. He held $204,000 worth of the stock of the company and has filed a claim against it for money advanced amounting to $92,000. The liabilities of the company total $300,000 and the sale of its plant only brought $100,000, so that if Malcomson's claim is allowed, there will be practically nothing for the creditors. Action has accordingly been begun to compel him to pay the difference between the face value of the stock he holds and what he actually paid for it.



Design of the Main Building of the New Factory of the Ford Motor Company, to Be Erected at Detroit.

The Premier Takes Some Real Bears Auto Riding.

SOME UNUSUAL PASSENGERS IN A PREMIER.

It is not often that bears are treated to a ride in an automobile, even though they do happen to be of the trained variety, but this was the case of a Premier "45" car recently, as is strikingly shown by the accompanying photograph. And their bearships seem to be enjoying the situation quite as much as their trainer and the spectators which the unusual sight has attracted to the scene. Fortunately they were well-trained bears and acted like perfect ladies—or gentlemen—should under similar circumstances. Her bearship in the front seat did not attempt to hug the driver, nor did her partner in the tonneau take any-like liberty.

BOSTON GETS THOMAS TAXICAB SERVICE.

Boston, July 6.—Fifty of the new Thomas taxicabs have been received by the Taxi Motor Company, which has its headquarters in the Motor Mart Building, with numerous substations round the city, and W. P. Barnhart, the company's manager is now giving the Boston public the cheap taxicab service that other cities have been enjoying for some time past. The rates are 30 cents for the first half mile and 10 cents for each half mile thereafter, or an equivalent charge of 10 cents for each six minutes waiting. The cabs are the product of the E. R. Thomas Company, Buffalo, and are equipped with French taximeters. It is the intention of the Taxi Motor Company to increase the number of cabs in service to 150 should conditions warrant it.

GOVERNMENT LOSES TIRE IMPORT CASE.

Washington, D. C., July 6.—The government has again appealed in cases of the Auto Import Company, Archer & Company, and Massenat Deroche against the United States, recently decided adversely to the government.

The plaintiffs imported automobiles with tires accompanying that had not been attached in a way to render them capable of immediate use—being interchangeable and might or might not be used on machines with which imported.

The court held that the tires and machines did not togetber constitute an entirety, but were dutiable as though imported independently.

The court further held that in order that merchandise that is distinctively a manufacture of one material, as a rubber automobile tire, shall be classified as a manufacture of another material, as an automobile in chief value of metal, it is necessary that the entire article manufactured should have existed as an assembled entity, so that it would be an invasion for the foreign maker to break the entity into fragments and expect each fragment to be treated as if complete in itself. But where an article has never been assembled abroad, it ought not for tariff purposes to be treated as if it had been so assembled.

POPE COMPANY'S CREDITORS GET DIVIDEND

Hartford, Conn., July 6.—The receivers of the Pope Manufacturing Company will pay 25 per cent. on approved claims, made conditional upon the receiver's receipt of $50,000 for American Wood Block stock, an asset of the Pope Company, and now in hand. The receivers must deposit $65,000 with the Court of Chancery, subject to further order of the court for future partial payment of claims of the lessors of the Chicago property occupied by the Pope Company.

The court further placed the International Trust Company, of Boston, on the same footing with the other creditors. This bank held on deposit certain funds of the Pope Company. It also had outstanding notes against the company. The court refused to sanction the action of the bank in applying the funds on the notes and the receivers will deduct from the trust company's dividend the amount on deposit at time of commencement of the receivership several months ago.

The Pope Company has $400,000 on deposit in Newark. The estimated indebtedness is $1,600,000, and so the $400,000 will just pay the 25 per cent. referred to above. More will be paid late, and it is probable that the company will emerge from its difficulties within the next year or so.

Automobile Engineers Visit Cadillac Plant at the Invitation of H. M. Leland.

Although not originally down on the program of the Third Annual Summer meeting of the Society of Automobile Engineers, held in Detroit the last week in June, one of the most interesting events of the three-day session was the visit to the plant of the Cadillac Motor Car Company, at the urgent invitation of Manager H. M. Leland, who is shown in the accompanying photograph seated with President Fay of the Society in one of the Cadillac cars provided for transportation. This is a runabout and is at the left-hand end of the line. Mr. Leland provided guides for each group of five from the technical staff of the Cadillac plant, so that its entire workings, as well as the details of the foundry situated in another part of Detroit, were thoroughly shown in the course of a few hours.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

To meet the increased demand for finished valve stems and similar work, the Electric Welding Products Company, Cleveland, O., has just installed a grinding department, the equipment consisting of Brown & Sharpe and imported machine grinding tools.

Confidence in the ability of the Truffault-Hartford shock absorbers to save springs is shown by American designers of racing cars, as both the American entries for this classic—the Acme Sextuplet and the Chadwick Great Six stock car will include them in their equipment.

General Manager H. E. Walton, of the Midland Motor Car Company, of Moline, Ill., was in New York the greater part of last week, making a stop in the metropolis in the course of a round of the Midland agencies in the East, including Philadelphia, Boston and other important centers.

To uphold the claims of their basic patents, Spare Motor Wheel of America, Ltd., have filed suit against the Burrowes Screen Company, of Portland, Me., in the United District Court. The spare wheel is coming into extended use in this country and the pioneer firm in this line intends to protect its rights.

The American Motor Car Manufacturers' Association has been advised by Consul W. Maxwell Green, of Hamilton, Bermuda, that the act prohibiting the use of all motor cars in the colony of Bermuda, and to be in force indefinitely, passed both houses of the legislature, and has received the signature of the governor.

The Rambler claims for increased efficiency through the offset crankshaft and straight line drive seem to be substantiated by the twelfth consecutive Rambler hill-climbing victory at Pocono Summit recently, in which a Rambler driven by W. H. Pierce won the event for stock cars of 15.1 to 24 horsepower in 1:16 3-5.

McClay & Black of Los Angeles, a concern that does a large rental business, have kept an interesting record of tire costs and their experience shows that they have been able to average 7,000 miles for every one of the Diamond tires used, despite the fact that they are all on seven-passenger cars and are not given the best of consideration by any means.

A team of three Studebaker Model H, 30-horsepower cars has been entered for the A. A. A. tour through the Rochester Automobile Club. This will be the premier appearance of the Studebaker in the Glidden tour. They will be in charge of Frank Yerger, manager of the Studebaker Philadelphia branch. In addition, another Studebaker will do duty as a press car.

The remarkable performance of the Diamond tire equipment of the Studebaker train of five cars which carried delegates from Chicago to Denver for the Democratic convention is a matter that is arousing no little comment. Every one of the original Diamonds that started on the long run to Denver arrived intact at the latter city, the only delays consisting of four punctures.

As a preliminary try-out the red, white and blue Peerless team of cars entered for the A. A. A. Reliability tour, made the run from Cleveland to Bedford Springs and back last week. The cars will be in charge of Charles H. Burman, who will drive the first with Charles Roth as mechanic; W. C. Straub will pilot the second with Robert Achoff to assist him, while the third will have H. D. Savage at the wheel and J. B. Broch beside him.

The engine of the Acme Vanderbilt racer is now about ready to set up and place on the testing blocks. While work on the engine has been going forward under the direction of Designer Hardy, the frame and running gear is being put together. It is now stated that the car will be on the roads and under stringent road tests by August 1. The question of a driver has not yet been settled, although it is probable that the Acme will be in charge of Jere Price.

At the New York *Globe's* outing held June 28, the Franklin taxicab, loaned by Manager W. S. Jewell and which has just made its appearance in the metropolis, was put to the test. On account of the shortage of cars to transport the 100 employees, it was forced to do double duty, carrying a load of nine. This was done without inconvenience, the run to and from Elmwood, L. I., being made on schedule time. A Franklin truck was also pressed into service, being converted into a modern sightseeing vehicle.

Following their recent successful reliability run, the Indianapolis Automobile Trade Association is planning a similar two-day event. This run will include French Lick, and will be held some time early in the fall. Practically the same rules that governed the one-day run on May 20 will apply to the proposed run. On the latter, 19 out of the 37 cars that started finished with a perfect score. In the two-day run there will probably be a class for trucks, as a 12-passenger Rapid Pullman made the previous run with a perfect score.

Many autoists would be glad to invest in larger tires for their light cars, were it not necessary to also purchase larger wheels. Morgan & Wright have met this demand by bringing out a 31 by 4-inch Universal Dunlop, which fits a 30 by 3 1-2-inch Midgley rim, and a 33 by 4-inch Dunlop tire to fit a 32 by 3 1-2-inch Midgley rim. They are especially recommended for use on the rear wheels. The 40 by 4-inch regular clincher type of M & W make which is being turned out for a few special cars is said to be the largest pneumatic tire made in this country.

While S. Greenwald, of the Greenwald Rubber Company, Buffalo, N. Y., was compounding some rubber in the laboratory of the firm's plant recently, an alcohol lamp exploded and the fire spreading, the offices and factory were completely burned out. Mr. Greenwald was burnt, but not seriously. Considerable loss to the plant was sustained owing to the fact that it was not covered by insurance. The work of rebuilding and remodeling on a larger scale in order to double the company's former output is already under way and deliveries will be made within little more than a week after the fire.

Dr. A. H. Heaton, president of the Sedalia (Mo.) Automobile Club, who started out to show that an automobile tour of Europe could be made in a Ford runabout for $4.68 per day, finds by the expense account of his first week's running that this figure was too high, as the expense per day for the first seven days averages but $3.08, including the cost of an extra inner tube, which added $4.40 to the account. Dr. Heaton speaks enthusiastically of the manner in which the little Ford performs, and adds that the above figures, including putting up at the best hotels, such as the Hotel Beausejour, Lyons, the Grand Hotel Monte Carlo, etc. The biggest item on the week's bill was "hotel, tips and laundry, $25.45," and the next was "gasoline, $12.47."

A prediction made by an officer of the Diamond Rubber Company last December, was that even though the automobile business in general for 1908 might be much smaller than in 1907, the accessory manufacturers would have an active year. Time has more than confirmed this prediction, and it is interesting to note how correct the forecast has been in regard to the business of the Diamond tire people. Since March, the Diamond factories have been working to their fullest capacity, and the daily tire production was never so large as it has been during the past three months. A notable feature of the demand is the increase in the call for the quick detachable type, which has thus far prevented the Diamond Company from moving the Marsh rim factory from Columbus, O., to Akron, as will ultimately be done.

"We have received so many letters bearing on the subject of price-cutting that we find it necessary to issue this general statement prior to giving each letter individual attention," says the Goodyear Tire Company, Akron, O. "The meeting held by tire manufacturers May 21 resulted in the perfection of an organization and the presentation of plans for remedying the price-cutting evil, which will require some time and further meetings to thresh out. Pending concerted action on the part of the tire manufacturers, we have worked out a little plan of our own which will enable those selling Goodyear tires to meet the present conditions and make a profit on all sales. The greatest obstacle to profit-making at the present time seems to be the action of price-cutting jobbers in quoting consumers the same prices that most dealers are compelled to pay." In connection with the foregoing statement, the Goodyear company is requesting the cooperation of the dealers in preventing price-cutting.

John Willys, president of the Overland Automobile Company, Indianapolis, Ind., was the host at an informal luncheon given at the Marion club in that city recently. It was one of those delightful affairs that keep every man guessing as to just why he happened to be there, and the fourteen who sat down were kept in a state of mental suspense on this point until the postprandial ones got busy. C. G. McCutcheon of the American Distributing Company did his best to figure it out according to the integral calculus, while P. D. Lewis, of the Lewis Spring & Axle Company, tried the infinitesimal interim, but neither succeeded in figuring why $x = lunch$. There were several other "little parts" men who are in the habit of selling coils, radiators, axles and the like, but none of them divined Johnny's "motive." It remained for Frank Barnett of THE AUTOMOBILE and *Motor Age* to discover that Johnny was in a quandary himself, his problem being, "Why do parts men stand hotel lunches to customers?" On figuring the number of lunches he had eaten but not paid for, since making contracts for 1909 Overland parts, he was staggered

at the total, and on dividing it by 2,000—the number of Overlands he expects to turn out, he discovered that it amounted to $0.0183 per car. In future, he will buy his own lunches and feed the parts men besides.

H. S. Firestone, president of the Firestone Tire and Rubber Company, Akron, O., when asked the reason for the remarkable growth of this company during its career of eight years, said: "I attribute our success to our early recognition of the value of the highest quality of materials in rubber tires. At the start we adopted the policy of making tires only of the highest grade, and never have we even been tempted to decrease the quality by the use of cheaper material. An additional reason is the concentration of our efforts towards the betterment of rubber tires in general and Firestone tires in particular. We have worked longer on one idea that would improve tires generally than some manufacturers would spend to improve their own individual product only. In the present large factory are installed only the latest and most modern machines for the manufacture of rubber tires. Every convenience and improvement for the making of perfect tires is there. The attention of the company was first directed to the manufacture of solid tires for automobile trucks, and they were among the first firms to manufacture successful tires for vehicles of this class. The remarkable success achieved in the manufacture of solid tires was so gratifying that they decided to enter the pneumatic field.

NEW AGENCIES ESTABLISHED.

Sidney A. Bean, general sales agent for the Autocoil Company, announces the opening of the Detroit office at 730 Woodward avenue, where W. S. Austin will be in charge. Mr. Austin has been connected with the engineering department of the Autocoil Company for a number of years.

Levy & Fanning, Chicago, have just closed negotiations to handle the Chalmers-New-Detroit $1,500 car, which has been creating such a sensation, as well as the Chalmers-Detroit-Forty, in that territory. A new item in connection with the building of the smaller car is the company's frank statement that the factory cost of the motor is $261.

PERSONAL TRADE MENTION.

A change in the partnership existing between H. A. Rowan, Jr., and William A. Blair, who operated the Aldine Garage, at 2028 Sansom street, Philadelphia, under the firm name of H. A. Rowan, Jr. & Company, was announced last week, when Mr. Blair withdrew from the firm. Mr. Rowan will continue the business alone.

George W. Hipple, who has been a prominent figure in the sales end of the industry for several years past, has given up the Chicago representation of the Chalmers-Detroit Company, and will henceforth act as traveling representative of the latter concern, Levy & Fanning having contracted to handle this firm's output in Chicago.

L. E. Hoffman, southern traveling representative for the H. H. Franklin Manufacturing Company, Syracuse, N. Y., has just returned from a six-months trip, during which he placed agencies in a number of Mexican cities, besides Madeira, Yucatan, and Habana, Cuba. At New Orleans, he found a Model D Franklin awaiting him, in which he made a 17,000-mile trip, covering every Southern State except Tennessee and ending his trip at Philadelphia last week.

NEW TRADE PUBLICATIONS.

Gemmer Manufacturing Company, Detroit, Mich.—Gemmer steering gears for motor vehicles is the raison d'etre of the booklet just sent out by this firm, and it gives considerable information of value to the designer in brief form.

Manhattan Electrical Supply Company, New York.—Buyers of ignition supplies will be interested to know that the Manhattan Electrical Supply Co., 17 Park Place, New York, have just issued a 12-page folder showing the line they manufacture, including spark coils, switches, battery connectors, etc. A thoroughly revised edition of their pocket-size catalog—168 pages—"Something Electrical for Everybody," is also ready for distribution and can be had by mailing a postal to the above address.

Cameron Car Company, Beverly, Mass.—Text is subordinated in this instance to the numerous illustrations of the various models of Cameron cars, of which this company is the builder. Each one is attractively pictured on a separate page, and the corresponding specifications printed below it. Illustrations of the complete chassis, power plant and the special Cameron type of sliding change speed gear are also given, with a brief description, the catalogue being an excellent example of compactness and brevity.

Chase Motor Truck Company, Syracuse, N. Y.—Commercial vehicles equipped with two-cycle gasoline air-cooled motors form the subject of a catalogue just being sent out by this firm, and as is consistent with the nature of the vehicles, their description and illustrations are of the plain, business-like kind. A novelty not often found included in the catalogue of makers of such cars, is a gasoline-driven lawn roller, its power plant consisting of a two-cylinder, two-cycle, air-cooled motor, the change-speed gear being of the planetary type, giving two speeds forward and reverse, while the steering and control are the same as on an automobile.

Borbein Auto Company, St. Louis, Mo.—"Catalogus No. 8, Automobile Parts and Running Gears" is the latest piece of advertising literature received from this concern, and its increased size as compared with its predecessors of former years gives ample indication of the growth of its sponsors during that time. It is a 70-page booklet in a dark red cover and is entirely devoted to auto bodies and running gears, together with parts, all of which are fully illustrated and described. Some of these are axles, sprockets, chains, wheels, forgings for levers, pedals and the like and a number of similar lines, all of which are carried in large variety by this house.

Witherbee Igniter Company, New York City.—The first issue of the latest addition to the numerous house organs bears a striking cover in the shape of an illustration depicting part of a honeycomb with the bees at work, the whole being done in color, while across the top is the title of the new publication, "The Wither-Bee." It goes without saying that it is devoted to Witherbee ignition and ignition specialties, from spark plugs and cabls up through Witherbee igniters, or storage batteries, to the new Volta high-tension magneto. This first issue is very attractively printed and illustrated on heavy calendered paper and is not entirely given over to business, as it contains a short story in addition.

Adam Cook's Sons, New York City.—"Albany Grease" has been on the market so long that its name has become a byword among machinery users the country over, so that a little pamphlet with this title and the well-known trade-mark of its makers strikes one as familiar at first sight. In addition to explaining the various uses of Albany grease and the various grades, together with the purposes for which they are specially adapted, the line of special grease cups gotten out by this firm for use with their lubricants is illustrated and described. The different grades of greass to be used on automobiles in summer and winter are also outlined. The work is a little brochure slightly larger than vest-pocket size and is attractively printed and illustrated.

Mayo Radiator Company, New Haven, Conn.—This is a very attractively gotten up booklet in which there is probably less type matter than is usually consumed in the Foreword of the average catalogue, even though it be a very small one, for there are only a few lines of type in this whole work, yet it tells its story very effectively. Its title is "Automobile Radiators," and each page, which is printed on one side only, bears a photographic reproduction of the type of radiator made by this firm for some of the well-known cars, with a few words of description, such as "Type E Locomobile, 1906, 7, 8.," such well-known names as Stevens-Duryea, Pierce Arrow, Premier, Pennsylvania, Stearns, Marion, Simplex, Cleveland and a number of others being shown by these plates.

International Time Recorder Company, Endicott, N. Y.—"Time" is the significant title of a very attractively made up little magazine that is being issued in the interests of this firm. The March number shows it to be one of the most interesting publications of its kind now in existence, as many of the articles are from experienced contributors in the handling of time-recording devices, and they show how systems can be applied to checking the going and coming of any number of employees or piece workers, in any kind of business. One of the articles describes the method of keeping tab on cars in a garage and is entitled "How Garages Check the Chauffeurs." It is full of helpful information for the man who buys labor and is looking for the maximum return.

Pennsylvania Rubber Company, Jeannette, Pa.—"Factory Facts, for Buyers of Automobiles" is the cover title of an attractive little booklet issued by this firm. The "facts" referred to have to do with the manner in which Pennsylvania tires are manufactured and some salient points in the process of making them, as compared with others, are clearly brought out, together with the advantages that accrue from them in increased service and durability. For instance, "Fact One" deals with the vulcanizing of the tires; "Fact Two" shows the special bias woven fabric that is used in the making of Pennsylvania tires and shows its advantages over the usual fabric which has to be cut bias in comparatively short pieces, while "Fact Three" illustrates the special machine used for wrapping as compared with the hand process usually followed.

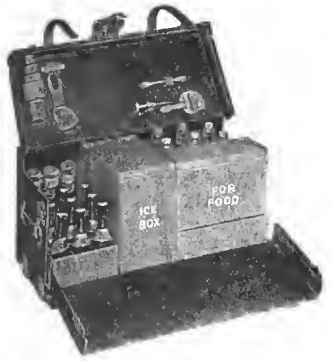
McKeown Brothers, Chicago.—This is a booklet descriptive of the "Lattis Truss," of which this firm are the patentees and builders. It is a form of construction especially adapted to the building of garages, in which it is very undesirable to have the floor encumbered with posts or pillars, particularly as trusses of the "Lattis Truss" pattern can be built up to 100 feet span of sufficient strength for all roof purposes. The booklet describes in detail the method of constructing the trusses, the materials used, and also gives a list of buildings in which this patented form of construction has been employed, and it is a noteworthy fact that quite a few of the prominent garages in Chicago and neighboring territory are found in it. The booklet is profusely illustrated with photographs of the various buildings in which the "Lattis Truss" has been used.

Keystone Lubricating Company, Philadelphia.—Specially prepared for the campaign this firm is now making in the introduction of Keystone grease in the automobile trade are two attractive folders, one entitled the "History of Lubrication," and the other "Heat Has No Effect on Keystone Grease." In the former is described the transition period of lubrication, in which dissatisfied users of oil were led to adopt the first kind of grease offered, and after having experimented with many, found that all had the faults of oil, or were even worse, owing to the fact that they did not combine the proper qualities of a lubricant. What these qualities are and how they are combined in Keystone grease is also related. In the second pamphlet, the importance of using a pure lubricant is dwelt upon, and the danger of employing animal greases on fine bearings, or for that matter, on any bearings, is made apparent. Both are excellent briefs for Keystone grease.

Stevens-Duryea Company, Chicopee Falls, Mass.—"Stevens-Duryea, 1909, Model X," in light green on a buff cover forms the preliminary word of a new booklet from these Massachusetts builders who are sending it out to introduce Model X, a newcomer to the Stevens-Duryea fold. In the actual foreword to the contents of the booklet, the makers point out the fact that in bringing out this new model improvements have taken the form of refinements rather than departures from principles previously followed, and a review of the specifications of the car shows this to be the case throughout. Model X has been brought out to fill the demand for a four-cylinder car having a little more power than the Stevens-Duryea Model R, which has been discontinued. As a matter of fact, Model X is practically an enlargement and refinement of its predecessor, embodying all those features of Stevens-Duryea design and construction that have become familiar. It is attractively described and illustrated.

INFORMATION FOR AUTO USERS

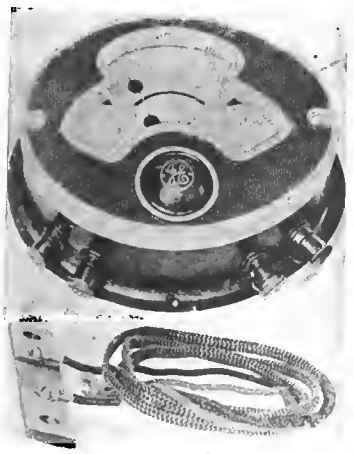
Auto Rear Ice Trunk.—Now that touring into more and more unknown parts of the country is coming into vogue, it is becoming customary to carry a supply of provisions and drinkables along so that entire dependence need not be placed on the casual wayside inn, that is so often lacking when most needed. To meet this demand, W. W. Winship, 71 Summer street, Boston,



WINSHIP TRUNK FOR COOL LUNCHES.

Mass., is placing a wide variety of different kinds of kits for this purpose on the market. One of the handiest is the ice trunk shown by the accompanying illustration. As will be seen, this is arranged with a zinc box for a large piece of ice, and has besides large individual boxes for fruit, meats, sandwiches, glasses. It holds six quart bottles, or nine pint bottles and when necessary, the entire interior fittings can be removed and the trunk used for ordinary purposes.

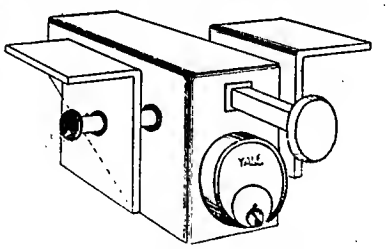
A New Auto Instrument.—The General Electric Company, Schenectady, N. Y., has lately placed on the market a new automobile instrument for use on electric vehicles. This instrument, known as the type DK, consists of a combination ammeter and



NEW G. E. CO. VOLT-AMMETER.

voltmeter enclosed in a dust and moisture proof aluminum case and is especially designed to withstand without injury the constant vibration and exposure incident to this class of service. The magnets used in DK automobile instrument are made from the best quality of magnet steel obtainable, the special processes of aging and hardening further insuring their permanency. Another important advantage is the fact that they are strictly dead-beat. The scale divisions are very uniform and legible. The standard voltmeter scales are 120 and 80 volts. Either of two ammeter scales is standard, viz., 150-0-150 or 70-0-150. It often becomes necessary to measure the voltage across individual cells and for this purpose a second voltmeter scale reading from 0 to 3 volts will be furnished on request. The severe vibrations to which automobile instruments on commercial vehicles are subjected, prevents the indications being read. To overcome these difficulties, the General Electric Company has designed an "Anti-vibration Support" upon which the type DK instrument may be mounted.

"Break-Circuit Auto-Lock."—There is nothing easier to make way with than an unguarded electric, while the possibilities of losing a gasoline car by theft are now very great as well. To prevent such a misfortune as this, the Safety Device Company, 431 East Tenth street, Indianapolis, Ind., are placing on the market what they term their "Break-Circuit Auto-Lock." Its construction is such that it can be readily in-



FITING OF BREAK-CIRCUIT AUTO LOCK.

stalled on any electric, and it is a very simple matter to attach it. In fact, it may be placed in two or three different locations, according to the particular arrangement of the car under consideration, and in any case, it is inconspicuous and not easily tampered with. Its appearance as installed in one of the numerous different ways which the makers suggest in their detailed instructions is shown by the accompanying line sketch.

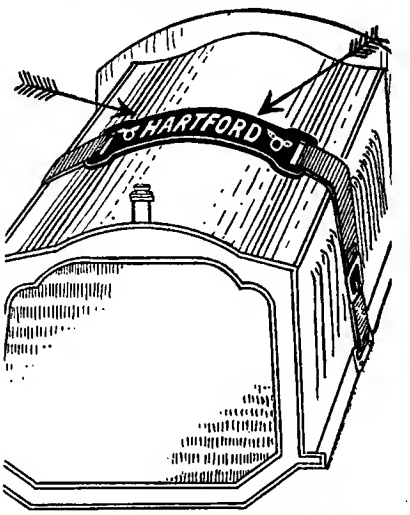
Style "B" Prest-O-Lite Tanks.—For use on small runabouts and roadsters, the Prest-O-Lite Company, Indianapolis, Ind., manufacture what they term the Style "B" tank. The latter has a capacity of 40 cubic feet. Many autoists who have invested in these small tanks find out later that the Style A tank with its capacity of 70 cubic feet would have served their purpose better. To all such, the Prest-O-Lite Company is making a special offer. They will refund the full purchase price, supplying one of the larger tanks for the difference in the list, amounting to $15. Although the Style A tank has almost double the capacity of its small brother, there is only a difference of $1 in the cost of recharging. Any of the numerous Prest-O-Lite branches or agencies will make the exchange.

Quick Detachable Terminal.—An entirely new form of quick detachable terminal for use on primary and secondary circuits has recently been put upon the market by the Conn. Telephone & Electric Company of Meriden, Conn. A great deal of trouble has been caused heretofore by the breaking of connections on timers, etc., and if the Connecticut Quick Detachable Terminal possessed no other advantage than the elimination of such annoyance, it would prove its value many times over. The ball and socket construction allows the connector to swivel or turn in any direction. The Connecticut Terminal is made up in two types suitable for use as a primary or secondary connector. The secondary connector is fitted with a rubber collar or sleeve which covers the end of the wire and makes a very neat finish. It is simply necessary to cut the wire off straight, push on the rubber sleeve, pass the wood screw through the hole in the stud and screw it down tight. The primary terminal is connected by cutting off the wire straight, slipping it into the hole in the stud carrying the spring, then placing the screw in position (as indicated in the illustration), screwing it down tight.

QUICK DETACHABLE TERMINAL.

Both the primary and secondary terminals are furnished with an adapter, as shown, unless otherwise specified. These adapters will fit any plug or terminal (not over 3-16-inch in diameter) by removing thumb nut, slipping on adapter; then place thumb nut back on screw. It is being shown by the National Sales Corporation, 296 Broadway, New York.

Hartford Hood Anti-Rattler.—There is nothing quite so annoying about an otherwise well-kept car as to have a persistent rattle, which means nothing in itself, but which sounds as if it portended something serious to the uninitiated ear. Many an otherwise well-designed hood is frequently guilty of this, and to eliminate the annoyance, the Hartford Rubber Works Com-



HARTFORD ANTI-RATTLER IN PLACE.

pany, Hartford, Conn., has just placed on the market what they term the Hartford "Hood Anti-Rattler." It consists of a strip of flexible rubber about a foot long by two inches wide and 1-4-inch thick. It is slotted at each end and when placed over the center of the hood, the leather straps are drawn through these ends and then buckled down firmly. The rubber takes up the vibration and deadens the noise.

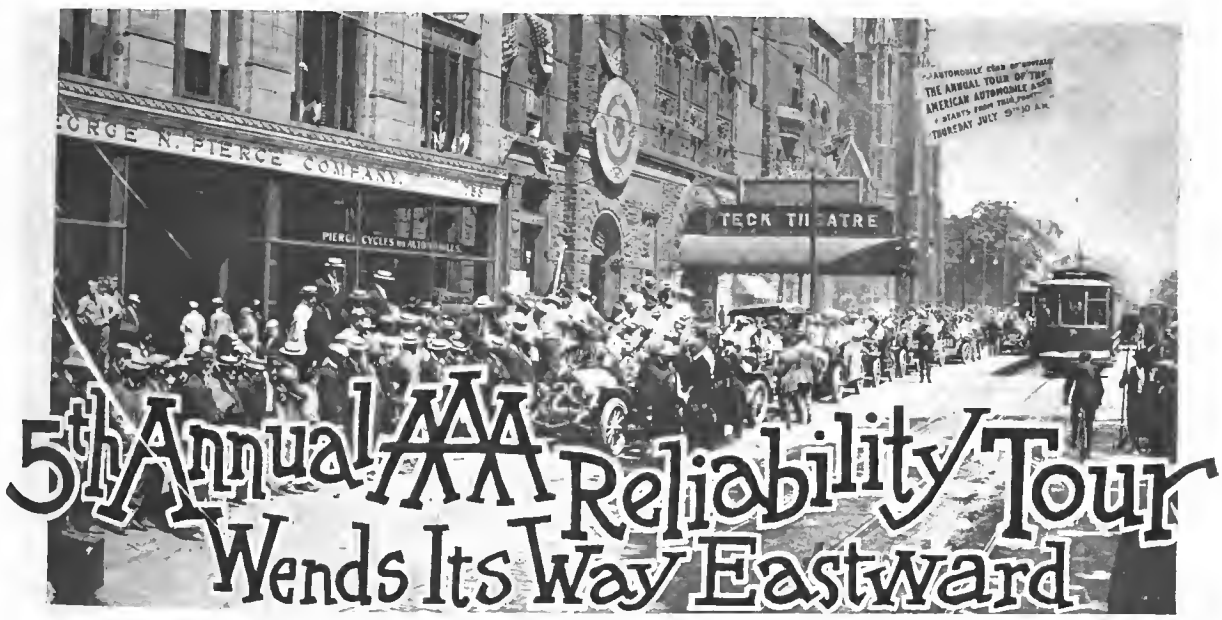
VOL. XIX NEW YORK—THURSDAY, JULY 16, 1908—CHICAGO No. 3

THE AUTOMOBILE



5th Annual AAA Reliability Tour Wends Its Way Eastward

Where the Start Was Made in Front of the Headquarters of the A. A. A. Touring Board, and Automobile Club of Buffalo.

CAMBRIDGE SPRINGS, PA., July 9.—Seated upon the verandas of a commodious and urbán appointed hostelry set upon a hill with a wide prospect of hills and meadows, 300 well contented Gliddenites and Howermen are discussing to-night with satisfaction the outcome of the first day's run of the fifth annual A. A. A. test tour. Forty-six cars contesting for the touring car and runabout trophies and 10 non-competing and official cars had left Buffalo in the morning and had reached Cambridge Springs with the loss of but one of their number—a six-cylinder Gearless runabout, which had collided with a telegraph pole at Westfield, lost all its Hower trophy points, and, in fact, had put itself out of the running for good and all.

All of the other 45 prize contenders had evolved from the day's run without penalization, having made the 117.4 miles run in the 5 hours, 45 minutes schedule time and without any replacement of parts. Had the boss of the run, however, not been a bit lenient, under the rules there would have been several sufferers from too eager promptness or too cautious tardiness in crossing the finish line. The new rules with their allowances for tire repairs and price difference, bothered some a bit, so Chairman Hower cancelled all errors, since the cars were really all on schedule time, but warned all hands that in future ignorance of the law would excuse no one. It took a lot of time and explaining at the daily evening meeting of contestants and observers to get the new rules fixed in all minds. It is to be hoped at least that they are or there will be trouble brewing.

The legal speed limit schedule of 20 miles per hour had been easy to maintain with 56 miles of macadam between Silver Creek and Erie, and the balance of the way at either end of this magnificent stretch over fair country dirt road, is for the most part over fairly level ground.

Buffalo gave the caravan a rousing send-off. For half a mile from the starting point, the street was a continuous grandstand of automobiles on either curb and fully five thousand foot passengers joined in the *bon voyage*. The first car was sent away promptly at 10 o'clock from the Automobile Club of Buffalo, in the Teck Theater building, and the 45 others at one minute intervals thereafter.

By the roadside in South Park, through which the procession passed out of the city, were scores of motor cars parked to bid farewell. In fact, for miles out into the country were automobiles that had been driven out to see the tourists well on their way. The day was sunny, yet cool, and the scenery of appealing gentle beauty, on either side were well kept farms and thousands of acres of vineyards, while in the distance on the right one could see most of the way to Erie, the deep blue expanse of Lake Erie, as beautiful and as impressive as any Atlantic or Pacific.

All along the roads the people had turned out to see the tourists pass. Rosy-cheeked, white-frocked girls waved graceful adieux. Small boys cheered and stormed every car that stopped for cigar bands as souvenirs. At one place a bunch of lassies

Chairman Hower Starting Secretary Lewis in the Pilot Premier Car —Cup Donor Glidden in Front.

held aloft a gigantic canvas sign, "We Hope U WIN," while at Evans Center a hay wagon load of damsels had driven down to see the fun. Tom Fetch made a hasty dismount and gave some photographers a snapshot with Packard's Pride enviably ensconsed in their midst.

In line there were not a few cars that merited and received attention. An Oldsmobile rigged with a Gabriel horn stirred up the countryside by playing popular airs and did not forget, of course, "In My Merry Oldsmobile." The Premier, which is making a century a day for 100 consecutive days, is making its present runs with the tour. "El Toro," the first of the 1909 Packards, which won fame by its Cuban run last winter, was rigged with a close-coupled body and used as a press car with the only Tom Fetch as its pilot and F. C. Riggs in the rôle of Mine Host. It was the niftiest, nattiest outfit in line. The five passengers wore gray caps and dusters to match the gray body and their luggage was packed conveniently out of the way on the rumble platform in gray aluminum boxes.

A Reo carried THE AUTOMOBILE and *Motor Age's* mechanical and photographic staff and had Sales Manager Renshaw for its pilot. It put its passengers on the spot for every emergency and caught the leaders at will when necessity required. A Reo and a Premier served as pilot cars. A Packard with Russell Huff at the wheel bore the Red Cross banner, carried a physician, and transported the starter and checker from start to finish. The two watchmen were borne in a Stevens-Duryea, which started next to Chairman Hower and Charles J. Glidden in a Great Arrow, acting as pacemaker.

There are two women contestants this year. Mrs. Joan Newton Cuneo, of New York, is competing in a Rainier for the Glidden, and Mrs. E. W. Shirley, in an Overland, for the Hower trophy. Mrs. E. S. Berwick is Mrs. Cuneo's guest and Mrs. H. C. Marmon rides beside her husband. By way of illustrating the improveemnf of American cars in a few years it was recalled by old timers that a run of 91 miles from Buffalo to Erie was considered an ample day's journey for the Pittsburgh tour of 1903 and for the St. Louis run of 1904. This year Erie was reached by most of the cars in a round five hours. Turning from Erie inland, the cars had a pretty run over a rolling country to Cambridge Springs, where the many Spring hotels and boarding house guests gave the tourists a warm welcome, as did all the towns en route. At Westfield hundreds of bottles of cool grape juice were put in the cars by the Welch Grape Juice Company.

JOHN C. WETMORE.

As the Cavalcade Passed Through Erie, Pa.

How the First Day Appeared to the Technical Man.

CAMBRIDGE SPRINGS, PA., July 9, 1908.—Of the fifty-eight cars scheduled to leave Buffalo this morning on the fifth annual Glidden tour and the Second tour for the Hower trophy 56 left and 55 reached Cambridge Springs with perfect scores, the one to suffer penalty and drop out being No. 105, the Gearless runabout entered and driven by John Breyfogle of Rochester. This car was eliminated when three miles east of Westfield. The car, traveling at a fast pace, struck a round stone in making a curve which resulted in an unexpected skid that brought the machine radiator end on into a telegraph pole, bending the frame, breaking parts of the steering mechanism and putting it permanently out of the running for the Hower trophy. Fortunately none of the party was injured.

On the Way to Cambridge Springs—Pierce Great Arrow Team.

The schedule for the 117 miles was 5 hours and 45 minutes for the big cars with 10 minutes extra added for the small Hower cars listing at $2,250 to $3,500, $1,500 to $2,250 and under $1,500, respectively; 10, 20 and 30 minutes extra, respectively, for Glidden contestants listing at less than $2,500. The start from the Buffalo Automobile headquarters was purposely delayed until 10 o'clock in order that Starter Ferguson and Chief Observer Stidham would have a good opportunity to drill observers and drivers in what will be the daily routine to be gone through in taking a car out of the night parking space. With police assistance this was well managed and at 15 minutes before ten the cars with drivers and observers in place were lined up along one side of Main street awaiting the start. The start was to be according to receipt of entries, the first received entry going first, being No. 100, the Great Arrow runabout in the Hower contest. Behind it were the three Great Arrow Pierces Nos. 1, 2 and 3 constituting the team in the Glidden contest. Fourth position was occupied by R. M. Owen in his two-cylinder Reo Glidden contestant with four passengers up and ranged behind him were Nos. 5, 6 and 7, the three Peerless Glidden machines forming the team of the Automobile Club of Columbus. It was noticeable how teams clung together, Nos. 29, 30 and 31, the three Garfords, making up the Cleveland team, being together.

The rule permitting the carrying of but four passengers, if desired, in the big Glidden touring cars was very closely ob-

An Official Gasoline and Oil Station on the Road.

The Fisk Rubber Company's Locomobile, Tire Laden.

served, all of the big Pierce, Peerless, Marmon, Franklin, Garford and other machines carrying but this number. There were one or two exceptions: Paul Gaeth in his Gaeth car started out with five, so did No. 11, the Buse six-cylinder Thomas, but all others carried four which was in marked contract to the five and six carried in many of the contesting machines a year ago. Among the Howe trophy candidates, the Franklin, Reo and Blomstrom started out with two, but all others, from the big Pierce down to the three little Overlands, carried the three passengers. On many of the runabouts with the single bucket seat not a moiety of comfort was for the observer who occupied it. In a few cases handles on the backs of the front seats offered good holding space, but in others these were absent, and the bad roads made it a precarious perch.

Standing of the Teams at First Day's End.

At the end of to-day's run all of the ten contesting teams have perfect scores or credit marks of 1000 points. These teams are Buffalo Automobile Club, 2; Rochester Automobile Club, 2; Chicago Motor Club, 2; Syracuse Automobile Club, 1; Cleveland Automobile Club, 1; Columbus Automobile Club, 1; Bay State Automobile Club, 1. DAVID BEEGROFT.

SECOND DAY—CAMBRIDGE TO PITTSBURG.

PITTSBURG, July 10.—To-day's run through the great steel mill towns of Pennsylvania was an ovation that continued during the latter half of the journey and culminated in a great demonstration in the Smoky City. The caravan arrived with its competing members lessened by one more off the perfect score list and another wounded by a repair penalization. In passing through New Castle, where the enthusiastic inhabitants urged the tourists to slow their paces, H. S. Van Tine, driving Garford No. 29, in dodging a man in the road, skidded into the curb and put its rear wheel out of commission. A new wheel was obtained from a car of the same make and fitted. This was a new part not carried and so the car had to be disqualified under the rules. Though it lost two hours in making the repair, it made up all but a half hour. It was hard luck that the Cleveland team shoud lose its perfect score through a mere life-preserving accident. Oakland, No. 28, burned out a connecting rod bearing and had to make a replacement which cost it three points, to which four points had to be added for tardiness. A. L. Kull got in very late with the little $750 Gyroscope and was charged with 296 points. Overheating had been the trouble that was responsible for its long delay.

At Hotel Rider, Cambridge Springs, Pa., Where the First Night Was Spent.

Crossing a Pioneer Bridge in the Pennsylvania Mountains.

The run to-day called for 122 1-2 miles in six and one-half hours, an average of 19 1-2 miles per hour. The original route was so changed that only the 44.6 miles to Mercer remained of the lay-out. New cards were given out from Mercer to Sewickley (103.2 miles) and from this point into Pittsburgh the tourists had only confetti and signs to rely upon. The journey was by no means an easy one. The 63.2 miles' trip to New Castle was up and down short, steep hills all the way. Then came brick pavements through the towns with rough country road between as far as Sewickley, whence there was fine macadam most of the way into town.

The wave of welcoming enthusiasm began to roll at New Wilmington. The town was literally smothered in flags, and every man, woman, boy and girl seemed to have one to wave. At one point a long hedge blossomed with little flags, and at another a building frame fluttered with scores of them. All through this section the course was marked by the white flags of the Automobile Club of Lawrence County. Everywhere the girls had donned their white Sunday-go-to-meeting dresses. The chief enthusiasts, though, were the small boys, who are taking a significant interest in motor cars that will mean much in the future generation for the universality of their use, the building of good roads, and the enactment of reasonable legislation.

It was at New Castle, though, that the enthusiasm of the welcome to the caravan reached its culmination. Sporting blood runs rich and red in New Castle veins. All the intersecting streets were roped off. At every one of the many turns of the route through the town there was a flagman. Every policeman yelled "Go on!" and every man shouted, "Hit her up!" No wonder some of the drivers lost their heads and sped down the narrow lanes of spectators at 40 miles an hour. It was a kind Providence that saved the good New Castle sportsmen from furnishing the dailies with headlines.

At Quaker Valley, Edgewood, and Sewickley the caravan entered Pittsburg's suburban park residential districts. The macadam wound among the palatial country homes of the steel magnates. From this point the tourists were to rely solely on Dai Lewis' confetti trail, but Philip S. Flinn, a former perfect score Glidden ite, and his fellows of the Automobile Club of Pittsburg had put up signboards all the way into town. For this they were thanked by special resolution at to-night's meeting of the contestants at the Schenley.

Great crowds greeted the caravan with effervescent enthusiasm as it entered and passed through the Smoky City. Speed limits were thrown off and the police joined in urging the drivers to "hit it up," just as they had at New Castle. The weary travelers had a luxurious evening's rest at the Schenley. They dined on the veranda or strolled on the lawns while they listened to the classic strains of the famous Pittsburg orchestra. But everyone turned in early in anticipation of the next day's work.

J. C. W.

Penalizations of the Second Day's Run.

PITTSBURG, PA., July 10.—Three Glidden contestants were penalized to-day, but the penalty against one lifted by the committee, leaving the count but two, enough, however, to put two of the ten teams struggling for the Glidden trophy out of the perfect score class, the second Chicago Motor Club and the Cleveland club teams losing. The three losing cars carried Nos. 27, 28 and 29 and were two Oaklands and a Garford. No. 28, J. B. Eccleston's Oakland, was debited two points because a passenger other than the driver and mechanic poured some of the gasoline into the tank at one of the fuel stations. This was allowed to stand, but the committee later decided to remove the penalty and also not to make it penalizable for any of the passengers to put in gasoline or water. This decision, rendered at the night meeting, was received with applause by all of the contestants. No. 28 Oakland, of the Chicago team, burned out the lower bearing of a connecting rod and had to put in a new rod. This work was facilitated due to the peculiar motor construction of the Oakland, which is a two-cylinder vertical power plant with removable cylinder heads. Removing the heads with the access offered by side openings in the crankcase gave suffi-

Hal Sheridan's White Steamer Descending a Rugged Hill Near Cramer, Pa.

cient room to take out the old and fit the new connecting rod without other dismantling of the motor, the driver and mechanic doing the work in a little over one hour. In spite of the delay the car made up all of its time but four minutes. Its total penalty was seven, three for replacement, the connecting rod costing $2.20, and four for time. This gave a penalty of 2.3 against the team composed of the two Oaklands and Mrs. Cuneo's Rainier.

The Cleveland Automobile Club suffered more severely, in that No. 29, Garford, was given the whole debit of 1,000 points because of the breaking of a wheel and replacing it with one not inventoried at the start of the tour. The accident occurred in the outskirts of New Castle, Pa., through which town fast speed was made by many of the cars because of the encouragement given them by the police and the demands made for speed by the thousands of citizens who thronged the streets. Leaving the city many right-angled turns had to be made and after taking one of these the car quickly swerved, causing a bad skid, thus throwing the wheel against the curb and wrecking it. A new wheel was taken off a car in New Castle and the car completed the day's run and will continue to the end of the trip. The entrant made certain protests to the committee against the disqualification on the ground that the accident was the result of a measure to conserve life. After a hearing the disqualification was allowed to stand. The remaining 28 cars fighting for the Glidden trophy finished with clean scores, as did the two Stevens-Duryeas in the contest for Glidden certificates. And of the 13 Hower trophy cars one, No. 113, the Blomstrom gyroscope, was given 296 points on time, it not reaching the checking station at Hotel Schenley, Pittsburg, until ten minutes to ten. The driver, A. L. Kull, reports the lost time due to five changes of tires that had to be made.

An important feature of to-day's run which THE AUTOMOBILE correspondent had an excellent opportunity of observing was how the cars performed on Kennedy's hill a couple of miles out of Meadville. This hill is a winding ascent of over a mile with water gutters across the road, plenty of sudden 15-per cent. grades followed by smaller grades and good turns. Garden's Great Arrow was first to take it; he made half the ascent before dropping from direct. Arthur Kumpf, who followed him a few rods, took the hill the same way and a little later J. W. McGuire in the third Pierce, went entirely up on the high. Burman in his Peerless made a nice high gear run of it and so did one of the Stevens-Duryeas. The air-cooled Franklins performed particularly well and passed other cars with facility on the hill. One of them took a Studebaker in tow when half up the hill and on the steepest part of it, and another did the same trick with Frank Nutt in his Haynes. The sport on the hill was watched by scores of motorists who had come from surrounding towns eager to see what the tourists would do on a hill that gives the local motorists plenty of trouble. Mrs. Cuneo was loudly cheered as she made the ascent well up on the high and only changed when near the top. Mrs. Shirley was also well received in her little overland. R. M. Owen in his Reo changed from direct when crossing a sidewalk across the road in the center of the hill and immediately went into direct again and made the remainder of it on direct. The hill is very deceiving from the foot, which was largely responsible for the poor performances not a few of the cars made. At times the machines were coming up in twos and threes and this sight coupled with that of watching them approach the hill over a mile of fine macadam in the valley made one of the most interesting points of this year's Glidden. Tire troubles occurred everywhere, the loose stones working particular havoc all along. When but a short distance out of Pittsburg, Foster's Gabriel Horn car had to change a left front casing. No. 9, H. O. Smith's Premier, had tire difficulties just before starting the mountain climb. No. 5, the *Motor Age* Reo, changed a right rear casing in the mountains, and No. 38, Fiske tire car, reported changes of tires being made at many points along the course, the pneumatics causing frequent delays throughout the day's run. THIRD DAY—PITTSBURG TO BEDFORD SPRINGS.

BEDFORD SPRINGS, July 11.—The run to-day carried the caravan across three mountain ranges of the Alleghenies with magnificent scenic surroundings, but—Oh! such roads! A new and tougher path by far than that of last year was laid out, yet hard-hearted Hower cut the running time from 9 to 7 hours, an average of 17 miles an hour for the run of 106.4 miles.

There was only one knocked out for all that, the No. 111 Overland runabout, driven by C. R. Forth, which hit a rut just out of Pittsburgh and went down and out with a broken axle. A leaky carbureter exuding gasoline in the neighborhood of the magneto caused a bad fire on Stoddard-Dayton runabout No. 109, which cost it 168 points. Overland runabout No. 108 failed to make the schedule by 9 minutes, and A. L. Kull's little $750 Gyroscope did not get into camp until one o'clock.

This was not the total of casualties and penalizations to be reasonably expected from such a day's pushing up mountains, pounding over rocks and hammering bumps by 803—some one claims to have counted them—thank-ye-marms. There were some noteworthy fast runs made. Billy Hurlburt was delayed an hour and three-quarters and was forced to cover the course in 5 hours 7 minutes to escape time penalization, and the other Garford, which is now running as a non-contestant, was driven by Van Tine over the last 26 miles in 59 minutes.

The environing scenery was varied and roughly picturesque most of the way. One beautiful stretch of macadam which ran through the Connemaugh Valley into Johnstown gave a view of a dark green stream below shut up by high, steep mountainsides. We of the "El Toro" outfit lay over in Johnstown for dinner and were shown the water mark on the Capital Hotel and told by Mine Host the thrilling story of the great flood which cost no less than 3,000 lives so many years ago.

Picturesque Road That Led from Mt. Dallas.

Out of Johnstown a four-mile climb gave a taste of what was ahead before the two intervening mountain ranges could be surmounted. Then followed the long pull over the Allegbenies. Seventy miles' running through a narrow valley hemmed in by steep wooded hills brought the caravan to the Bedford Springs Hotel. There was such a good attendance of regular patrons and non-motoring guests that many of the Gliddenites were forced to seek accommodations at another nearby hotel or at the village inns. There was a rush for the swimming pool. In the evening there was a peaceful loaf on the verandas and lawns, though a few indomitable terpsichoreans like Spooner and Lazarnick actually had enough in them for a dance.

Sunday Was Spent at Bedford Springs.

BEDFORD SPRINGS, PA., July 12.—This old-fashioned resort hostelry nestled in an umbrageous little valley with green tree-shaded lawns formed an ideal spot for a rest from the three days of road battling that have passed and for the week of highway campaigning that is ahead before Boston's haven of two days of rest is reached next Friday night. There was to-day the luxury of a late breakfast. Then came a two hours' frolic in the swimming pool. A few, very few, took rides in their cars. The one strenuous machine was the Premier press car, which H. O. Smith and *Fate* have condemned to a 10-000-mile treadmill, made up of a hundred consecutive centuries. It made a semi-century morning and afternoon and reached, if the writer's tired memory serves him right, its 49th hundred-mile run to-day, so that its task is about half done.

The newspaper men alone were forbidden to join the loiterers. They had lost time to make up and thoughts to put to print, the inspiration of which had hitherto been robbed by long days of hard riding. So far there has been harmony. Penalizations have been accepted without strident protests. Of course, there have been kicks over the room allotments. There always will be.

J. C. W.

Troubles of the Third Day Technically Told.

BEDFORD SPRINGS, PA., July 11.—To-day's run of 106 miles over the mountains from Pittsburgh to Bedford Springs did not prove the undoing of so many perfect scores as speculation had prophesied, the reason for this being the seven-hour schedule set for the big cars, with the usual extra allowance of 10 minutes for the small Hower cars and 10, 20 and 30 minutes for the smaller Glidden contestants. Only two of the Glidden Cup rivals had trouble: 19, Frank Nutt's Haynes losing the center bolt out of one of its springs. As yet it is not known whether Nutt will receive a penalty or not, owing to the fact that he took the spare bolt used out of the sealed bag containing extra spare parts, which would entail a penalization of one point. After his arrival here, Nutt declared that he has one of these bolts in his regular parts bag and if so he will be allowed to use it

and will not be penalized, as the use of regular spare parts does not entail any debit marks against a Glidden contestant.

Not so fortunate, however, was William Hurlburt, driving No. 31 Gsrford, which hroke one of the drive shafts in the floating rear axle. In all, one hour and fifteen minutes were needed in removing the old shaft and replacing the new one. After this was done, Hurlhurt gave an excellent demonstration of road driving, succeeding in heating the seven-hour schedule by eight minutes, showing that he had negotiated the 106 miles of mountain travelling in 5 hours and 7 minutes, or at over 20 miles per hour, a wonderful performance considering the long mountain climhs, the tortuous mountain descents, the scores of water breaks and the frequent stretches of road on which loose stone and dirt were piled. Hurlbut's total penalty has not yet been placed. This Garford trouble, taken in connection with that experienced hy Garford No. 29 on Friday, when a wheel was hroken, puts the Cleveland clubs in had shape. These two troubles do the cars an injustice hecause all three were brand new from the factory and had not been run or limbered previous to the start from Buffalo on Thursday morning.

What Happened to the Hower Trophy Contestants.

In the Hower ranks five cars came to grief, four of which received penalties. No. 108, Mrs. Shirley's Overland, was penalized 9 points for time; No. 109, Stoddard-Dayton, entered by H. C. Tillotson of Chicago, was debited 168 points on time, the trouble arising from the gasoline around the carbureter igniting from a short circuit on the magneto. In this car the carbureter, magneto and timer are grouped on the left side and the vapor formed from a leak in the carbureter quickly ignited when a short circuit took place. The mechanician's hands were severely hurned in extinguishing the hlaze, which was confined to the motor. Dr. Hoag in the Red Cross Packard fortunately was near at hand and dressed the wounds. The car continued its trip. This car also suffered a fracture of the two hrackets to which the forward end of the radius rods attach. These brackets are bolted to the side members of the frame and new ones which were carried in the spare equipment were used.

No. 111, Overland, hroke a rear axle a short distance out of Pittsburg, and took the full count of 1,000, the car discontinuing the tour. The accident happened when on a fairly good road, the rear wheel spreading and the differential case settling to the ground. A. L. Kull's Blomstrom Gyroscope, No. 113, checked out of Pittsburg hut did not reach here until midnight.

Monday's Was a Very Hard Day's Run.

To-day's run was one of the hardest of the contest so far and it is gossip here to-night that none of the succeeding days of the tour will approach it. There are longer days' runs scheduled, some reaching thc 194-mile mark, hut these will he

The Garford Passes a Ruined Farmhouse.

over good road surfaces on which cars can make fast time. In to-day's climb over the Alleghenies, the road for miles was hut a sandy trail with stone hottom winding between acres of burned woods at one place and dense forests whose hranches formed a continuous arch across the roadway and hrushed the heads of the drivers and passengers at other places. The roads twisted and contorted every fifty or two hundred feet and were crossed hy improvised hridges whose planks got out of place after the first car or so had crossed. On these roads the water hreaks were not so omnipresent as on the course followed a year ago, hut what was gained by their ahsence was more than compensated for hy the masses of hugh hroken boulders over which the cars had to travel with the danger of one or two punctures while going over them. D. B.

FOURTH DAY—BEDFORD TO HARRISBURG.

Harrisburg, Pa., July 13.—The 107.3 mile run from Bedford Springs was almost a repetition of Saturday's journey from Pittsburg. Though two-thirds of the journey's end into Harrisburg was over a fairly good macadam, and, in fact, stone roads ran most of the halance of the way, there was a far more constant pounding over water hreaks at an average of 200 feet intervals and the long climhs up Mount Dallas and Mount Cove were through long stretches of heavy sand. The six-hour schedule calling for an average of 18 miles an hour played the mischief with fast running the first third of the journey and gave the cars a merciless hammering that promised to tell heavily on the scores at the end of the day.

In the face of such a journey no little havoc was wrought on the perfect score slate. Two teams, in fact, dropped hack into the ruck of the also-rans. The Syracuse and Rochester trios evolved with a car apiece penalized. Franklin No. 12,

Where the Cars Were Parked at Harrisburg at the End of the Fourth Day's Journey.

One of the Good Luck Signs That Greeted Them.

driven by C. H. Talbot, which had broken and mended a spring the first day, stopped at Harrisonville to weld a new spring leaf under the amended rules permitting new parts to be made out of raw material and arrived so late that it lost 61 points. The Selden, which also had had trouble with its springs, was very late. Its exact penalization had not, however, been announced at the writing of this letter late in the afternoon.

The Hower runabout perfect score division was still further decimated. Franklin No. 106, piloted by J. H. Daly, broke several front spring leaves and suffered a penalty of 181 points. Moline No. 102, driven by W. H. Vandervoort, sprung a leak in its cylinders three miles outside of Harrisburg and was penalized 51 points. It is hoped, however, that the leak can be plugged so that the car can continue.

To-day's journey was another day's run through magnificent mountain country. The long hard pulls of three or four miles up the sides of the Blue Ridge range had their compensation during the winding descents of glorious panoramas of broad farm checkered plains or picturesque valleys with green wooded hills some times in the foreground and at others blue mountains in the distance adding to the charm of the scene.

Old Chambersburg reached and historic rebellion days' ground was traversed. Before and after the Battle of Gettysburg the Yanks and Johnny Rebs fought through the streets of the old town, part of which the confederates burned in their retreat.

The caravan passed also close to the buildings of the Indian School and also of Dickinson College at Carlisle. All this was very interesting, but all the tourists asked why in the mischief Frank Hower had taken it into his stubborn head to cut them off from a view of the famous Gettysburg battlefield, which was only 25 miles away and could easily have been reached, while it also afforded a run over some of the finest stone roads in Pennsylvania. He played the caravan the same mean trick on the tour last year and there was much uncomplimentary comment.

The Rapid Car That Carries the Goodyear Tires.

There was the same enthusiastic reception that marked the first three days of the journey. The Chambersburg Motor Club not only stretched a banner, "A. A. A., We Hope U All Will Win" across the road, but built a triumphal arch inscribed "Welcome" on the main street of the little town.

It was a refreshing sight that made one realize that he was out in the real country to see the calico sunbonnets of the women and the blue jeans of the men so universally prevalent inside the towns. All along the entire route one ran across Cadillacs, Fords, Ramblers, and even more pretentious cars of the Franklin type owned by the farmers. There were also not a few higher priced cars by the roadside filled with fashionably gowned passengers from the towns.

The "Gabriel Horn" car, piloted by C. H. Foster himself, is adding much life to the tour and stirring up the countryside in great fashion. All through the towns the pianoist hits up lively airs and gives the people a listening knowledge of "The Gang's All Here" and the latest Broadway musical comedy songs which as yet have not reached this far.

That live wire bunch, the Motor Club of Harrisburg, is giving the tourists a smoker to-night. The caravan is split between two hotels, the Lochiel and the Metropolitan. The former is official. The latter, though, has a bath to each room and the press boys for once seem to have the better of the deal.

Motor Club of Harrisburg Gives a Smoker.

At the Motor Club of Harrisburg's smoker speeches were made by Hon. Edward S. Stewart, Governor of Pennsylvania; Hon. E. S. Meals, Mayor of Harrisburg, who, as vice-president of the club, spoke in the absence of Vance McCormack, the president, at Denver. Incidentally R. H. Johnston, referee, and D. A. Beecroft, chairman of the A. A. A. Technical Board, presented the medals won in the club's recent endurance run.

Tentatively Chairman Hower has asked not a few of the makers on the run what they think of running next year's tour to Denver—it being an open secret that the Colorado metropolis is in his mind as the 1908 destination—being run circus fashion with a camp pitched each night by professional tent men. The novel idea is making a hit. J. C. W.

How the Fourth Day's Run Told on the Score.

HARRISBURG, PA., July 13, 1908.—To-day was calamity day in the Glidden and Hower ranks, two of the perfect score teams falling from grace and three of the perfect score Hower runabouts being eliminated. The Syracuse Automobile Club has 20 demerit marks chalked up against it due to No. 12 Franklin touring car being 60 miutes late, for which it received 60 points. The cause of the trouble was due to the breaking of the rear spring that broke on the first day's run near Fredonia and which was so quickly welded. To-day it broke in the same place, and the repairing cost 60 points, which counts 20 against the club, making its mark 940. Although the spring has been rewelded the driver is doubtful as to whether it will endure much longer. Much talk has been occasioned because of the Franklin spring trouble and not a few of the tourists ascribe the trouble to not equipping the machines with shock absorbers. The other club to suffer was the Rochester one, composed of the Gaeth, Thomas and Selden, the Selden being the offending member of the team, its troubles resulting from the breaking of all of the leaves of a spring on Saturday's run to Bedford Springs. This leaves but seven perfect score teams in the Glidden cup struggle, namely, two Buffalo teams, first team in Chicago Motor Club, the Studebaker-Rochester team, the Marmon team under the colors of the Bay State Automobile Club and the Columbus club composed of the Peerless cars.

The three to fall in the Hower ranks are No. 102, the Moline runabout that was held up within three miles of Harrisburg due to motor troubles and was penalized 51 points on time, the motor trouble not calling for any replacements of parts. No. 106, the Franklin runabout, had trouble because of breaking one

(*Continued on page* 105.)

GERMANY'S VICTORY IN GRAND PRIX OF FRANCE

Mercedes Redivivus, then Benz and Benz Again, with Clement Fourth Followed by More Germans—Italy Fails to Figure Dangerously

By A. G. BATCHELDER

DIEPPE, July 7.—France to-night isn't exactly sure that automobile racing pays. "Made in Germany" it a label that does not find extraordinary favor in the land of the fleur de lis. To have had one Lautenschlager the winner of the Grand Prix were sorrowful enough, but to have had his Mercedes chased by two Benz racers and the nearest French contender a fourth, added to gloom still further intensified by the subsequent arrival of three more Germans. Think of it! Six cars out of the first ten bearing the hated label and that tenth one from Belgium! No wonder that the departures from the grandstand began before the elated Lautenschlager had completed his tenth round. Yes, he received some cheers—there were a goodly number of Germans present—but the enthusiasm of the multitude evoked that same quality of joy which may be expected when the home team loses out in the ninth inning and there is no consolation.

Mercedes presumably had been placed on the shelf by the French makers, and as for Benz, that car had been heard of in the early days of automobiling. Opel was a name unknown. And to have these intruders survive the ordeal in superb manner, and only a single French car intermingle with them, was cause for lamentations prolonged and undisguised. Last year it wasn't quite so bad to have Nazzaro of Italy win with French runners close up, though that blow gave the racing advocates a jolt that benumbed them for the whole year intervening.

The Gordon Bennett, with all countries participating having five cars each, didn't give France as much chance for victory as she thought her automobile importance entitled her to, and so that event had to give way to the Grand Prix, wherein every maker can have three cars each. For like reason the Vanderbilt, being similar to the Bennett, received the kibosh from the French club and its European satellites.

But this Grand Prix is not working out as satisfactorily as anticipated—France with a preponderance of the entry list has met defeat twice in three years, and the one to-day is a crusher. Automobile sport is most uncertain—and, alas! it is grounded in commercialism. No longer do the multi-millionaires pay the bills and drive the cars. Now 'tis the maker who pays the freight—with rare exceptions—and the expenses are heavy when three entries become advisable, once the plunge is made. France is the only European country which now conducts a real big race, and to hold it with the inevitable risk of losing prestige is chilling the ardor even of those who think racing a good advertisement for the industry.

But there is also sorrow of a different sort to-night, and the startling death of Cissac and his mechanician has called attention to the great risks now associated with high speed contests. Tires can only stand so much, and the Dieppe circuit has been unusually severe this time on the wind-shod shoes of the hard-driven autos. Stretches of road there were which hacked tires as though the rubber was pulp, and it became the usual thing to have car after car limp to the replenishment depots in front of the grandstands and take on fresh supplies of pneumatics.

Lautenschlager, the Mercedes Winner.

As was demonstrated in the practice work, the limiting of the piston area so that a four-cylinder had 155 mm. and a six-cylinder 127 mm. per cylinder did not prevent an increase in the speed. Last year fuel consumption—30 liters for 100 kilometers—was the basis of limitation. Nazzaro then accomplished an average of 70.61 miles per hour for the entire run.

For a single round to-day Salzer on a Mercedes averaged 78.5 miles, and if tire troubles had not multiplied, the winner's average of 69.5 for the entire distance would have been miles ahead of a year ago. Another factor which interfered with the speed was the inadequate tarring of the first day did not improve places reeked with dust that penetrated the goggles of the drivers and made them suffer intensely and use no small amount of caution. The voiturettes race of the first day did not improve the course, which, however, did not impress me any too favorably during a Sunday journey over it. Excellent stretches there were, but one also encountered rough spots and more dust than I have ever seen on any Vanderbilt course. It is only fair to say that thousands of autos visited the triangle on the days preceding the races and unquestionably were greatly responsible for its disappointing condition.

But there is a widespread feeling to-night evident that high speed racing has reached its climax. France can hardly quit now with two successive defeats chalked up against her, and this means that there must be a 1909 race at least. After that—well, one can't state positively. Charles Jarrott even ventures to say that it is now ended, but the English have not been keen on the road racing proposition since the Gordon Bennett in Ireland. Marquis De Dion asks: "What's the use of it? It does not prove anything except that it is easy to endanger life." The Marquis, however, has been opposed to racing for some time, though it is to be noted that he no longer stands practically alone in his attitude among the French builders of prominence.

There were 48 starters, 23 of them being French, and 25 supplied by other nations. There were 23 finishers, only 10 of which were furnished by the home country. Germany put in 9 cars

and finished with 7. Italy had 6 starters and 2 finishers; Belgium had 3 starters, 2 finishers; England had 6 starters, 2 finishers.

America sought experience and did not hope a single instant for victory. The Thomas entry was known to be nothing more or less than a partially remodeled stock car, of less power than any other racer engaged, and participating for the purpose of gaining experience for future use and incidentally to demonstrate reliability. Harry Houpt had a hard task cut out for him from the moment he landed in Dieppe and took charge of the Thomas interests. He labored indefatigably to overcome hurried preparation and the usual handicaps following in the train of doing things in a country where the American way is at times impossible and impracticable. And the Thomas started in its turn, persistently pursued its progress for four rounds, after suffering from tire difficulties in profusion. Then a leaky gasoline tank on the fifth round brought Strang's ride to its conclusion. Many others had fallen by the wayside in the meantime—some of them possessing international reputations.

One cannot resist asking, however, as to whether it is worth while for the American maker to seek international racing glory in Europe. There will be no market of much account for American cars in Europe for years to come—if ever—and unless an American can "cash in" a European victory, what is the good of seeking a useless asset. Furthermore, the work of preparation must be thorough and planned not less than a year in advance.

And it might be said right here that several European makers who have been much in evidence heretofore in American racing are doing some careful calculation as to whether it is worth while. Since they race their cars for advertising purposes, they are inclined to compete in the most important event, which, of course, means the Vanderbilt cup. If through some hocus-pocus or other, this is impossible, they are not charmed with the idea of going any distance from New York City, even to accommodate a club which has been over friendly to foreign makers generally and only as recently as last winter had the French ambassador as the guest of honor at its annual dinner. But the present administration of the Automobile Club of America prizes highly its "foreign relations," to "protect" which Dave Hennen Morris, formerly president—and a good one, too—came over for the Grand Prix and a session of the "Recognized Clubs," in the running of which figures dictatorially Rene de Knyff, managing director of a French automobile company and chairman of the racing board of the French club. Of course, the "Clubs" will stick by the A. C. A. through thick and thin, and thereby hangs a tale which will be set forth in these columns in due course of time. Self-preservation is said to be the first law of Nature—and also of "national" automobile clubs. But 'tis good guessing that until America has a real voice and vote in the international proposition, there will be no acceptance by American makers of international racing conditions. If the foreign makers do not fancy our rules, then they can stay away—or compete in a special event arranged for them by their particular friend, the automobile club of "foreign relations" fame. But, alas! Now they are not sure at all that it is remunerative to race cars in America, for the American market is not what it once was for foreign cars.

W. K. Vanderbilt, Jr., was among those who saw the race, and incidentally he made clear to those who cared to know that it is the A. A. A. and not the A. C. A. which promotes the Vanderbilt Cup race and controls racing in America. Robert Graves, who has a Mercedes entry in the Vanderbilt and may have an American candidate also, was another in evidence who made known the American situation, which only now is being understood for the first time. John S. Worden, who drove in the 1905 Vanderbilt, was to be seen. He now lives at Nice. James Butler, owner of the Empire City track, enjoyed the sport immensely, and regretted that the "stars and stripes" didn't have more speed. Cortlandt Field Bishop, president of the Aero Club of America; J. C. McCoy, also of aeronautical fame; J. Harvey Lanning, of the Wilkes-Barre Automobile Club; Hart O. Berg, now foreign manager of the Wright brothers; and A. E. Lumsden, London manager of the B. F. Goodrich Company, were among the American contingent in Dieppe which witnessed the race.

A COMPLETE TABLE SHOWING THE TIMES MADE BY EACH CAR THROUGHOUT THE CONTEST.

No.	Car	Driver	1st Round	2nd Round	3rd Round	4th Round	5th Round	6th Round	7th Round	8th Round	9th Round	10th Round

General View of the Long Grand Stand, Showing the Replenishing Boxes Alongside the Road and the Asphalt Strip.

HOW THE GRAND PRIX WAS RUN AND WON BY THE GERMANS

By W. F. BRADLEY.

DIEPPE, July 7.—At 6 o'clock promptly, the boom of a cannon announced the approaching start of the race. One minute later and Darius Resta, England's race track champion, had shot over the line on the long, green Austin, the leader in what everybody was convinced would be the most keenly disputed automobile race Europe had ever seen. One minute later, Poegge and his Mercedes had evoked the cheers of the strong German element and was racing down the road after the Britisher. Pierron and the Motobloc passed almost unnoticed. Then five of the best drivers Europe can boast stood in line in this order: Szisz, Duray, Hemery, Lancia, and Thery. Szisz and his low built, elegant-looking Renault commanded a hearty cheer; Duray was not lacking in favoritism, but Hemery was treated to cold silence; Lancia, the unlucky, still showed that he was popular with race crowds, but it remained to Thery, returned to the racing game and the Brasier team after an absence of two years, to receive the most prolonged and hearty roar accorded any of the well-known racing favorites.

Stricker, the Yankee driver of a six-cylinder Porthos, was followed by Opel, the German, on his own machine. Behind was little Rigal on the big, blue Bayard-Clement, one of the fastest cars in the race according to preliminary tests. Next followed Cagno, Itala; Harrison, Weigel; and Jenatzy, Mors.

Then came the turn of No. 15 Thomas, with Strang at the wheel. Though the first and second gears had locked on the shaft while driving up to the starting line, Strang went away in excellent style, and was certainly a long way from being the slowest starter among a group of very fast cars.

Thirty-three other cars followed, every start being made with a dash and vim that revealed a determination to conquer in a hard, long struggle. Instead of the 49 cars originally entered, the actual starters were one less, the third Mors, originally intended for Charles Jarrott, but later turned over to a factory mechanic, being absent on account of a break-up while on a previous practice spin. The three English Weigels, too, had at one time been doubtful starters, an accident two days before which cost the life of one of their friends, an amateur driving the 1907 Renault of Szisz, completely disorganizing the team. The final settlement was that Weigel, the owner and builder of the three cars, withdrew from the race and was replaced by a tester.

The number of cars being large and the road reported rather loose and dusty in places, special precautions had been taken by most of the drivers. A large proportion had their faces painted, and complete masks with but an opening for the mouth and eyes were used by many. Duray had a light wire gauze screen fitted up from the right hand side of his dashboard as a pre-

Lautenschlager, the Victorious German, in Full Mercedes Flight Near Ancourt.—Taking a Turn with Consideration for Tires.

Hemery Preparing Benz for Final Round.

ventative against flying stones. His breast was as usual adorned with Lorraine-Dietrich charms, and on the right of the chassis was a notice in English and German "Dangerous to lean out."

First Round Over 78 Miles an Hour.

A second after the Benz car driven by Erle had been sent away, the first car to finish the round roared past the grandstand at a speed of about seventy miles an hour. It was Poegge on the Mercedes, who had succeeded in passing the Englishman Resta, sent away one minute ahead of him. Before No. 48 Germain, driven by Perpere, had closed the starts, Szisz, Hemery, Lancia, Duray, and Thery had finished their first round, the excitement as the last cars left and the leading cars finished their initial trip being intense.

Thery on the Brasier and Szisz on the Renault each covered the first round in 37:06, which is at the rate of slightly over 77 miles an hour. Thus last year's record round, made by Nazzaro in 38:16, or at the rate of 75 miles an hour, was beaten before the struggle had been in progress an hour. But even better time was to be made, for when Salzer roared past the grandstands on his Mercedes he had performed the stupendous feat of covering the 47.8 miles of road, with a standing start, in 36:31, which works out at the rate of 78.5 miles an hour. The limited bore cars had already proved themselves faster than their unfettered predecessors of 1907 and 1906.

Wagner, who had started fortieth on the list, beat his team mate Lancia and his rival Thery by covering the first round in 37:13. Bablot of the Brasier car, made the second fastest time on the initial round by putting up figures of 36:40. The one other to break last year's record was Hemery's Benz, in 37:55.

Lancia's brilliant work was only of short duration. After passing the tape at the end of his initial round the bulky Italian pulled in his car at the appointed tire station, jumped off hurriedly and lifted the bonnet. There was a quick examination, a shrug of the shoulders, then ten minutes' leisurely work terminated by the car being pushed off the track into the paddock at the rear of the grandstands. Lancia's opportunity of winning had been lost through the breaking of the water pump shaft.

Hanriot (Benz) Turning at Londinieres.

Jenatzy ran in on completing his round in order to change the tires in the manufacture of which he is interested. The work was done while the engine was running, a quantity of oil taken in, and the Mors car was off again.

Nazzaro had secured first place by the time the second round was completed, and was followed at an interval of exactly one minute by Lautenschlager, the newcomer to the Mercedes racing team. Thery had third place, Wagner fourth, Duray fifth, and Minoia, the De Dietrich driver, sixth. There was surprise that Szisz, who had tied with Thery for third place on the initial round, should not come round in his expected place. The absence was soon explained, for the Renault came slowly up the road minus its left rear tire and rim.

Szisz Disabled Because of Another's Accident.

In a few hurried words the situation was explained; on approaching the hairpin turn near the Dieppe end of the course, and less than a mile from the grandstand, Szisz was suddenly flagged to stop, Poegge's Mercedes having missed the turn and gone into the fence. Under the influence of the harsh application of the brakes tire and rim flew off the wheel, the car meanwhile continuing to run along on the fixed wheel for a distance of several hundred yards. When the racer was finally pulled up it was found that the two flanges had been so flattened that it was impossible to put on a new rim. The car was run up to the grandstand on the rim, pulled up in front of its tire station, examined by Louis Renault and Chairman Rene de Knyff, then ordered to be pushed off the course, the regulations forbidding the changing of a wheel and a continuation of the race being impossible under any other conditions.

There were more surprises and disappointments in store, for the entire Dietrich team of Duray, Rougier, and Minoia soon was put out of the running in quick succession. Duray, after covering two rounds, got back to the stand on foot and made the statement that his clutch collar had seized up. Rougier's failure was magneto trouble; of Minoia nothing was heard.

Salzer, the acrobatic Mercedes driver, who furnished the record round, completed a second trip round the triangle, then disappeared. Gaubert, one of the Porthos drivers, was unable to get round one of the bends with his long wheelbase car in a satisfactory manner, ran into a wall, smashed his wheel and retired. Simons, his team mate on No. 42 Porthos, met with a similar fate during the second round. Shannon of the Weigel and Piacenza of the Itala each failed after a single round.

Wagner and Nazzaro Join the Disabled.

It was early seen that the struggle was going to be a severe one between the Benz, Mercedes, and Brasier teams, with Bayard-Clement and Renault as runners-up. On the third round Wagner (Fiat) got first place, followed by Hemery (Benz), Lautenschlager (Mercedes), Nazzaro (Fiat), and Thery (Brazier).

The proud position was not maintained for long, Wagner retiring on his fourth round, and at about the same time Nazzaro was reported as having abandoned, the trouble, according to his team mate Wagner, being also a broken crankshaft. Thus all three Fiat cars were out a third of the distance.

On the fourth round also Baras, the second Brasier driver, went out of the race as the result of the cams becoming loose on their keyways, the cams and shaft on the Brasier racers not being integral as on the touring car, in order to allow finer adjustments and changes. Laxen, the driver of No. 30 Weigel, skidded on a turn very early in the race and was unable thereafter to use any other than his third and fourth speeds. Later, while taking a turn at Eu during his third lap his car turned completely over, without, however, any serious injury to the two men.

Jenatzy, Now a Mors Pilot, Replenishing.

Hemery and His German Benz Obtain Lead.

On the completion of the fourth round Hemery, the French driver of the German Benz, was in first position, with a lead of two minutes on Lautenschlager, the Mercedes conductor. Hanriot, also on a Benz, was third, with Thery running a very close fourth. Heath, who was driving his Panhard with remarkable dash, was in fifth place, Bablot on the Brasier in sixth, Cissac's Panhard seventh, and Hautvast, Clement, eighth.

Owing partly to the forcing of the pace, and in a certain measure to the fact that the road was exceptionally hard, tire trouble was abundant. At the end of the first, second, and fourth rounds Strang put into his station to change a punctured tire and take on replacements for those lost on the course. Guichard, the mechanician of the Thomas car, showed remarkable agility by climbing out to the bracket behind the gasoline tank and unstrapping the tires as the car was running down to the station. With the single fastener Michelin rim and prompt responses from those at the tire and gasoline station the changes were all made with remarkable speed.

Tire Changing Became an Important Factor.

Tire changing being an important factor in the race, it was interesting to notice the various arrangements adopted and methods of work of the different teams installed in the dugout "ravitaillement." Renault and Panhard both had pneumatic jacks which could be put under the axle of the car and the vehicle raised in less time than it often took to place the old type in position. Dietrich had a long double lever about seven feet in length by which the entire front or rear could be lifted off the ground on one pull. Half a dozen firms maintained their gasoline under pressure in a large tank with a long connection.

The Englishmen at the Austin stand distinguished themselves by unusual slowness in making tire changes, filling tanks, etc., sometimes as much as five or six minutes being lost waiting for appliances which ought to have been at hand or loitering around for no apparent reason. In view of the fact that the cars were running excellently it was hard to understand such indifference.

Cissac's Last Appearance Before His Fatality.

Lautenschlager to the Fore in the Fifth.

During the fifth round Lautenschlager on the Mercedes managed to wrest first place from Hemery on the Benz and to secure for himself a margin of three minutes. Hemery took second place, his companion Hanriot retained third, and Thery kept in fourth position. There was now something like consternation in the French camp, for unless Thery could wear down the three fast cars in front of him victory was assured to Germany, and, in any case, the home industry would be poorly represented in the first half dozen. Heath and Cissac, each on a Panhard, were running well, but could not be expected to secure first place except by accident, and the two Renaults handled by Caillois and Dimitri were too far down to get to the front.

On the termination of the sixth round the Mercedes-Benz duel was still in progress, Lautenschlager leading by four minutes on Hemery and five minutes on Hanriot (Benz). Thery, in fourth position, handled his car magnificently, the big blue Brasier whizzing past the grandstand as if on rails, the veteran driver slipping from third to fourth speed at a fixed spot opposite the grandstand with a sharp touch of the lever.

Thomas and Its Leaky Gasoline Tank.

While the leaders were on their sixth round Strang pulled into the station at the end of his fourth round with the gasoline tank leaking badly. It was quickly filled, fresh tires taken, and a start made for a fifth round, Strang believing that he could run on gravity with his large supply and keep sufficient fuel to get around the course. In other respects the car had shown satisfaction, and, though not as fast as the Germans and French, seemed capable of going the entire distance.

Hemery managed to close up on Lautenschlager during the seventh round until the difference between the two men was barely a minute. Hanriot was four minutes behind the leading Mercedes, and Thery was ten minutes in the rear. During this round Hemery was struck in the eye by a flying stone which broke his goggles and caused some of the glass to enter the eye. Though suffering intensely and only seeing with one eye, the Frenchman stubbornly refused to allow his car to be taken over by a reserve driver. One side of his head was horribly swollen, the effect of the tarred surface and dust aggravated the evil, but still the killing pace was maintained. Lautenschlager managed to draw away from Hemery one minute and from Thery four minutes, but the respective positions of the four leaders remained unchanged during the eighth round.

Victorious Mercedes on Its Final Round.

Down in the tire and gasoline pit the Mercedes assistants were in a frenzy of excitement as the last round commenced with Lautenschlager in the lead. Before starting off on what promised to give him the victory the German ran in to change front and rear tires, replacing the smooth one by non-skids, and to take a hasty drink of coffee. With a roar from a hundred German throats the white Mercedes was off again in pursuit of Hemery, who, having started thirty minutes earlier, was still leading in position but not in time.

Hemery finished first with his left rear tire flat and his left eye probably useless for the rest of his life. But he had started earlier than Lautenschlager carrying No. 35, and had to be content with second place, nine minutes behind the Mercedes. Hanriot, who had struggled hard to wrest second place from his mate, had to accept third, less than one minute behind.

At the commencement of the last round fourth place had seemed certain for Thery; it was even imagined by his supporters that a supreme effort could be made to run up to third or second position, first place being manifestly beyond his reach

Thery (Brasier), Whose Star Was Dimmed.

except in case of accident. Henry Brasier wandered up and down the track with a worried look on his face and glancing every few minutes at the announcement board for news of the passage of his crack driver. Louis Renault strode up and down nervously and anxiously, stopping now and again to explain how Caillois had been delayed by trouble with his dismountable rims. The minutes passed, but no reports came in of the approach of Thery. The time necessary to secure first place elapsed, then the cruel truth burst upon them that Thery, long looked upon as superior to breakdowns and accidents, had met with defeat. It was not, however, until an hour later that it was learned that the Brasier car had completely broken down during the last round, a cylinder having cracked.

Rigal, who earlier had been delayed by trouble with his dismountable rims, made a supreme effort and finally brought his Bayard-Clement into the fourth place vacated by Thery. Poegge, who had undone the first Renault, brought his Mercedes into fifth place; Joerns on the Opel secured sixth place, Erle on the Benz took seventh, and Dimitri, Renault, was classed eighth.

Heath, First Vanderbilt Winner, Unofficially Ninth.

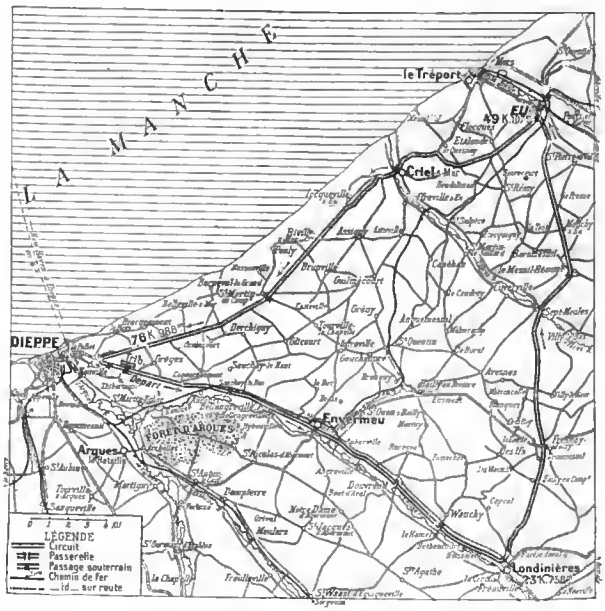
Though George Heath was unable to officially finish the race, his car took ninth position. The winner of the first Vanderbilt race had suffered severely from the effects of the tar on his eyes all through the race. At the end of the ninth round he declared that it was impossible for him to continue, and immediately Artois, who was in the gasoline station, jumped onto the road and was off with the car. During the final round the mechanic was thrown out of the car on one of the turns, the rear wheel passing over his left hand and severely crushing it.

Twenty-three out of the 48 starters finished the race, the only teams complete at the end being Benz with all three cars well placed and Mors with their two cars, sixteenth and seventeenth.

Henry Fournier, one of the several veterans who have returned to racing this year after a long absence, was delayed by tire and slight mechanical trouble early in the race, and later suffered intensely from the action of the tar on his eyes. On completing the course in twentieth position he had to be led away to the doctor, his eyesight having temporarily left him. Moore-Brabazon and Resta, the English drivers, were similarly in a pitiful condition, while Heath had to take to bed.

The Double Fatality of the Race.

A little time after the winner had been announced, and while the stands were comparatively empty, the rumor spread abroad



Map of the Triangular Course.

that Cissac, the Panhard driver who had set out in sixth position to make his ninth round, had met with a serious accident. For at least an hour no exact information was available, but about 3 o'clock the sad truth was made known that both driver and mechanic had been killed. The real cause of the disaster is not quite clear, for the only eye witness was a soldier who is able to supply but meager details. The probability is that while running on a straightaway between 80 and 90 miles an hour a front tire burst or the steering gear broke.

How Cissac Met His Unhappy End.

The spot where the accident took place was at Sept Meules, the road slightly descending and perfectly straight. The soldier declares that a tire burst, the machine swerved suddenly to one side, struck two trees, bounded to the opposite side of the road, then rolled over on itself two or three times. Cissac, who was 31 years of age, had graduated from the bicycle to the motorcycle, and from the motorcycle to the voiturette. The race in which he found his death is the first big automobile event in which he had participated.

Fournier (Italia), Who Fought Unsuccessfully.

STRANG TELLS THE STORY OF THE AMERICAN ENTRANT

DIEPPE, July 7.—"When I was given the start in fifteenth position with the Thomas car," declared Louis Strang to THE AUTOMOBILE representative, "I had nöt any hopes of capturing the French Grand Prix. Against the 120-horsepower French, German and Italian racers which had been practicing on the course for months we could not expect to give more than a regularity display with our modest 90-horsepower car, which has never been on the course before.

Louis Strang.

"On the first round we ran without incident as far as Sept Meules, about half the distance. Here at the very spot where Gaubert overturned later on his Porthos, the Thomas skidded and blew out a tire. With the new Michelin rim it was but a matter of a minute or so to slip on a new tire and get under way again. We ran around to the grandstand, picked up a new tire to replace the burst one, and two minutes later were away again in good shape.

"On the second round we unluckily blew out a tire, and a few miles farther on lost off the top of our carbureter. One of the women spectators gave us a handkerchief with which we improvised a carbureter top that allowed us to run to the grandstand where the proper part could be obtained. Guichard, who rode with me as mechanic, did everything in his power to save time on the numerous occasions we had to stop to change tires. As we were getting near the grandstand he would leave his seat and scramble out behind the gasoline tank, where the tires were rung in a shallow pan, in order to have the straps unfastened by the time we pulled up. The spectators appeared to think that he had to get to the rear in order to hold the tank together or keep the tires in position.

Where the Thomas Ended Its Fight with a Leaking Gasoline Tank.

"During the first round all the cars ran at their highest possible speed, at an excessive speed in fact, for they were not able to maintain the killing pace. Our time on the Thomas was 54:34, compared with 36:31 for the fastest car; an Itala finished behind us and one car went out through accident. On the second round, owing to the loss of the top of our carbureter, our time was slower, the lap being covered in 1:02:56. Cagno's Itala was slower than we, and eleven fell out of the running altogether.

"On the third round we blew out a tire at Mesnil-Reaume, causing a delay of a couple of minutes, and also on taking a sharp turn at high speed threw Guichard out of the car. My mechanic was fortunately thrown clear of the wheels, and on picking himself up found he was none the worse for his mishap. Stopping the car and recranking the engine caused another two minutes' delay, but notwithstanding this we finished the round in 58 minutes, being faster than Landon on the Mors, Stricker on the Porthos, Gabriel on Bayard-Clement, Opel on Opel, Dimitri on the Renault, and Fornier on the Itala.

"The only exciting incident of the race, for us at any rate, occurred near Griel on our fourth round. At this spot a racing car which I believed to be one of the English Weigels had struck a tree and overturned, the tree being thrown across the road and the car to one side. The commissioners had called the soldiers to their aid in removing the tree, and in the meantime had flagged all cars. Just as we got there the obstruction had been removed, though two cars still stood on the roadside. The forward car was some French machine, the number of which I could not distinguish, the rear one was Fournier's Itala.

"When I saw the obstruction I was running wide open, the machine romping along at about 80 miles an hour, a speed that made it impossible for me to shut down in time. There was room for me to pass, for Fournier was standing behind the French car, and I consequently pulled out more to the left and rushed ahead. As I was approaching, however, Fournier hastily looked round, evidently thought he had time to get ahead of the French car before I arrived, and started to move along. He had either overestimated his power of getting away or had miscalculated my speed, for when the Thomas ran up we were all three abreast on a narrow road. Fournier pulled in to the standing car as closely as possible and I swerved out on to the grassy bank, went thumping along for several hundred yards and pulled up half a mile ahead with a burst tire. As Fournier went past me he indicated by signs that he had made a mistake in cutting in on me. Fortunately there was no other damage than the burst tire, but the escape is one of the closest I have ever had during my racing career. On this round our time was 57:01.

"There had been no trouble whatever with the engine; the only occasion on which we had lifted the bonnet was to replace the top of the carbureter. The first and second gears had seized just before we started in the race, but this did not hold us down in the least, it being possible to start away on the third and take all the hills on this gear.

"While finishing the fourth round Guichard discovered that the gasoline tank was leaking. We stopped at the tire station, cut out the pressure in order to preserve it for the oil and prepared to run on gravity. As the tank was exceptionally large we imagined it would be possible to run in this way and fill up each round. Instructions were therefore given to the helpers to be ready to give us gasoline on every lap.

"We ran along without a miss until we reached Londinieres, when, just as we got into the dangerous 'S' turn where the Renault and the Brasier turned over last year the gasoline ceased to flow to the carbureter. Coming down the winding road the tremendous thumping or the roll of the gasoline as it swung from one side of the tank to the other had strained the end still further until the fuel was running out in a steady stream. The 'S' turn is followed by a long winding ascent that we could not possibly climb with such a low level of fuel. The car was then standing in a very dangerous position owing to the peculiar nature of the bend and the high banking; racers coming round the corner were in great danger of running into it. We therefore applied to a commissaire for help to push it into a more exposed position. A dozen soldiers were sent on the road to help push the car slightly up the hill. We had a car perfectly fit in every respect except for the leaky tank."

SINGLE-CYLINDER 50-MILES-AN-HOUR VOITURETTE WINNER

DIEPPE, July 6.—If there had been a little more internationalism in the event and no momentous Grand Prix to overshadow it, the voiturette race held to-day would have stood forth as an excellent sporting affair. Unfortunately all the starters, with the exception of two teams were supplied by home firms. Still more unfortunately for the foreign visitor and the casual automobilist, not more than ten per cent. of the drivers had ever been heard of in a racing capacity before, so that interest in the event was purely French.

The winner of the first voiturette Grand Prix was found in M. Guyot, who was the first to shoot over the starting line on a Delage one-lunger, and was the first to finish the race.

Six times in succession, without a stop of any kind whatever, the little single-cylinder car of less than four inches bore traveled round the triangle at an average speed of slightly more than 50 miles an hour. To be exact, his time for the 285.2 miles was 5:45:30 1-5, which works out at the rate of 50.02 miles an hour. Two years ago the suggestion of such a speed would have been laughed at as an impossibility; to-day it was expected, and when it was made, it was no surprise.

Second place went to Naudin, one of the favorites, who finished on his Sizaire-Naudin single cylinder car seven minutes behind the winner. Third and fourth places went to Lion Peugeot, and fifth again to Delage. All three Delage cars finished, and finished so well that they secured the regularity prize with 18 points. Lion Peugeot was second best on team performance with 22 points; Sizaire-Naudin coming tbird with 29 points. No other teams made all six rounds of the course complete.

Guyot and Delage Voiturette Winner.

The result of to-day's race has been a complete triumpb for the single-cylinder car, which has been revived with considerable enthusiasm in France during the past two years. The few two-cylinders failed to make a showing. Isotta-Fraschini, Martini, and Rolland-Pilain each furnished three four-cylinder cars of the very highest class which looked good, ran well and sounded healthy, but which failed altogether to show the speed abilities of the more noisy single cylinders. For very small bores there are considerable mechanical difficulties in the construction of four-cylinder engines, and it is certain that with a limited cylinder area more power can be obtained from a single than from a multiple cylinder engine. In their own way the baby racers were every whit as regular as any of the 100-horsepower flyers which have been put on a European circuit and afforded as close finishes as will probably be seen in the greater race to-morrow.

There was some disappointment through the failure of the favorite team, Sizaire-Naudin, to make a more satisfactory showing. After winning the voiturette races two years in succession, Sizaire-Naudin built three ingenious and remarkably fine cars which were certainly the fastest of the lot on a short stretch, but which failed to give the best results on the long run. It was a severe weeding out test that the baby racers were put to, the hard, well-beaten-down road surface subjecting the small cars to severe vibration that soon told its tale in weakened mechanism. Before half the race was over there were a number of cars which could be seen struggling along painfully, the terrible strain of fifty miles an hour shaking the life out of them and making it impossible to continue.

Accidents were five in number, due doubtless to the inexperience of the drivers, but ending without any very serious results. Martin, driving the No. 7 Demesteer, left the road, overturned, was wounded on the head, and had to be carricd to Eu hospital; the Truffault, of shock absorber fame, ran into the bridge at Ancourt, the result being a severe shaking for the driver and a shortened career for thc car; No. 24 Guillemin-le-Gui turned over on a bend; an Aries smashed a wheel and ended its racing life in a field; No. 50 Martini was ditched by Driver Sanvico. Considering the number of cars and the fact that many of the drivers had not previously been in a pure speed contest, the list of accidents is satisfactorily small. The public was too well protected by stout barricades and lines of soldiers to ever be in any danger.

H. S. HOUPT ON THE RACE.

"Soon after reaching Dieppe," said Harry S. Houpt, manager of the Thomas entry, "I realized the very thorough manner in which the French, German, and Italian firms prepare for racing, and also saw that even with engine limitations their 1908 cars were faster than those of the previous year. With power well under a hundred and all of our rivals over the century mark, it only required slight calculation to understand how meager were our chances of being in the first dozen.

"Bue we went to work determined to do the best possible with our remodeled stock car, hoping to demonstrate reliability if nothing more. While the Thomas was pugnaciously covering four laps, interrupted by frequent tire troubles, there were some noted cars and drivers which disappeared from the scene. If Strang's gasoline tank had not been wrenched and sprung a leak I am confident that we would have finished the ten laps inside the time limit.

"We have learned much of the needs in racing an American car in Europe, and our experience will be very valuable."

SUMMARY OF THE VOITURETTE RACE.

No.	Car	Engine	Driver	Time
	DELAGE	1 cylinder De Dion.	Guyot	5:45:30 1/5
2	SIZAIRE-NAUDIN	1 cylinder	Naudin	5:52:06 3/5
3	LION PEUGEOT	1 cylinder	Goux	5:58:00 1/5
4	LION PEUGEOT	1 cylinder	Baillot	6:05:25
5	DELAGE	1 cylinder	Thomas	6:18:50
6	THIEULIN	1 cylinder	Viton	6:26:44
7	ALCYON	1 cylinder	Barriaux	6:32:37
8	ISOTTA-FRASCHINI	4 cylinders	Mazerati	6:36:39
9	SIZAIRE-NAUDIN	1 cylinder	Lebonc	6:36:57
10	MARTINI	4 cylinders	Beck	6:37:28 1/5
11	THIEULIN	1 cylinder	Schwoot	6:38:40 3/5
12	DELAGE	1 cylinder	Lucas	6:38:52
13	WERNER	1 cylinder	Vallee	6:40:37
14	ISOTTA-FRASCHINI	4 cylinders	Buzio	6:42:38
15	LION PEUGEOT	1 cylinder	Giuppone	6:50:40
16	ROLLAND PILAIN	4 cylinders	Louison	6:51:28
17	GUILLEMIN-LE-GUI	1 cylinder	D'Avaray	6:58:46
18	SIZAIRE-NAUDIN	1 cylinder	Sizaire	6:58:48
19	WERNER	1 cylinder	Molin	7:02:02
20	OASI GREGOIRE	2 cylinders	Gaste	7:17:03

THE UNIT SYSTEM OF POWER TRANSMISSION

By FRANK BEEMER, Member Society of Automobile Engineers.

PERHAPS one of the most serious problems that confronts the average automobile engineer in America and Europe to-day is the best and most economical way of transmitting power. There have been a large number of experiments made in various types which are commonly known as the transmission axle, the results of which are in favor of this so-called unit system. There are quite a number of reasons why this system should and does save considerable power.

First—That it requires but one universal joint, either single or double. This is one of the points which, most engineers agree, consumes considerable power, while the driving at various angles of the propeller or cardan shaft, through two or three universal joints is also very undesirable. This transmission applied on the rear axle allows the universal joint to be placed immediately back of the clutch and a considerable distance forward of the point where it would be placed in a car, with the transmission carried on the sub-frame, thus reducing the angularity of the propeller shaft to a minimum, and in most cases bringing it practically on a straight line with the crankshaft.

Second—The transmission and differential mechanism being placed in a single housing makes it very easy to have it in perfect alignment; this is one of the features that has proven from all experiments, to be the principal factor in the saving of power. It is quite necessary, and has been recommended by all ball and roller-bearing authorities, that to obtain the best results from the use of any type of anti-friction bearing it is absolutely necessary that the bearings be in perfect alignment. This question has been taken up in a very practical way, and it has been found that the unit system of power transmission permits freer action to the bearings, thus reducing the effect of the abnormal shocks and vibration to the bearings.

Efficiency Is Greatly Increased.

The tests that have been made of this system of transmitting power show a saving of from 16 to 20 per cent. of the power applied, or, in other words, it utilizes this much more power at the driving wheels, in the ordinary designs, this amount being consumed by universal joints, angularity of cardan shaft, disalignment of bearings, and many other sources of imperfection which are more easily taken care of in the transmission type of axle than in the various types of plain axles commonly used.

The automobile buyer of to-day in most cases considers very carefully the simplicity of the car, more than its style or appearance. He is not repeating the troubles which were experienced in the early days of automobiling, when many purchasers endeavored to secure a car which, in plain language, consisted of the greatest number of pieces for the money. It is a well-known fact that where the acme of simplicity lies is the maximum of durability and that means a minimum number of parts.

The automobile equipped with the unit system of power transmission has been taken by many reliable engineers as a parallel to the direct-connected power set or unit found in the latest power plants, having the engine, which corresponds to the automobile motor, and the generator, which is the equivalent of the transmission devices. This has been found to be the most practical and economical method of producing electricity, and it is this idea, carried out, as herein described, that forms one of the most economical ways of transmitting the power of an automobile motor to the road wheels through a system based on mechanical principles. It should appeal to most engineers as being one of the best and most practical methods of obtaining the result desired, as it shows a very high efficiency.

The saving of power, as above stated, is based principally upon hill-climbing tests which were made with several cars equipped with the unit transmission system. I have been present at a number of these tests, and have driven some of these cars, which were equipped with the transmission on the sub-frame, and have noted carefully the working of all parts of the car. I have also taken the same cars equipped with the transmission axle and in repeating the same tests have found that there is a very considerable increase in both speed and ease with which the motor will handle the car on the same hills.

I have also made certain speed tests with a car, with all parts in good condition. The motor at its very best was unable to secure on good roads more than 40 to 45 miles per hour, while the same car equipped with the transmission axle and with all conditions as nearly alike as possible, would develop, with ease, 55 miles and even as much as 60 miles per hour. These and other efficiency tests tend to prove that the unit system of power transmission is without question one of the long-looked-for improvements in automobile design.

There are a number of arguments advanced in favor of the side chain drive for heavy cars. A car equipped with this drive, all adjustments being as correct as they were when leaving the manufacturer's hands, or as they were intended to be by the designing engineer, will prove efficient to a certain degree. There are, however, a number of annoyances connected with this system of propelling a vehicle that are very unpleasant, the principal one being the noise caused by the chains. It is essential, in this design, to have what is commonly called a radius rod to insure the proper distance between the centers of the sprockets. These are frequently adjusted to different distances, causing the chain to ride on the side of the sprocket, adding undue wear.

Protection a Most Important Factor.

There are a large number of cars equipped with this system that are not provided with cases to protect them from dust and dirt, which quickly cause an extreme amount of wear, as the accumulation of dirt upon these parts absorbs the oil or grease used for lubrication, and it is only a matter of a short time until the correct pitch of the sprocket and chains is destroyed, and it is at this time that the greatest inefficiency must arise. I have also noticed on a number of chain-driven cars, owing to the improper adjustments of the radius rods, that the rear axle does not set square or at right angles to the center of the car, which causes friction and undue strains upon the bearings, sprockets, chains, as well as excessive wear on the tires.

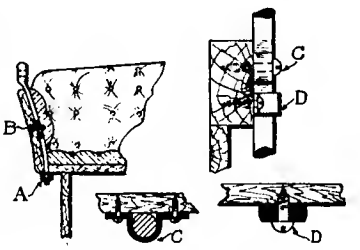
While we have a few of these discrepancies in the bevel-gear drive, it must be conceded that all the gears and other parts of the construction are properly protected from dust and dirt, and that at all times it has a sufficient amount of lubrication, which not only adds to the life of the parts, but reduces the friction, especially when working under excessive strains. Quite a large number, if not all, of these imperfections have been overcome in the unit transmission system, and the last, but not least, important feature of this system is the silence with which it transmits the power. I should say that it is physically impossible to obtain as quiet a running car with either the side-chain drive or with the car equipped with the transmission on the sub-frame and using the plain type axle, as it is with the unit system as has been herein described.

[The presentation of Mr. Beemer's paper at the Detroit meeting led to an interesting discussion during the course of which many points of value were brought out, the subject of power transmission on the automobile being one of vital import to the progressive designer. Among the engineers present were those who favored both sides of the question set forth as shown by their cars, some of which have adhered to the transmission axle and others to the subframe construction for several years. Written discussions on this very interesting subject were promised both *pro* and *con* and will appear later.—Ed.]

* Paper read before the Society of Automobile Engineers on the occasion of its Third Annual Summer meeting for 1908, held in Detroit, June 25-27.

GOOD POINTERS FOR THE AMATEUR REPAIRMAN

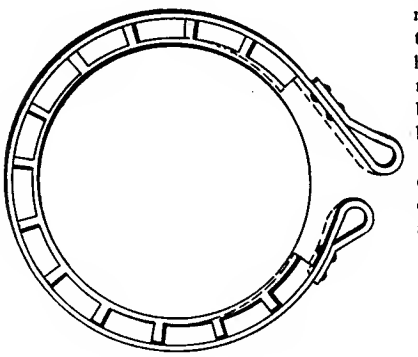
CAPE cart hood irons are sometimes attached to the front seat as illustrated, which indicates the appearance inside the arm of the front seat with the upholstery stripped away. The lower end of the iron goes through the overhanging part of the seat, and the nut, A, is on the outside. The iron is steadied by an ordinary wood screw, B, which goes into the framing of the arm. If the iron is curved as the sketch shows, there is a considerable leverage on B, tending to break it off. If it breaks, the free movement of the arm tears the upholstery. A permanent job can be made by drilling the hole through which B passes and putting in a slightly larger screw, C, and also putting on a strap, D, beneath it. This strap, D, then does the greater part of the work, and has the effect of causing any twist applied to the iron to be held by the screw, C, where it enters the wood, instead of exerting a leverage against it just under the head.



Details of Ironing for Cape Top.

About Fitting New Brake Bands.

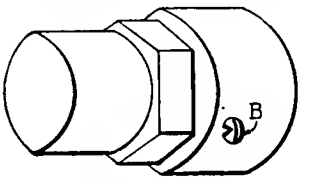
Brake bands having cast iron or brass shoes riveted to sheet steel bands expand and contract through a very small diameter, and when new they must be very carefully fitted to the brake drums or they will drag and heat. As one cannot depend on their being bent to precisely the right diameter, when they come from the factory, it will save time to test this point before putting them in place. This is easily done and with sufficient accuracy by drawing a circle on a board and laying the new bands over this circle to see how nearly they match. If the brake drums can be calipered the circle should be of the same diameter as the drums, and the bands should clear this circle somewhat as shown exaggeratcd in the illustration, since the principal bending of the bands will be at the bottom portion. This applies if the weight of the bands is supported clear of the drums. In some cars this is not the case and the upper portions of the shoes rest constantly on the drums. This requires these upper portions to be bent downward slightly, to almost their gripping position, as indicated by the dotted lines in the upper part of the illustration.

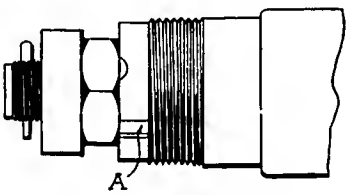


How the Brake Band Should Lie.

How to Lock a Loose Hub Cap.

A hub cap, particularly of a plain bearing car whose hubs are greased instead of oiled, will unscrew rather easily if its threads are a loose fit. This is particularly the case with the right-hand hub caps, since the viscosity of the grease results in a constant effort to unscrew them. As good a way as any to lock the cap is to chip the notch, A, in the flange of the bronze bushing in the hub, and to arrange a set screw in the cap to enter this notch. If the set screw is of the ordinary hardened sort and holds only by its own pressure, it is liable to shake loose some time or other. A better plan is to use a button head ¼-20 screw of ordinary steel, running the threads clear up to the head by means of a die. A notch is filed in the head of the screw, as shown at B, and the screw is cut off to such a length that the head will bottom on the cap when the end of the screw enters the notch A, then a burr is raised at B in the brass of the cap with a prick punch; thus the screw is secured against turning until it is wanted to do so. The same expedient is useful in many other places where it is desired to keep a screw from loosening in service.



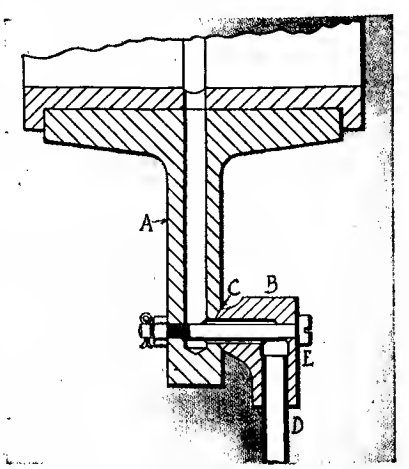


To Lock a Hub Cap in Place.

A Permanent Oil Pipe Connection.

The ordinary pipe fittings are not always reliable for oil and gasoline pipes subject to vibration, and where the failure of a connection would involve serious consequences, as in racing engines, a better form of connection is desirable. The illustration shows a special form of union devised by Crane & Whitman, of Bayonne, N. J., for important oil pipes. It is shown in service carrying oil to the under side of a main shaft bearing. The bottom cap A of the bearing is deeply ribbed and the oil duct is drilled in the rib. The connection itself takes the form of an L-shaped steel union B having a ground seat at C and brazed to the oil pipe at D. A special screw E passes through the union and is threaded into the further side of the rib. The oil goes around the screw, and a lock nut and cotter pin insure against coming loose under even the most strenuous conditions of service.

Should an oiler reservoir begin leaking where one of the oil leads attach to it, the only suitable solution is the immediate soldering of it. The use of adhesive tape will sometimes suffice for a time, but the vibration generally renders it a poor repair. A small soldering iron is a most valuable part of a repair kit, and with it a soldering repair can be made in less than 20 minutes. Oilers have been taken off, a fire built by the roadside and the soldering done in less than 15 minutes, but the amateur who has not been accustomed to handling a soldering iron can hardly expect to do as expeditious a job as this, for, though a simple tool, considerable knack is required.



To Prevent Breaking by Vibration.

LETTERS INTERESTING AND INSTRUCTIVE

THE IRREPRESSIBLE QUERY COMES UP AGAIN.

Editor THE AUTOMOBILE:

[1,464.]—Is there some engineer, designer or an authority on gasoline engines that will explain to a novice who is having his first experience with a single-cylinder car, in language that I can understand, why it is that a weak, or, as it is termed by some, a lean mixture, gives carbureter shots in a four-cycle engine?

Williamsport, Pa. NOVICE.

While the question does not appear to be aimed at us directly in this instance, we will attempt to assume one of the three roles mentioned and try to fulfil the qualifications as set forth. Bearing in mind that the mixture is the fuel of the engine, and that as in a stove, the character of the fuel influences its manner of burning, it will be evident that like poor wood, slaty coal, or other imperfect fuel, a weak mixture is a slow burner. This is point number one. Proportionate to the speed at which it is running, the motor has a certain sharply defined period of time in which it must complete each part of its cycle, if it is to operate satisfactorily. Should the parts of the cycle lap, or run over into one another, there is bound to be a hitch of some kind. The use of a very weak mixture causes just such a hitch by reason of the fact that it continues burning for some time after the completion of the part of the cycle during which it is supposed to function, *i. e.*, the power stroke. In fact, it is still burning when the inlet valve opens to take in a fresh charge, and as its burning in the cylinder maintains considerable pressure therein, the latter, on the lift of the inlet valve, escapes through it and the carbureter with a pop, exactly similar to that of an unmuffled exhaust except that it is weaker. The remedy is more gas or less air, or sometimes both, and to find out just how much of each is required, start the motor and very gradually cut down its gasoline supply at the needle valve of the carbureter until the motor begins to miss. Then as slowly increase the supply until the motor will run steadily and without missing on the minimum opening of the needle valve. Lock the latter in place. Then speed the motor up by opening the throttle and adjust the spring of the auxiliary intake on the carbureter until the motor is receiving sufficient air to enable it to run and develop plenty of power at all speeds. Our columns are thrown open to all and any who can be more explicit and still brief on the subject without going into technicalities or language not understood by the untechnical.

CAUSE OF A MYSTERIOUS NOISE.

Editor THE AUTOMOBILE:

[1,465.]—I own a Mitchell roadster. The car runs good on a level or up grade, but when I throw the clutch out with my foot there is a clashing noise somewhere. It seems as if the noise came from the transmission case, but I examined that while running and standing still, and I do not locate the noise. If you can help me with this through the columns of "Letters Interesting and Instructive," I will appreciate it. Yours very truly GOODWILL.

Greencastle, Ind.

It seems quite probable that the noise may be caused by the striking or interference of some of the parts of the clutch-operating mechanism, when the latter is worked to disengage the clutch, or again, some one of the parts may have loosened up sufficiently to permit it to strike the frame or a brace when the clutch is disengaged. Remove the footboards and watch the operation of the different parts between the pedal and clutch itself when operated with the car under way. If not in the operating mechanism, the trouble may probably be found to lie in the clutch itself, and this seems more likely, as contact by the spinning male member with some stationary part that has gotten out of place would be very apt to give rise to a noise similar to clashing. If any of our readers have had a similar experience on the same make of car, we would be pleased to learn of the remedy they applied.

PROPER SIZE OF EXHAUST MANIFOLD.

Editor THE AUTOMOBILE:

[1,466.]—I have an old four-cylinder engine, bore 4 1-4 inches, but the exhaust piping does not seem to be much more than 1 inch in diameter. It is a smooth, wrought-iron pipe and gets very hot when the engine has been running for any length of time. What is the cause of this and what can be done to remedy it?

Morristown, N. J. AUTOIST.

Both valves and manifolds that were very much too small for the bore of the motor constituted grave defects of some of the early multiple-cylinder automobile motors. The exhaust outlet, or manifold, that you speak of is very much too small for the size of the motor. It must be borne in mind that at the end of the power stroke the gases have been expanded to many times their original volume, so that a much larger pipe is required to carry them away quickly than is necessary to conduct the cold gas to the cylinder before explosion. These gases are still at a very high temperature when exhausted and unless disposed of very rapidly they naturally overheat anything that they come in contact with. Such a small manifold is also responsible for putting back pressure on the engine and causes a loss of power. It has been noticeable in the past few years that several designers have adopted exhaust manifolds cast with cooling flanges in order to insure as quick a drop in the temperature as possible. Some of these manifolds are really intended to act as mufflers and are made quite large. As a matter of fact, the size is only limited by the weight and appearance and the aim is usually to make the outlet as large as possible within these limits. If you will use a 2-inch wrought-iron pipe as a manifold it should make a great improvement and will certainly overcome the heating you speak of.

EXPLAINING THE "LEAD" GIVEN INLET VALVES.

Editor THE AUTOMOBILE:

[1,467.]—After having threshed the thing out at some length between ourselves, we have decided to refer the matter to a higher authority for settlement. The bone of contention is the practice of giving the inlet valve a "lead" in the modern high-speed automobile motor. My opponent contends that such a thing would not be possible as if the inlet valve were held open after the piston had passed the dead center and began to rise on the compression stroke a considerable part of the gases would naturally be forced back into the manifold and the power of the motor would accordingly be reduced. On the other hand, I contend that this is not so and that it is, moreover, quite common practice to give the inlet valves a rather considerable lead, as I have actually found this to be the case through examining the motors while in the course of dismounting or reassembling them. I have been told that this is done to insure the filling of the cylinder with the greatest amount of charge possible, and I believe that this is the reason, but do not know just why it should be so. Will you kindly shed a little light on the matter? HENRY EDGREN.

Fort Worth, Tex.

This appears to be a matter that forms quite a puzzle to many who are not familiar with the internal workings of the automobile motor. The higher the speed of the motor the greater the necessity for giving both the exhaust and the inlet valves what has come to be known as a "lead," in that they open before the completion of the particular part of the cycle that they are intended to perform. It must be borne in mind that time is required to set a thing in motion and to stop it, regardless of its form or weight, and this is true of a gas, which has inertia the same as other substances. Further, an appreciable period, though very short indeed, is required for the creation of the vacuum in the cylinder. The gas does not rush into the combustion chamber the moment the inlet valve opens; the piston must have traveled downward a bit before this takes place and the column of gas then rushing in attains an increasing velocity as the piston approaches the lower center. In fact, it is at its greatest

speed when the piston reaches the lower dead center so that the first part of its return travel has little or no effect on the incoming gas, which accordingly continues to pour into the cylinder, until the piston reaches a point on its upward stroke, where its compression is sufficient to overcome the inertia of the stream of gas, and this is the point at which most designers of high-speed engines set the inlet valve to close, thus permitting of the suction of the greatest possible quantity of fresh gas.

ADVANTAGES OF AN EXTREMELY LONG STROKE.

Editor THE AUTOMOBILE:

[1,468.]—I am an advocate of the horizontal opposed type of motor with its slow speed and easy action, and think it is ideal for automobile work. I have owned no less than three of the two-cylinder cars of this style and have never found that the lack of the extra cylinders handicapped me either in getting there or in arriving with all the speed that the law allows. I understand that both weight and lack of room are factors that enter into the question, but I would like to know why it would not be possible to greatly increase the length of the stroke of the average motor of this type, thus further reducing its speed and increasing its power at the same time. Would this not make a much more durable and easy running engine than is now the case and would its advantages not be sufficient to more than offset its drawbacks?

New Britain, Conn. J. H. H.

You are evidently proceeding on the assumption that where a little bit does a great deal of good a large dose will be bound to effect an immediate and absolute cure. As in medicine and many other things, following this plan works out by abruptly terminating all further necessity for experiment. Within certain closely defined limits an increase in the length of the stroke, thus making it exceed the diameter of the bore slightly, is a great advantage, but carrying it further results conversely. It must be borne in mind that the weight of the motor increases at an extremely rapid rate, with every addition to the length of the stroke, and furthermore, that the point beyond which it is no longer advantageous to expand the charge is very quickly reached. The hot gases of the burning charge present on the power stroke of the internal combustion motor cannot be compared with steam, as they undergo an extremely rapid drop in pressure and temperature, so that so far as any real gain is concerned the last part of an extra long stroke is practically wasted. As already mentioned, the factor of weight is by far the most important. It would mean something like 150 to 250 pounds additional to put 2 or 2 1-2 inches on the stroke of the average cylinder of a two-cylinder horizontal opposed engine of 5 inches bore, and the actual gain would be very slight, if, indeed, the extra load does not offset it entirely.

MORE ABOUT FRICTION TYPES OF DRIVE.

Editor THE AUTOMOBILE:

[1,469.]—Noting the inquiry of a correspondent in regard to the merits of friction-driven cars on steep hills, etc., I beg to ask your opinion as to the comparative merits of friction drive and other forms of transmission. Which form would deliver the largest percentage of power at the drive wheels? I believe this column in this papsr is of great value to your subscribers.

Mankato, Minn. X MINNESOTA.

Concerning the relative merits of the friction as compared with other types of power transmission on the automobile, we would refer to letters which have recently appeared in these columns under a similar heading. Where its relative efficiency is concerned, it is well known that for certain power purposes where the load is constant and uniform that the friction drive shows a high efficiency and is very practical. Unfortunately, however, such conditions do not obtain on the automobile. It has been shown by an authority on the subject that where the slip exceeds 4 per cent. the drive falls off considerably in efficiency and as the conditions of service in automobile work are about the worst imaginable, it would appear to be difficult to prevent this. The load is never constant for any length of time and it is about as far from being uniform as it possibly can be. Still the friction drive has proven considerable of a success on a number of light cars, and the experience of the manufacturers of the latter would seem to show that even under such very adverse circumstances as the necessity for pulling a car out of a hole, or starting from dead on a very steep hill, the friction drive has been able to acquit itself with credit.

GETTING MORE POWER FROM AN OLD AUTOCAR.

Editor THE AUTOMOBILE:

[1,470.]—For the benefit of your readers I would like to give my experience for four years with a two-cylinder Autocar.

The first year I was disappointed in the power, but not in the reliability of the car. The second year I had trouble which took nearly the whole season to locate, and here lies the point of my tale. The car could go sometimes and not others, one cylinder was much weaker than the other and likely to stop at any time. I tried everything but finally traced the trouble down to the inlet valves, which are of the suction type, not positively operated, and found that weaker valve springs helped some and this led to the discovery that the shoulders on the valve steme had worn away, allowing the valves to open so far that the suction could not maintain the opening and the valves fluttered during suction stroke. A pair of washers on the valve stems limiting the opening to less than a quarter of an inch completely cured the troubles.

Third year I had my company make cylinders half inch larger in the bore, which increased the power nearly 25 per cent. Fourth year put plates five-sixteenths of an inch thick on the inside of the cylinder heads, raising the compression to a point just short of premature ignition, giving a full 10 per cent. increase in power.

Fifth year ran six dry cells in series instead of four, which gave increase in power. The car seems now to have plenty of power and takes all ordinary hills with four passengers quite easily. I am sure it will pay anyone still using a 1904 Autocar to see to the suction valves and to raise the compression, even if it is not considered advisable to go to the expense of enlarging the cylinders. I wish to take this opportunity to say that the car has stood four years of banging over all sorts of roads and is to-day good for another four.

Amherst, N. S., Canada. A. G. ROBB, Manager Atlantic Auto Co., Ltd.

A GOOD ONE FOR THE IDEAL CAR SEEKER.

Editor THE AUTOMOBILE:

[1,471.]—Referring to letter 1,446, we build a limited number of six-cylinder care of the following specifications: Cylinders, 3 7-8 by 3 1-2 inches; wheelbase, 110 inches; shaft drive to Cameron patented combination rear axle, and selective type gear-set; rear axle, floating type; rear springs, full elliptic, 1 1-2 inches wide, 34 inches long, with rebound clip on each leaf; front springs, three-quarter elliptic, 1 1-2 inches wide; upper half, 17 inches long, lower half, 34 inches long; all springs five-leaf in each section; wheels, light artillery type with quick detachable 32 by 3 1-2-inch tires; body, four passenger, side entrance, of light construction; annular bearings throughout, with exception of the motor; weight complete, 1,700 pounds; ignition, high-tension magneto and batteries; speed with full load, 60 miles an hour, or geared to a top speed of fifty (50) miles per hour when specified. The motor is, of course, our air-cooled type.

If your correspondent (C. W. L., Norwich, N. Y.) thinks this car might be near enough his ideal to desire further information, we should be very glad to supply it.

Beverly, Mass. CAMERON CAR CO., H. W. ROHERTY, Sales Mgr.

ANSWERING THE IDEAL CAR PURCHASER.

Editor THE AUTOMOBILE:

[1,472.]—We note in your "Letters Interesting and Instructive" query No. 1,446, in the July 2 issue. Would state that we are making automobiles very near specifications as follows:

Engine, four-cylinder, 5 1-16 by 6; weight, 300 pounds; engine placed crosswise in middle; shaft drive to floating type rear axle; platform springs in front; scroll elliptic in rear; wheels, artillery type; tires, 36 by 3 1-2, quick detachable; weight, 1,900 pounds.

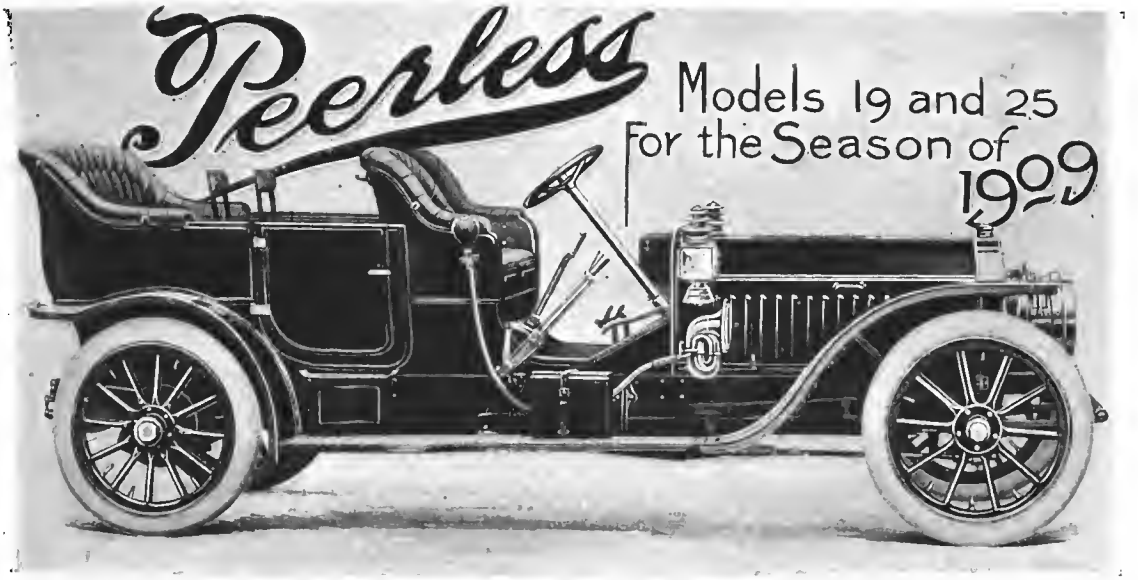
Council Bluffe, Ia. L. P. MADSEN.

ANOTHER OFFER FOR THE IDEAL CAR BUYER.

Editor THE AUTOMOBILE:

[1,473.]—In the issue of "The Automobile" of July 2 we noticed a letter from Norwich, N. Y., signed by C. W. L. The letter in question bears the caption, "Buyer Looke for His Ideal Car." In this connection, we beg to call attention to our new six-cylinder Model L car, which sells for $3,000. Upon examination of the specifications, I think C. W. L. will find that this is the car he wants.

Buffalo, N. Y. E. R. THOMAS MOTOR COMPANY, F. L. Faurote, Adv. Mgr.



The Six-cylinder Peerless Presents Artistic and Attractive Lines in Design.

TWO models will be manufactured by the Peerless Motor Car Company of Cleveland, Ohio, for the season of 1909, say the makers, and the appended description of the newcomers is practically a verbatim reproduction of their advance sheet—material that is but infrequently available in its original form, owing to the publicity man indulging in too free flights of fancy in describing the car's advantages. "These models are styled Model 19 and Model 25. The former model is rated at thirty horsepower and is a four-cylinder car, while the latter model is rated fifty horsepower with six cylinders. These two models will be ready for delivery early in September.

"The changes for 1909 Peerless cars are in no way radical, but are such as to secure a refinement and improvement in some respects of the already satisfactory 1906, 1907 and 1908 models. The principal changes are: An increased wheelbase, which provides for a greater distance between the dash and front seats, for a slightly lengthened engine hood, and allows for setting the radiator further back on the frame than on the 1908 models; improved front and rear fender design, with increased clearance for wheels; new adjustable universal shaft connections between clutch and transmission; improved universal propeller shaft driving joints, as well as a new and improved universal coupling between live axle and differential; a new style silent running water pump; a method of lubrication.

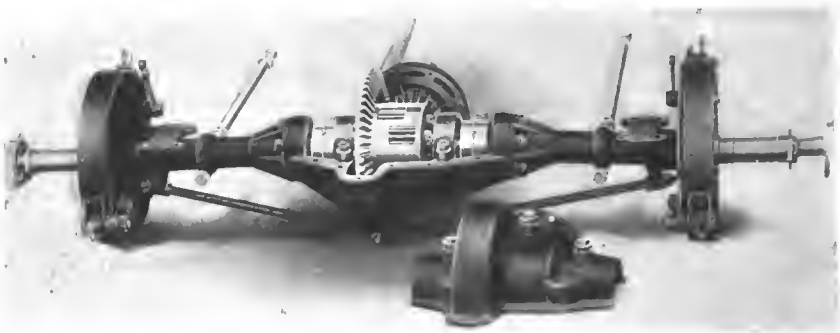
"Especial attention has been directed to the design and construction of each one of the universal driving joints throughout the car, and important improvements have been achieved, both in respect to strength and wearing qualities. The cylinder dimensions for the new Models 19 and 25 are 4 7-8-inch bore and 5 1-2-inch stroke. The cylinders are cast in pairs, with offset intake and exhaust valves on opposite sides, and are carefully bored, reamed, ground, and then lapped out with a special polishing preparation with pistons and rings in place, all of which secures perfect compression and insures a motor that will run very smoothly.

Simple Form of the Peerless Clutch.

"The water jackets are spacious, allowing the greatest freedom for water circulation throughout the motor. These jackets taper so that the greatest amount of water is at the top, which is the point of highest temperature. The large openings over the water jackets provide for a careful and certain removal of core sand, and are covered with brass plates. The crank case proper is a single aluminum casting, designed for lightness and strength. Access to connecting rods and bearings is through aluminum hand hole plates on the bottom of the crank case. Each of these hand hole plates is fitted with a patented device, which consists of a deep pocket or groove at its lowest point, into which drops any dirt or sediment from the oil.

"The crankshaft is a solid one-piece drop forging, heat-treated and ground accurately to size. The front bearing is an annular type ball-bearing, fitted with a stuffing box to prevent leakage of oil. The rear bearings are of large size, provided with oil grooves and pockets so that they are constantly flushed with oil by splash from the crank pits.

"Every gear of the motor is housed in an oil-tight compartment of the crankcase and runs in oil. By housing all gears an almost noiseless motor is secured and the wear of the working parts reduced to a minimum. The intake and exhaust valves are made of an imported special alloy valve steel, and are taper-seated, mechanically operated and interchangeable. The carbureter is automatic in its action and provides a suitable mixture for varying motor speeds. A patented double seated throttle is used, admitting the mixtures to intake pipes through both seats, so that there is no suction force to overcome, and consequently the throttle is controlled smoothly and evenly under the varying conditions of load and grade. The throttle is controlled by a hand lever on the steering wheel, by foot accelerator pedal and by a governor located on the water pump shaft, the latter being automatic.



Assembly of the Peerless Rear Axle Driving Unit.

"A mechanical oiler, gear driven, is located on the exhaust side of the motor, and supplies oil to each cylinder and to the compartments of the crankcase. The oil reservoir is cast integral with the aluminum crankcase and holds over one gallon of oil. The oil is pumped from the reservoir to adjustable sight feeds located on the dash in constant view of the driver. The crankcase compartments are supplied with oil from the oil pump through sight feeds as described, and in addition thereto may be replenished by means of a hand pump, which is made a part of the oil reservoir. This pump is fitted with an indicator so that the oil may be directed into any one of the compartments at will. The level of the oil in the crankcase compartments is regulated by means of standpipes extending upward through the bottom cover. These standpipes are fitted with petcocks underneath the car, which, when opened, determine the proper oil level in the compartments.

"The radiator is the well-known Peerless design (patented) of the same construction as used in 1908, and of ample size to properly cool the motor under the most trying conditions of service. The circulation of water is affected by a herringbone gear pump, which is silent in its operation and highly efficient. The fan is driven by bevel gears with a friction disc joining the driving shaft with hub of fan spider. By this construction no belts or pulleys are used and the fan shaft is operated by gears directly driven from the half time gears on the motor.

"The ignition system consists of the Eisemann low-tension magneto, the current of which passes through an induction coil on the dash, giving a high-tension current at the spark plugs. In addition to the magneto system, and entirely separate, there is the same coil, commutator and battery system which has always been used on Peerless cars. The advantage of this double system of ignition is that either may be used independently; that is to say, the commutator, spark coil and battery may be entirely removed from the car, and there still remains a perfect magneto system of ignition; or, on the other hand, the magneto may be taken off and there is still the same well-known and thoroughly tested battery system which we have used for many years. All wires are connected with their terminals by spring attachment, so that there are no thumb nuts to release, and the wires may be instantly detached and the magneto entirely removed in less than one minute. By means of a solid rubber wire bar the method of wiring has been changed with respect to shortening the length of wires, which makes the whole ignition system simple, compact and of highly perfected appearance, and almost impossible to short circuit or to mistake the right connections at the spark plugs.

"The clutch is the internal expanding band type. It engages smoothly without shock, and being light and perfectly balanced, it stops rotating as soon as disengaged, so that the gears may be shifted noiselessly. Between the clutch and transmission is a shaft made of special alloy steel, the ends of which are forked and fitted into universal joints. These joints connect with the squared ends of the clutch and transmission shafts. The object of the universal joints is to take care of the twisting of the frame over very rough roads, and consequent loss of power as well as excessive wear. This forked end construction is capable of very easy adjustment, and the parts are easily removable.

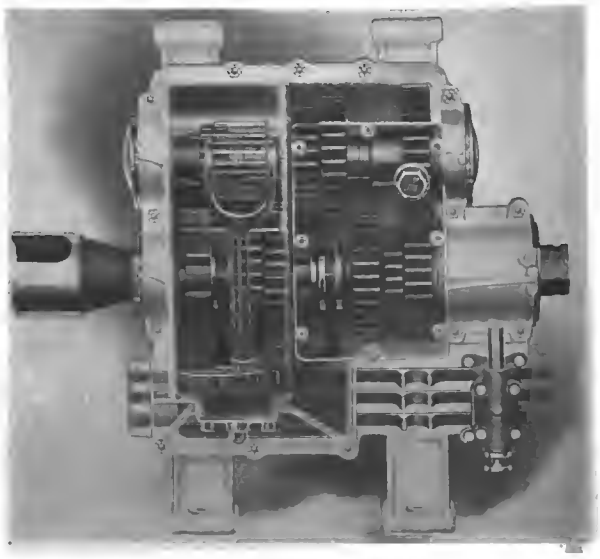
"The gear case is an aluminum casting made in two parts, the base containing the main shaft, driving gears and the countershaft with its pinions. The upper part of the speed case holds the mechanism for engaging the reverse gear. The gears and pinions are meshed by sliding gears of the selective type. The mechanism for meshing the reverse consists of a rack, rocker arm and sector with a cam. The feature of the change speed mechanism is the locking device which prevents the gears from sliding out of place, without changing the position of the change speed lever operated from the driver's side.

"The propeller shaft is fitted with universal joints at both ends, thus taking care of any relative movement.

"The type of universal joint on the propeller shaft of the 1909 cars has not been changed, but the joint has been improved in detail by adding ball bearings, and enlarging the joint for greater strength and wearing qualities.

"The universal joint pin of the new models now has a groove accurately ground and filled with balls, upon which an annular ball race turns. This ball race takes the place of the rollers on the older models, and its ease of turning and the assurance of being well oiled greatly improve the efficiency of the joint. The materials of the joints are of specially treated alloy steel, ground accurately to size. The joint is provided with a steel cover to house the rollers and hold sufficient grease to properly lubricate the joint.

"All the weight and load of the car is carried on heavy gauge steel axle tubes fitted into a cast-steel differential case, centrally located between the rear wheels. The power is transmitted by means of bevel gears, differential and live axle shafts operating clutch plates engaging with the wheel hub. On each side of the driving gears, and connecting with the live axle, are improved universal joint connections. This cardan or universal joint in the rear axle allows for the camber and dishing of the rear wheels, and is of a different type than those of previous years. By virtue of the greatly increased number of engaging points (14) over the previous year's construction (2), the uni-



Plan View of the Change Speed Gear Set.

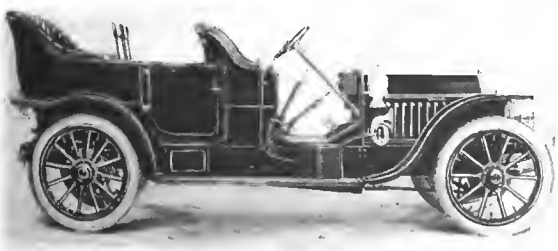
versal action is more uniform, the wearing qualities greatly improved, and from the fact that the driving or engaging faces are at a much greater distance from the center of the shaft than on the older types the construction is greatly increased in strength. They are made of imported alloy steel specially heat-treated to withstand rigorous usage.

"The front axle is a solid one-piece drop forging of I-beam section with spring saddles forged integral with the axle. The center of the front axle is the lowest point of the car. The pivot joint of the steering knuckle is supported on specially imported self-seating ball-bearings of large size. The steering mechanism is of the worm and gear type. The gear is a complete wheel, and being forged with the shaft assures the greatest possible strength, besides providing a greater wearing surface. Thrust bearings of special imported design are placed above and below the worm, and are spherical, self-seating. An 18-inch hand steering wheel is used on both new models. The steel rod connecting the steering knuckles is placed behind the front axle, where it is securely protected from any road obstruction or injury.

Details of Peerless Steering Mechanism.

"The frame is cold-rolled steel, of truss pattern, with sub-frame on which engine and transmission are carried. The drop frame adopted in 1906 is a feature of great importance, since the center of gravity of the car and load is nearer the ground, and yet does not interfere with the road clearance. The drop frame insures more comfort in riding, and the car may be handled more easily and safely at high speeds.

"Springs are made by Lemoine, of France, of the best grade silico-manganese steel procurable. Both front and rear springs are long and flat, and are highly polished lengthwise, which gives easy action, and in combination with the drop frame insures an easy riding car, adapted to rough country roads. Thirty-six-inch wheels, artillery type with dished spokes, are used both front and rear. The dished spoke construction best withstands any side strains, besides enabling the spokes and wheels to be made much lighter with more safety than wheels not dished. The body is the Peerless type, the rear seat being wide and the tonneau long and spacious. There is ample room for carrying five people comfortably in the tonneau. Seats have been designed of the folding type, which are practical and comfortable, and are very easily removed. A new patented door latch provides a simple and easy method of opening the door from the tonneau seat. The closed and touring bodies are interchangeable.



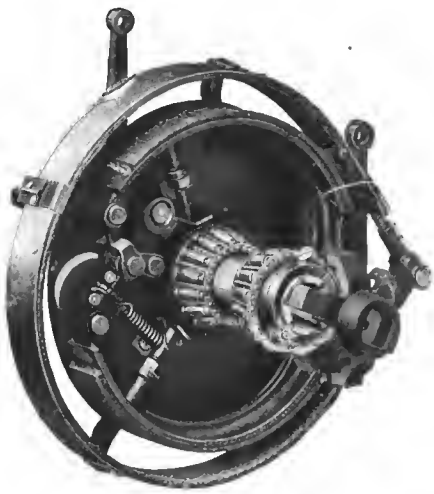
Four-cylinder, 30-horsepower Peerless Touring Car.

SOME NEW TIMKEN PRODUCTS FOR 1908.

Among the new products listed by the Timken Roller Bearing Axle Company, Canton, O., for the present season are a 1 5-8-inch I-beam forward axle, and their 6 B rear axle. The front axle is designed for cars weighing up to 3,400 pounds, ready for passengers, and embodies the latest developments in axle construction for pleasure cars. The center is a forging in one piece

Timken One-piece Drop-forged Front Axle Complete.

from open-hearth steel of a special grade, the spring saddles being forged integral, while the top flange of the axle is widened to give additional stiffness fore and aft. Timken roller-bearings, located in the top of the steering knuckle carry the load and render steering very easy, this being an important feature on high-powered cars where a heavy engine load is carried forward. The steering arms are put into knuckles with a taper shank of generous size, insuring safety at this critical point. Bosses are provided for making a good mechanical job of the attachment of the speedometer bracket. Only rear steering is provided, as with the latter the wheel centers can be brought much nearer the pivot center.



Rear Wheel Double Brake Assembly.

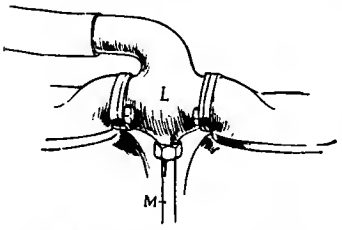
The Timken 6 B rear axle is designed for cars under 40-horsepower and weighing up to 2,800 pounds, ready for passengers, or when equipped with nickel-steel tubing and shafts, it is suitable for 60-horsepower cars up to 3,400 pounds, thus making it

Timken Rear Axle Driving Unit Complete with Brakes.

the companion of the front axle already described. It is made with either single or double brakes on drums integral with the inner flange, separate drums with an air space between, being employed with double brakes. The internal brake is completely housed and easy adjustment is provided on both. The axle tubing is 2 1-2 inches diameter by 1-4 inch wall, and is keyed and riveted into both the brake bracket and the center housing. This is a one-piece casting, carrying all of the bearings for the pinion shaft and differential, entirely independent of the driving shaft. Gear ratios of 2 1-2, 3, and 3 1-2 to 1 are optional, according to the weight and power of the car to which they are to be fitted. In the case of both the front and rear axle, the unit is entirely complete and ready to be placed upon the chassis for which it has been designed, bolting to the springs and connecting being all that is needed.

DOINGS OF BUSY INDIANAPOLIS FACTORIES

FOR many years prominent in flour-milling machine construction, possessed of a magnificent and beautifully situated plant and an inexhaustible fund of industry, the Nordyke & Marmon Company is exceptionally interesting to the student of modern motor car practice. The Marmon product stands in tbe same light to American practice that the Lanchester has occupied in European; that is to say, a car of exceptionally sound construction yet full of original ideas. There have been some radical changes in the Marmon for 1908, changes which experience showed to be justifiable under the march of conditions, but all of the principles which characterized the design of the first Marmon car still remain, although elevated to a higher plane of development. The new Marmon engine is an especially fine piece of work, and incorporates many features which the close observer would doubtless trace to a searching acquaintanceship with the highest grade of foreign practice. There are some excellent original ideas, however, incorporated in its construction, but these are mostly found in the details and not in any of the functional essentials.

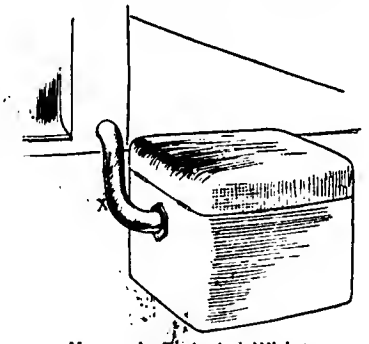


Water Coupling on the Marmon.

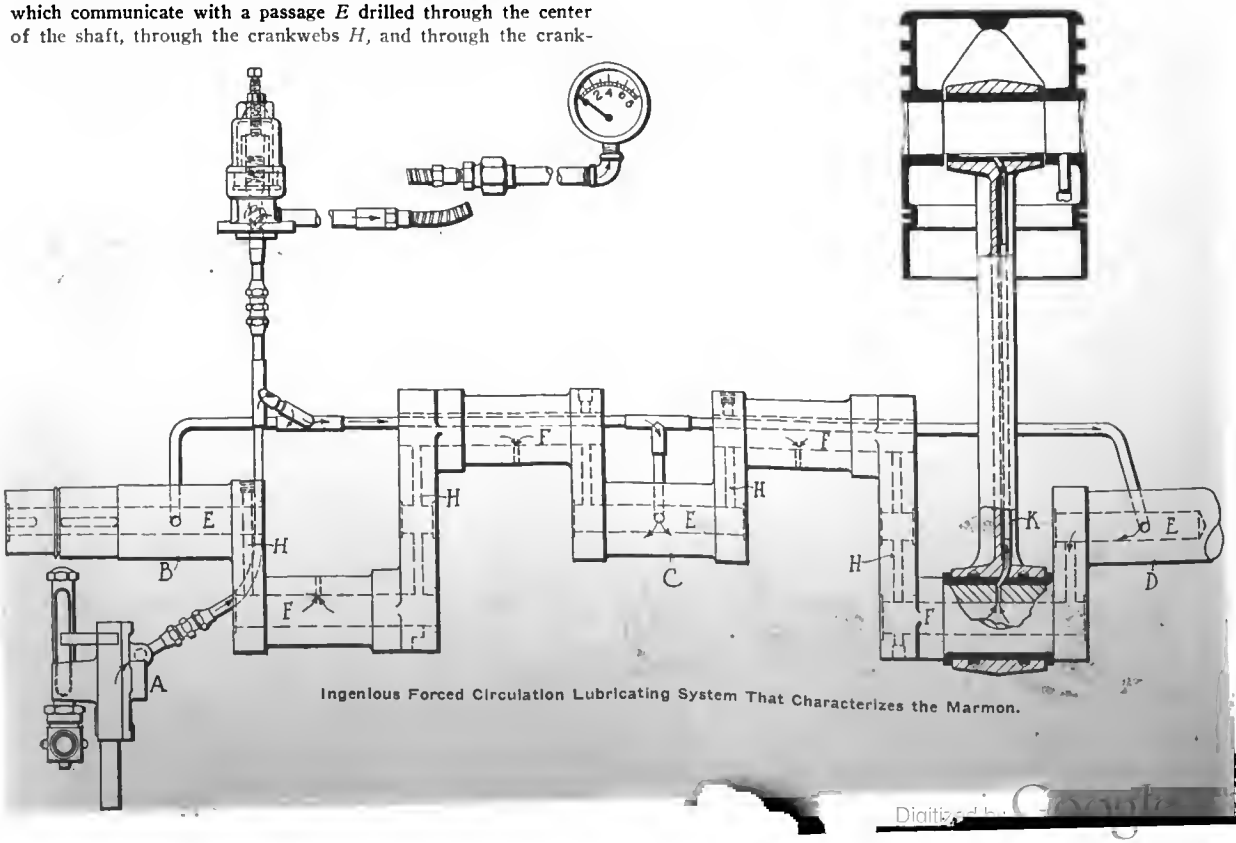
A Self-contained Oiling System.

Probably the most interesting feature from a purely mechanical point of view is the system of forced lubrication, and although this is not uncommon abroad, it is used by few in this country. As shown in the diagram, it consists of a gear pump *A* taking oil from the base of the crankchamber forming a reservoir, forcing it thence to the crankshaft bearings *B*, *C* and *D*, which are grooved to receive the flow. Drilled so the grooves may supply oil to them are holes in the crankshaft journals which communicate with a passage *E* drilled through the center of the shaft, through the crankwebs *H*, and through the crankpins. Thus there is a complete oil passage through the crankshaft. The crankpins *H* are drilled to permit the egress of oil and the connecting rod bearings also are suitably grooved to distribute it. From these, however, an aluminum pipe *K* is run to the piston pin bearings, whence it can escape only by passage along the piston pin, thus insuring complete lubrication of tbis usually indifferently lubricated portion of the engine's anatomy. It is found that with the pump giving a pressure of approximately two pounds an ample flow of oil is kept to all parts, which flow of oil is proportional directly to the speed of the engine, and independent of the amount of oil in the system, provided, of course, there is sufficient to provide for the pump immersion. Another rather pretty construction is the way in which the upper water connection of the cooling system is made.

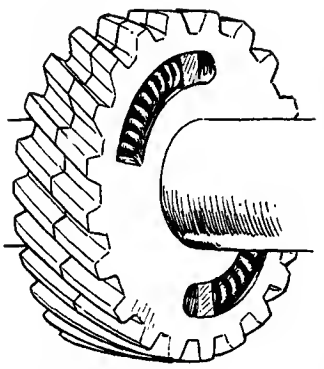
The Nordyke & Marmon company utilizes a double three-point suspension for the unit upon which is mounted the engine and transmission and for the running gear. The employment of this floating system makes it imperative that flexibility between the engine and the radiator shall be insured, so that a long rubber hose is utilized in place of the usual short section. The waterjacket covers carry opposed flanges between which a T-fitting *L* is located. This T-fitting also carries the union for the connection *M* to the carbureter waterjacket. Another interesting feature of this engine is the way in which the valve tappet lifters carrying the rollers which bear on the cams are located. The rocking lever is bracketed to



Marmon's Protected Wiring.



Ingenious Forced Circulation Lubricating System That Characterizes the Marmon.



Overland Spring Crankshaft Gear.

a circular flange, or cover, which registers in the crankcase. This and its adjacent fellow are held in place by a yoke and a central bolt which secures the two but renders them easily detachable. A feature of the Marmon valve system is the absence of a screw adjustment. The upper end of the valve tappet is drilled to receive a hard steel T-shaped tip, and any adjustment is made by adding or taking away shims below this tip. It may seem at first sight that this system is a little crude, but it certainly makes for simplicity, and one thing is sure, that after an adjustment has been made it certainly will remain fixed.

Novel Air Pump for the Fuel Pressure.

Another very interesting thing, and one which is novel in this country, is the use of a small air pump, cam-driven from the camshaft on the exhaust side of the engine, for maintaining the pressure on the gasoline. This pump has a bore of about 1 inch and a stroke derived from an eccentric cam of about 3-8-inch, with a spring return. The suction valve is mounted on the head of the piston, and the delivery valve, which consists of a small ball, held down to its seats by a spring located in the cylinder cover, which also carries a relief valve. The relief valve, of the ball check pattern, is larger than the pump check valve in order that the cylinder head containing both may be made a one-piece job. In order to secure this end the pump check valve is first dropped in and then its retaining spring got into place by means of coiling it more tightly in order to secure the reduction of diameter necessary to pass into place. Above this then comes the relief valve, which also has a superimposed coil spring adjustable to determine the maximum pressure on the gasoline. Another check valve is floated on the line between the pump and the gasoline tank, but this is done merely for the sake of precaution and to insure a perfectly tight connection at all times. The interesting point about this pump is the lack of noise, for any small air pump is apt to make considerably more sound than warranted.

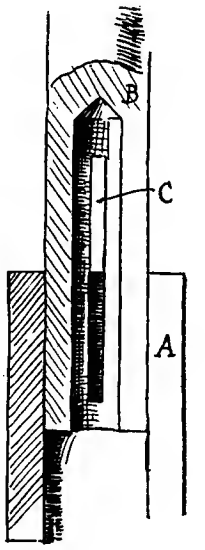
Marmon Double Three-point Suspension.

One of the principal constructional features of the Marmon car is its double three-point suspension. The engine and transmission are mounted upon a subframe pivoted to the main frame triangularly, the base of the triangle being forward and at the apex in the axis of the drive. This entails the inclination of the subframe carrying the engine and transmission rearwards in order to secure that desirable feature, a straight line drive, in conjunction with the equally desirable quality of ample clearance. The system of forced lubrication used entirely obviates trouble from this inclination.

A novel feature is the arrangement of the clutch and striking mechanism. In the first place a multiple-disc clutch with cork inserts is used. In the second place comprehension of the failings of the disc clutch has led to the adoption of an ingenious automatic clutch brake; and, thirdly, the clutch-striking mechanism is all safely ensconced in an extension of the gearbox away from the dust and dirt and always lubricated.

While talking of the National company's product mention was made of the fact that it has found the insertion of radial ball bearings in hard aluminum alloy cases without the use of intermediate cages perfectly satisfactory. In the Marmon machine a wide divergence from this practice is noticeable, for wherever a radial ball bearing is used a cast steel cage is employed to retain it. In the gear-set quite an original system is employed, the shafts with their bearings being supported in cast steel spiders which register in the gearcase, being securely bolted into place. The means of retention of these bearings is most ingenious. The cage is tapped for a 1-4-inch set screw, under the head of which a washer is located. This washer bears segmentally upon the outer race of the bearing, thus retaining it in place against end pressure. A number of these retainers are used about the periphery of the bearing race and the whole is securely locked by a wire threaded through holes in the heads of the set screws.

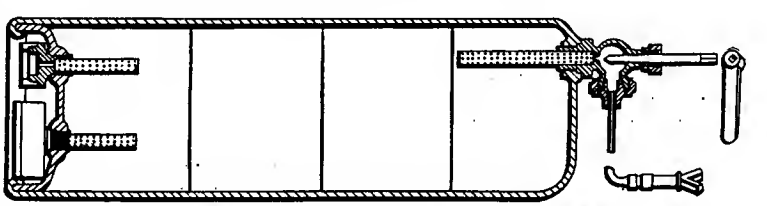
As with any car having this distinctive ingenuity of design, it is difficult to select just the points which are most interesting, exactly in the same way that it is difficult to describe with lucid reading interest a machine that differs in nothing from an accepted past standard. One cannot help, though, being impressed at the Marmon factory with the enormous amount of detail work through which the producers must have fought their way to their present status. There is no crudity found anywhere—the Marmon method is used all through, but perfection of purpose has certainly been reached. Look, for instance, at the way in which the battery leads are taken care of. The sketch shows the copper tube *X* encasing them, carrying them up to safety from weather conditions within the haven of the dash.



Speed Carbureter Jet.

Overland Cars Being Made in Tents.

To leave the Premier and Marmon factories and in a little while come to the Overland factory is to leave a staid eastern city and drop down in a real live western town. They are surely "going some" at the Overland plant. They are literally building machines in large tents grouped about the factory precincts and every available inch of ground space is crammed with men who are bing persuaded to do their utmost to bear their part in the production of the Overland success—for it has been a success, this little machine. Everybody at the Overland plant has the most irregular habits as regards eating and sleeping and quite regular ones as to work all the rest of the time; but through it all they carry a look of satisfaction that is unmistakable. On the dusty, bumpy road that runs past the factory doors test cars tear up and down just as hard as the men driving can send them. From a tent in the rear comes a continuous high-frequency rattle that tells of many engines on the test stands. In the factory proper no one has time to talk, for each and every one of them is a slave to success. The great rivalry of the plant is for the assemblers to beat the body builders, and it's a dead-heat race most of the time, for every available ounce of nerve pressure is being utilized by the entire working force to achieve that end.



Sectional View of a Prest-O-Lite Acetylene Gas Tank.

Overland Cars Being Built and Assembled Under Canvas.

It's a neat little machine, too—it looks well, behaves well, has snap, power, speed and is exceptionally quiet. The writer has rarely ridden in a quieter low-powered car, and this feature of the Overland is the more remarkable since the change speed gear is of the planetary order located at the rear axle. There are some things in the construction which are hardly conventional, but some are exceptionally effective. One is the arrangement of the forward engine gears. These are of the single helical type, and as such, except that it is rare practice to find them on a low-priced car, not remarkable. There is, however, a point of novelty that is distinctly worth while. The gear on the crankshaft has an extension to it which is free to turn on the shaft. By means of small springs tendency to relative motion is maintained between the gear proper and the extension, with the result that backlash in the gears working with the divided engine gear is entirely eliminated, irrespective of the amount of wear involved.

Presto-O-Lite Factory a Hustling Plant.

It is curious how the creation of an industry brings others in its wake. Few people have any idea of the magnitude of the American automobile industry *per se*, and still fewer of the extraordinary versatility of allied trades. For example, every autoist is conversant with the Prest-O-Lite tank and is thankful for the boon its invention conferred upon motors and mankind, but not a tithe of the interested public has any idea of the magnitude of the organization necessary to handle the manufacture and recharging of such an itinerant accessory. Prest-O-Lite tanks are, of course, charged at various central local stations all over the country, but the bulk of the manufacturing is done at the Indianapolis plant, although the drawn shells are from farther west.

The shell is filled with a porous absorbent body, partially saturated with pure acetone, a chemical closely allied to ether, which has the property of absorbing acetylene gas to an extraordinary degree, which absorption properties are increased by the gas being introduced to the acetone at high pressure. During the process of absorption the acetone almost doubles its volume and its weight increases.

The practical adaptation of these principles constitutes the Prest-O-Lite manufacturing process. The seamless steel shells are filled with an absorbent asbestos compound and the ends are brazed in. A known quantity of pure acetone is then introduced into the shell through the medium of the valve by means of a vacuum system. The tanks are then coupled to a pressure line carrying pure dry acetylene gas made from calcium carbide and water in huge generators and thoroughly scrubbed and dried. They are left on until heating of the tank from the internal absorption warns the operator that the first stage of filling is complete. The tanks are then permitted to cool, after which gas is again turned on, when, as a rule, the filling process completes itself without further attention.

To go closely into the process involved from a manufacturing standpoint would be exceedingly technical and, although interesting, somewhat out of place. To the lay mind by far the most engrossing of the mysteries of the Prest-O-Lite tank is the way in which its travels are tabulated. In the center of an annular table sits a young woman, and about her, placed radially, are card trays carrying ordinary card file size cards. These cards are serially and consecutively numbered and each card represents a tank—different sizes of tanks are accounted for by different colored cards. One side of each card is devoted to shipping instructions, with dates of shipment; the other to origin of consignment and dates, so that by taking a card out and glancing at either side consecutively one can tell exactly the tale of the journeying of that tank with reference to the home office. It's a marvel the way those tanks get around, almost like a fairy tale. A tank will start out from Indianapolis for New York and finish up in San Francisco months and months afterwards. The Prest-O-Lite company has its troubles, too. People manage to get the tanks full of water once in a while, although how it is done is a mystery to the firm. Then, notwithstanding instructions, they will insist on putting tanks on upside down, etc.

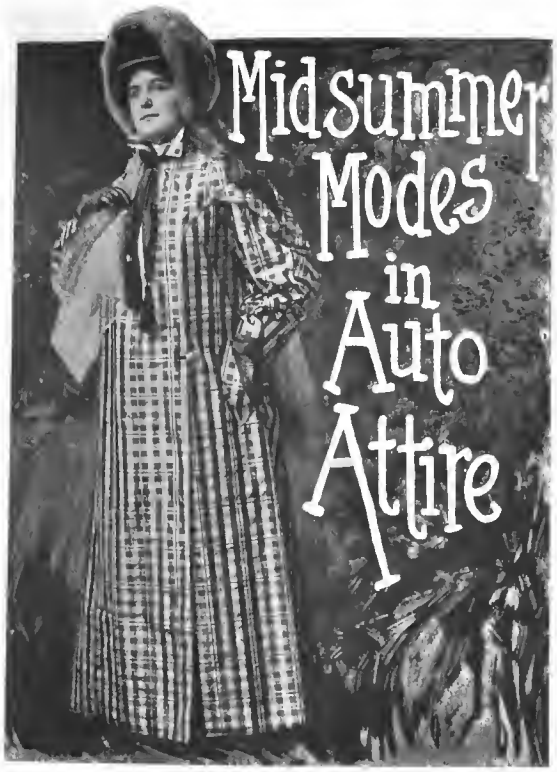
Air-cooled Motors, Carbureters and High-wheelers.

A concern that has been steadily working along in the automobile accessory business for a long time now is the Speed Changing Pulley Company. Apart from the manufacture of double-opposed and four-cylinder air and water-cooled engines upon entirely standard lines, it also is established in the carbureter branch of the industry. The carbureter this firm makes is now known as the Speed, but up to recently was termed the Universal; it has been on the market some time. To the mind of the writer, the jet device whereby the gasoline flow is regulated is one of the cleverest extant. It consists of a hollow stem having two very narrow saw cuts made in it. These cuts are meshed more or less as the gasoline supply is to be increased or cut down, as the case may be. This is particularly effective as an adjustment, as with it a change in the gasoline feed is quite gradual in its bearing upon the behavior of the carbureter. This firm, too, is experimenting at present with a high wheel buggy-type machine,

KEEP THE STEERING WHEELS PARALLEL.

Sometimes the front tire will wear abnormally, and the blame may be put upon the tire manufacturer, while it is really due to the wheels running out of parallel, and consequently there is rubbing on the ground as well as rolling, says *The Autocar*. With a car of good manufacture this may be thought an impossibility, but this is not the case if the car has been badly handled in daily use. One frequently sees a garage attendant move a car from one place to another, wrenching the front wheels round by means of the steering wheel with the car stationary. As the steeing gear enables one to put a great deal of power into turning the front wheels, the stress on the steering arms is very great, and consequently they are liable to be bent, and, in fact, do become bent out of shape, with much handling in this manner. Attention has also been called to the ill-effects from straining the gear with the hand wheel when stationary.

Midsummer Modes in Auto Attire



Novel-shapsd Coat of Clan Plaid Taffeta.

THE woman who fancies that almost any long coat, small hat and enveloping veil will answer for an automobile excursion makes a grievous mistake. Makeshift garb for such a purpose is quite liable to cause her to appear preposterously out of date. Moreover, out of regard for her hosts she should endeavor to be as smartly clad as is possible.

Midsummer automobiling is now so attractive a character that many women of unlimited bank account do not resist the temptation to purchase a number of outfits of distinctly different types. Some of these costumes are of a somber tone, others are almost frivolous looking, but all of them are decidedly smart.

In selecting an outfit for a tour of sevcral weeks' duration, such as many family parties take at this season of the year, it should be remembered that luggage space must be economized to the utmost. Consequently it is best to limit the number of long coats to one. This should be a rubberized rainproof garment of invisibly striped or plaided mohair, of some color that will not readily show the dust. For this purpose a medium shade of gray is excellent or the khaki brown that is now so fashionable and accords so well with a natural hued pongee traveling frock. These come in ulster shapes that are smooth-fitting across the shoulders, where the fulness is taken up with tailored darts. There is no unnecessary bulk about the hips, but the lower portion of the skirt slopes sufficiently to afford comfort when the wearer is seated and to prevent the garment from wrinkling at the knees. These coats have double-breasted fronts, fastening with moderately sized buttons, covered with satin matching the turn-back cuffs and turn-over collar. With such a coat may be worn a mohair-crowned and kid-visored cap, covered with a chiffon veil of a matching tint unless the fair automobilist possesses the moral courage to don a red veil, which better than one of any other color will protect her complexion from the sun.

For a short trip, during which there is a slight chance of being exposed to rough weather, there are coats of pearl gray, champagne or pure white crêpe de chine and twilled silk, which are exceedingly attractive. They are developed somewhat on *directoire* lines, in that they outline the figure without actually defining it and are short-waisted at the back. In front they close to below the knees with a single row of large fabric-covered buttons, so that when the wearer is seated in the car her frock is quite as adequately protected as if worn beneath a utility ulster. Of the same class are the stunning garments which are also used for carriage and country evening coats. These are of champagne-colored rough pongee, long, semi-fitting, double-breasted, closing with two rows of chased silver buttons resembling tiny inverted bowls. Their wide, turn-over collars and cuffs are broadly banded or piped with black satin and faced with corded silk of the genuine Hungarian cerise, which most nearly resembles that of the uncooked beet. The entire coat is lined with the same deep, vivid shade and there is a touch of it on the long black satin scarf which draws the collar together beneath the chin. With a garment of this character the hat must needs be of a distinctive character, like the pongee and Panama combinations or the natty little turbans of colored fine straw with crowns, bands or scarfs brightly striped, that are now so deservedly popular.

Another type of autoing coat which is popular for short midsummer trips is of checked and striped linen, which is neither dust or rainproof, but exceedingly light and cool, and possesses the merit of laundering in a satisfactory manner. These wraps are often the third piece of a linen costume comprising a jumper suit, a princess or a skirt and blouse of tobacco brown, dark blue or tan linen trimmed with contrasting shade or color. To accompany them are linen caps of the same hue, but rather more becoming headgear for both young and middle-aged women are the linen turban and toque shapes carrying short wings and quills.

There are certain accessories which every woman should take when starting on a trip of more than a day's duration. One of these is the rubberized and flannel-lined tweed or serge shoulder cape that is deep enough to reach to her hips and has a collar wide enough to protect her neck. Some of these capes have hoods which may be drawn over a moderately sized hat in case of a sudden rainstorm, but these are hardly so comfortable or so readily adjusted as are the separate hoods of silk-lined rubber, generously punctured with ventilation eyelets. Another accessory which should never be omitted is the hip-length sweater, with its high collar and long sleeves, which comes in several colors and is of the finest zephyr. Such garments have prevented many a thinly clad automobilist from contracting a severe cold. As they cling closely to the figure, even the woman who considers herself just a bit too plump for the prevailing long-lined classic effects need not fear that they will add

All Ready to Take the Wheel.

Auto Masks That Are Becoming.

too perceptibly to her apparent bulk.

Now that the sleeves of all daytime gowns are made so much longer and actually protect the forearms, long-wristed gloves, which formerly kept the draft from whisking up the wide wrist openings of her touring coat, are no longer necessary. The gloves designed for midsummer are of spun silk or lisle, with double finger tips and palms lined with kid. These are the most comfortable affairs imaginable and infinitely prettier on the hands than were those of heavy pelt that were so generally worn last year. Few, save the women who actually take the wheel, use gauntlets, and these are made similarly to those worn by men, save that the cuffs are sometimes stitched. If silk and lisle gloves are not comfortable, the next best choice is wash chamois. These are necessarily very loose fitting and therefore not so smart looking as are those of woven materials.

Women who constantly use the car find that in the long run it is better to wear high-topped shoes, as the ankles are apt to get chilled during a long ride. Moreover, such footgear looks more modest when the wearer must alight from a car within full view of the occupants of a hotel or clubhouse veranda. It is always best to have the shoes match the shade of the coat, and if this garment be of gray or tan the desired hue may be found in ooze calf, which is exceedingly flexible and therefore comfortable.

Although every automobile coat is supposed to have capacious pockets over the hips or at the side seams, a hand bag of moderate proportions is an additional convenience. The pigskin novelties of this description are perfectly equipped with all the smallest toilet conveniences arranged so compactly that in the remaining space may be put a China silk dressing jacket, an extra handkerchief or two, and a pair of stockings and slippers, not forgetting the dainty embroidery or lace-trimmed "nightie" of soft cotton that may be folded into small compass. It is the presence or lack of these numerous small accessories that make for comfort or the reverse when on tour, and only the woman who knows what it is to cover a hundred miles a day over an extremely dusty road can realize what it means to arrive at a hotel in the last extremity of dustiness, only to find that the process of rejunevation must be accomplished with the meager facilities afforded by the public hostelry. Despite the apparently adequate protection that the proper garments afford, the dust and dirt are all-pervading.

Two-toned Fashionable Costume.

Smart Clan Plaid Taffeta Coat.—Every woman who has the slightest claim to Scotch ancestry selects the plaid of her particular clan when buying a taffeta automobile coat of that type. Because the patterns are of themselves effective, the garments are developed on the simplest of lines. Some of them have absolutely plain fronts, which fasten at the left side just below the waist line and again near the shoulder by lapping over the top of the draped sleeve, which gives the sloping shoulder effect to the garment. The vogue of satin trimmings shows in the tassel-ended necktie, and the diamond-shaped epaulets and the cuff insets.

Ready to Take the Wheel.—Women who are expert drivers of automobiles contrive to get themselves up most effectively for their diversion, although it is necessary to wear a coat sufficiently roomy about the shoulders and arms to allow the body perfect freedom. As a veil is liable to blow across the face and impede the view, it is for the nonce discarded in favor of a semi-hood, which protects the hair and ears from dust. This is of the same material as the rubberized white coat and is attached to the under side of the hat brim. The silk covered rough straw hat should be so close fitting that the wind will not disturb it. It is trimmed with dark wings and fancy braid to match the kid gauntlets.

Masks.—To protect the complexion from freckles, sunburn and tan and at the same time to obtain an uninterrupted view of the scenery is a problem only to be solved by the motoring mask. This is built upon a slender wire frame, shaped to fit over the nose and beneath the chin, and is composed of isinglass veiled with a ten-inch ruffle of white point lace. Such masks may be adjusted to hats of any shape and are put on before the veil or hood is arranged. As they leave only the eyes exposed they are quite as becoming as the face veils worn by the women of the Far East.

Two-toned Costumes.—Among the most attractive of the widely checked rubberized taffeta motoring coats are the ulsters in two tones of blue, brown or green, having double-breasted fronts, closing with medium-sized buttons, patch pockets similarly decorated and cuffs and collar of the darkest hue. The two-tone scheme of coloring is carried out in the hat and veil, the straw turban being of the darker shade and trimmed with a soft silk scarf of matching hue, and the veil of the pale tinted chiffon embroidered with dark polka dots and finished with a scalloped edge.

THROUGH BOSTON-NORTH SHORE ROUTE OPEN.

Boston, July 13.—An important concession to automobilists has been made by the Metropolitan Park Commission in the opening to motor vehicles of the Revere Beach driveway on every day during the summer except the afternoons and evenings of Saturdays, Sundays and holidays. This driveway is a short stretch of road connecting the Revere Beach parkway, the main route from Boston to the North Shore and beyond, with the extension of the parkway and the State road leading into Lynn. Heretofore automobilists were permitted to use the driveway in the summer time only after 11 o'clock at night and before 11 o'clock in the morning. With the opening of the driveway at all times except Saturday, Sunday and holiday afternoons and evenings, a complete park route from Boston to the North Shore is available. Previously motor vehicles have had to use a narrow town street crowded with street cars and beach visitors in the rear of the driveway, and it was far from being a pleasant route over which to drive a car at any time of the day.

Aeronauts Enjoy Summer's Sunny Skies

The French War Balloon "Republique" Ready for Flight at Moisson.

PARIS, July 9.—*Republique*, the dirigible automobile balloon of which France is so justly proud, has been launched. At 3 o'clock of a calm June morning there was bustle and activity around the big Lebaudy shed on the plains of Moisson, 30 miles to the northwest of Paris. At 4 A. M. the successor of the unfortunate *Patrie* majestically came forth into the open air and at five o'clock George Juchmes mounted on board and gave the order for the big Panhard engine to be cranked. Three minutes later the *Republique* was heading off to the west on its first trip in its natural element.

It was a mere formal preliminary flight that was attempted, the pilot and his crew of three being satisfied after the airship had evolved in all directions for a period of 34 minutes. For the next six days trips will be made every morning, weather conditions being favorable, the military crew will be trained, and at the end of that time the army commission will be invited to attend the official trial trips, during one of which the automobile balloon will be called upon to travel at full speed for two hours. A brief stay at Chalons-Meudon will follow, pending the construction of the special dock at the eastern frontier town to which the fighting unit will be attached. Some authorities declare that Toul will receive the *Republique;* there are others of the opinion that the registered port will be Belfort. It is certain, in any case, that the Germans will have the war balloon as a near neighbor.

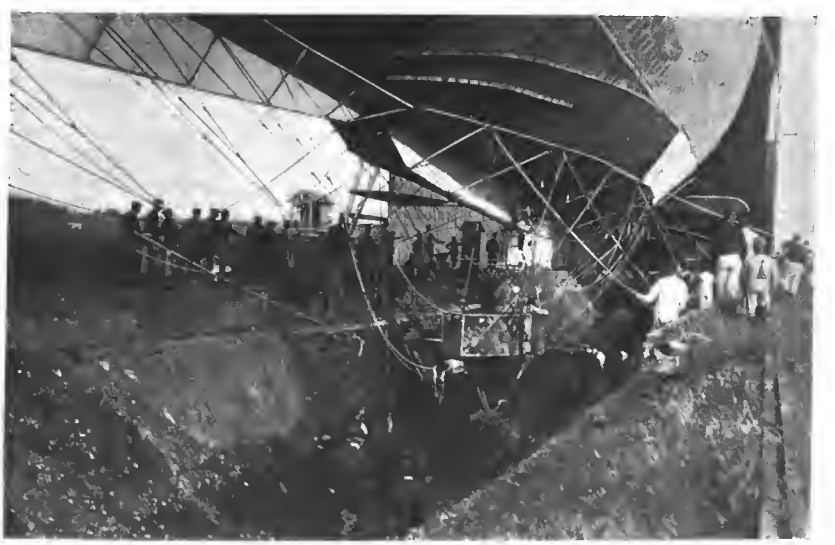
So far as the balloon portion is concerned, George Juchmes has built the *Republique* on practically the same lines as the military dirigible *Patrie* which escaped and was never found. Overall length is 200 feet; greatest diameter is 34 feet; total cubic measurements are 130,000 feet. When filled wtih pure hydrogen gas, the lifting capacity of the balloon is 2,513 pounds. Maximum speed is 31 miles an hour, and the time the balloon can remain aloft at a normal speed without renewal of its gasoline supply is eleven hours.

The power plant of the *Republique* is a 70-horsepower four-cylinder Panhard motor carried in the center of the cage and operating a couple of two-bladed propellers at each side of the airship. A clutch is interposed between the motor and the propeller shaft and a gear-box is provided. The motor has high tension magneto ignition with storage batteries as a stand-by, the gears this time being completely enclosed. As will be remembered it was primarily owing to a mechanic's jacket engaging in the open gears and stripping them that the *Patrie* was lost. The cooling arrangements are identical with those of Panhard touring cars, the familiar type of radiator being carried on the port side of the cage, just behind the propeller.

Extra precautions have had to be taken with the exhaust, for any carelessness in this respect might lead to the entire destruction of the balloon. The manifold is carried out on the port side right opposite the propeller, and is led into a triple muffler, each one having a specially designed radiating surface. The discharge into the air takes place fully astern and under the cage. All gasoline is carried in a large tank with pointed ends suspended to the underside of the cage, the liquid naturally being under pressure. Should any leak take place the fuel would be carried clear away from the cage, thus reducing fire risks to the minimum.

The internal compensating balloonet, the object of which is to overcome the inequalities caused through distention or loss of gas, is normally filled with a pump driven off the motor. As a provision against any possible breakdown of the machinery it can, however, be operated by means of a hand wheel.

An improved feature of the *Republique* is the use of lateral wings by means of which it is possible to raise and lower the balloon in a very large degree without the loss of ballast. An example of this was given on the first trial trip, the airship leaving ground, evolving for half an hour at a height of over 100 yards and coming back to its shed without throwing out an ounce of sand, or having its gas valves disturbed.



"Republique" Returning to Its Shed After Successful Flight.

As soon as the *Republique* has gone through its official tests and been handed over to the military authorities George Juchmes, its designer, will busy himself with the improvement of the *Lebaudy*, one of his earliest dirigibles, and later will commence the construction of the *Liberté*, sister ship of the *Republique*.

The material employed in the construction of the gas bag of the *Republique* is rubbered cotton supplied by the Continental Caoutchouc Company from their German factory. The various sections are fastened together by a sewing machine, the seams being covered by bands of rubber cloth. The interior ballonnet is constructed in the same way, and is provided with four automatic air valves releasing the air when a certain pressure is attained so that the regulation of the extremely important essential of the airship is taken care of without the operator's attention.

DELAGRANGE MAKES RECORD WHICH FARMAN ECLIPSES

MILAN, July 9.—Leon Delagrange still holds the world's flying record, his latest performance having carried him far beyond any of his rivals having made public flights in Europe. At seven o'clock of the evening of June 22, in the presence of a large number of spectators and under the control of an official delegation, the Parisian sculptor started up his Voisin flying-machine, rose into the air without any hesitation, and remained aloft 16 minutes 30 seconds, thus beating his own record of 15 minutes 20 seconds made at Rome.

In connection with the flight it is worth noticing that the flying machine is in absolutely the same condition as when it left the Voisin Brothers' shops. The motor is the same 50-horsepower eight-cylinder Antoinette, unchanged except for a larger capacity water tank. This record performance of Delagrange bears out the declarations of Levavasseur, the builder of the Antoinette engine, that the aeroplanes could remain aloft indefinitely in a calm weather, the length of the flights being entirely limited by the ability of the pilots. When, a few months ago, a three-minute flight was a remarkable performance, Levavasseur maintained that the only obstacle to a flight of as many hours lay in the pilots themselves. "It is not because of lack of water or the using up of the gasoline supply that Farman and Delagrange cannot make longer flights, but entirely because they are not sufficiently trained to remain aloft longer. Flying is an entirely new experience, and at the end of a few minutes the men become afraid."

Levavasseur's theory has been proven correct, for Farman has progressed from six yards to as many miles with the original type of machine and Delagrange has lengthened his flights from one minute to 16 merely by personal training. It is absolutely certain that the prize for a flight of 30 minutes will be captured by either Farman or Delagrange before the summer is far advanced.

It is estimated that the distance covered by Delagrange in his record spin through the air was eleven miles. This, however, is only approximate and is on the supposition that the machine was traveling at the rate of 50 kilometers an hour. As can be readily understood it is a somewhat difficult matter to accurately register the distance covered by a flying machine, especially when the course is a circular one, as was the case with Delagrange, it being out of the question to follow it.

It had been hoped that a flying match would be disputed at Milan between Delagrange and Farman. It has been impossible, however, to arrange conditions and after a couple of days here Farman has left for Paris. Delagrange remains until Wednesday, when he will leave for Turin, in which town he has engaged to make public performances.

According to one authority the public performances of Delagrange in Italy will have netted him a profit of not less than $60,000. In France practically nothing had been gained, for Delagrange just missed the few big prizes offered and never obtained a cent from public demonstrations. It is also declared by the same authority that Delagrange has under consideration a trip to the United States for demonstration purposes, believing that if a tour were organized in the Eastern States it would be a complete financial success.

According to cable advices, Henry Farman has eclipsed Leon Delagrange's record of remaining aloft of 16 minutes and 30 seconds, made June 22, at Milan, Italy. At Paris, July 6, Farman succeeded in remaining with his aeroplane in the air for 20 minutes and 20 seconds, covering a distance of 18 kilometers, thereby winning the prize of $2,000 offered by M. Armengard.

M. Bleriot made an attempt the same day to win the same prize with his monoplane, but succeeded in remaining in the air only 10 minutes and 23 seconds.

FARMAN TO MAKE FLIGHTS IN AMERICA?

Announcement was made in New York papers last Saturday that Henry Farman, the noted French aviator, who has been conducting experiments in France, had signed a contract with a syndicate headed by Samuel Bowman, a real estate operator in St. Louis, to give a series of fifteen exhibitions in this country this summer for $24,600, or approximately $1,600 for each flight that he engages to undertake.

The shows are to be given in enclosures. An admission fee is to be charged, although the press agent avers that the syndicate, which has guaranteed the money to Farman, is entirely altruistic and is "in it" for science and not for profit. The members of the syndicate, however, hail from St. Louis, Mo., that State in which, it is said, everything has to be made manifest, and someone will have to be "shown."

That there is "money in flying shows" is indicated by the fact that a little dissension is apparent already between the promoters of them. The St. Louis syndicate had hoped to sign that other noted European flyer, Delagrange, and to have contests between him and Farman. The first exhibition is to be held at Brighton Beach during the present month, though the French aviator has been having trouble in shipping his apparatus to this country.

BOSTON AERONAUTS TO BUY BALLOON.

BOSTON, July 13.—The New England Aero Club is no longer to be a balloonless organization, as the members, at a meeting, have voted to purchase a balloon. The sum of $615 has been subscribed toward the purchase and it is expected that the balance will soon be in hand. The committee is considering the purchase of the balloon "Boston." It will be located for the present at North Adams or Pittsfield, but later on it is hoped to have a balloon park at Lowell, Worcester or Fitchburg. The club voted to subscribe to the agreement of the Aero Club of America concerning the requirements of a pilot. So far the only qualified pilot of the New England club is Charles J. Glidden, who has made ten ascensions in this country and abroad. Other members who have made ascensions are Professor A. Lawrence Rotch and H. Helm Clayton.

At the meeting Professor Rotch, the president, showed a set of instruments he had devised for finding latitude and longitude while in a balloon. The instruments include a sextant corrected for the horizon and a self-recording barometer giving the height. Mr. Glidden exhibited his ballooning outfit, which weighs 22 pounds, all packed in a case, thus making it extremely convenient to carry around as baggage when traveling.

BAD TURNS MAKE ARROWHEAD TIMES SLOW

NEW YORK, July 13.—As the venue for a hill-climbing course, Depot Lane, which is a twisting thoroughfare connecting the uplands of Washington Heights with the site of Fort Washington on the river, and incidentally with a railroad depot, from which it derives its title, proved not to be all that could be desired by any means. It is only three furlongs, or at least that is all the hill that it can boast, and quick times might well have been expected over such a short distance had not the very bad kink in its upper half, for which the Lane has always been noted, compelled the drivers to practically come to a stop, while the remainder of the course was not sufficient to permit of gathering speed a second time. The event was the first annual hillclimb of the Riverside Motor Club and furnished considerable entertainment for a large crowd in spite of the comparatively slow times.

Bourgue in Knox Setting Record Mark for the Hill.

The Knox cars gathered in several of the principal honors of the day. Dennison, in the free-for-all class, covering the course in :23 2-5—the day's record for time. The next best time was also made by a Knox, driven by W. Bourgue, in :23 4-5. He also won in three other classes, with a shade more of time against him, but giving creditable performances nevertheless.

Frank E. Dunnell's Ford won two other events, while single victories went respectively to H. E. Wagner's Babcock, Tommy Forbes' Overland, and M. Klar's Kelton, all in the taxicab class.

The taxicab contest was the closest event of the day, putting the official stop watch to a severe test, and Kelton got the decision on a fifth of a second's margin to the good, furnishing momentary excitement for the assemblage along the course.

Swan with his Stearns who finished second in the class for cars listed at $4,000 and over, protested the Knox, winner, on the ground that the latter car was catalogued lower than $4,000 and in consequence not eligible to compete in the event in the class with the Stearns. This protest was noted and will be acted upon later, no announcement being made until then.

The American, with Stewart Elliott at the wheel, nearly mixed matters in one event, when the steering gear jammed just as he was about to take the turn. The car headed for a stone fence, but fortunately struck a point where the fence opened into a field, where it was brought under control. Aside from this there were no accidents owing to the extreme caution exercised by the drivers in taking the curve, which is without a doubt by far the worst that any of the most seasoned drivers in hill-climbing contests have had to snake a car around in all their experience, and that is saying a great deal.

Below are the results of the various events.

GASOLINE CARS, $850 OR LESS.

1.	Ford	15	Frank Dunnell	:32 2-5
2.	Maxwell	12-14	W. B. Ladd	1:01 2-5
3.	Gyroscope	18	A. Comancho	1:14 2-5

ELECTRIC VEHICLES, ANY PRICE.

1.	Babcock Electric	—	H. E. Wagner	:41 2-5
2.	Babcock Electric	—	Dr. A. C. McIntosh	:44

GASOLINE CARS, $851 TO $1,250.

1.	Ford	15	Frank Dunnell	:30 2-5

LAUNCHING THE GOOD ROADS CAMPAIGN.

Being the first concerted movement of its kind, much was naturally expected of the initial Legislative and Good Roads Convention of the American Automobile Association which held the boards at Buffalo last week, but not even the most optimistic advocates of uniform and reasonable legislation and improved highways would have cared to commit himself to the extent of predicting more than a fraction of the actual results that have been achieved. Some idea of the widespread interest manifested in the event may be gained when it is stated that not only were the State engineers and other highway authorities from many States of the Union present, but the Federal Government was also represented, thus revealing in an unmistakable manner that the nation as a whole is actually awakening to the importance of improving its vast network of highways.

Had it done nothing more than to call general attention to the fact that legislation in this country on the subject of the automobile is utterly without rhyme or reason, where the majority of the States is concerned, and that a man may constitute himself a criminal merely by attempting to pass from one to another in a power-driven vehicle, the legislative branch of the convention would have justified its existence. But it did a great deal more, and it is quite safe to say that the result of the efforts of the various authorities who gathered to discuss the legal aspect of automobiling will form an entering wedge, the effect of which will be plainly apparent within the next year or two. Contradictory and unreasonable legislation, passed in a spirit of medievalism, is as much out of place in the twentieth century as are the miles and miles of meandering and holey cowpaths, which, through lack of some equally brief and comprehensive term, we are compelled to call roads. Both "retard the progress and development of the automobile and greatly lessen its usefulness," to quote Chairman Terry, and, it may be added, one is as necessary as the other.

Apart entirely from the vast amount of good work that was directly accomplished in the limited time available, on both the subjects for which the convention assembled, its indirect influence in awakening public opinion to the true state of affairs is incalculable. Once the man in the street comes to a realization of the fact that, though he may never be the possessor of one, the development of the automobile and its most important mission, the improvement of the highway, affect him, opposition will melt away as if by magic and results, once so difficult of attainment, will follow naturally from the inertia of the vast force thus set in motion.

* * *

FRENCH RACING PLANS MISCARRY.

It is now in order for the French automobile industry, which controls racing in that country, to institute a new annual classic—one in which French chances will not be 40 or 50 to 1, but 100 to 1. France must be a winner every time. The Grand Prix gave promise of this and the first year results appeared to justify the killing of the Gordon Bennett, but in 1907 a mere tyro at automobile building, Italy, scooped all the honors. That was bad enough in all conscience, but this year, *Helas! C'est a pleurer a chaudes larmes,* the Teutons, the very last people on earth by whom the Frenchman cares to be beaten, took everything there was to be had, and as handily as you please. It is indeed a bitter pill for French pride to swallow that none of her crack drivers of many years' experience was able to cross the line better than fourth.

Galling enough to be beaten by one's dearest enemy under any circumstances, but to be so utterly overwhelmed that there is scarcely a straw of consolation to be grasped anywhere, certainly *"it is to weep the hot tears."* Nothing remains for France but the glory of bygone victories and the necessity for framing up something new. Exactly what form this may take, it is hard to predict, but certainly an excuse exists for changing.

A A A Conventioners and Good Roads Advocates Finish their Work at Buffalo

Delegates Arriving in Front of Headquarters at the Hotel Iroquois.

BUFFALO, July 9.—The second day of the Good Roads and Legislative convention of the American Automobile Association was intensely interesting and marked an epoch in the general progress of automobiling. Owing to the necessitated absence of Chairman Robert P. Hooper, of the A. A. A. Good Roads Board, ex-Governor N. J. Bachelder, Master of the National Grange, took the chair, and carried out to the letter the program prepared by the general committee in charge.

The committee on resolutions was given a hearing and the resolutions presented by Charles T. Terry, chairman, were unanimously adopted. In brief they pledge the National Grange, the American Roadmakers' Association, and the American Automobile Association to work for the election of legislators, national and State, who will support the uniform state motor vehicle law proposed by the A. A. A. and the enactment of the Federal automobile registration law. Governor Bachelder in the opening address raised the points of difference between automobilists and farmers, giving his opinion that obstructive legislation operating against automobile owners has been justifiable to an extent, owing to the coming of the "speed maniac" and his life-endangering use of the highways where the horse is still the prime motive power.

Referring to the alleged road destroying effects of the automobile, he suggested that the facts relating to the effects of automobile traffic on improved roads should be ascertained before raising needless alarm over the alleged destructive tendencies of the inflated rubber tire.

Governor Bachelder then proved by statistics, figures and argument the contention that the motor-driven vehicles would prove an economical transport for the farmer.

In advocating Federal appropriations, the Governor called attention to an unfair division of tax expenditures—the farmers, one of the country's most productive tax-paying classes, not receiving their just share in the expenditure. He said:

"The farmers are determined that this state of affairs shall not continue. They have made up their minds that Congrese must devote a share of the annual appropriations to the construction and maintenance of our roads. Some of ue believe that the creation of a National Highway Commission, with power to organize an efficient corps of trained road engineers, who, in cooperation with the State and local highway authorities, would supervise the disbursement of the Federal granta, would be a highly satisfactory solution of the important good roads problem."

In conclusion he said that Federal aid in road improvement will not lessen the interest of states, counties, and townsbips in this matter. To the contrary, it will have a stimulative effect.

"New York's Highway Code" was the subject discussed by Senator Jotham P. Allds, of New York. He outlined the system of road maintenance, telling of the subdivision of the great work. The Highway Commission consists of three members: a civil engineer and representatives of two political parties—one in power, the other second highest in number of votes cast. For the technical work of general supervision and formulation of plans the State is divided in this division under division engineers who constitute the right arm of the commission in dealing with the work both of construction and repair of the State and county highways. Ample clerical and engineering forces are provided for this general work, and underneath the division engineer is either a county superintendent in case the Board of Supervisors see fit to appoint one or a district superintendent who shall have charge of more than 5,000 linear miles of highway—the district to be erected and the superintendent to be appointed by State Highway Commission. He concluded by saying that upon the adoption of the statute, after it has been strengthened by the recommendation of the commission, citizens of New York will be well assured that they have a piece of constructive legislation covering the entire subject of highways which will be at least the equal of any highway statute in the United States, and under which the $50,000.-

Secretary Elliott Welcomes Pittsburg Delegation, Headed by Secretary Paul C. Wolff, of the Pennsylvania Motor Federation.

Group of A. A. A. Officials Stand for the Camera.

000 granted by the State and the $35,000,000 contributed by the towns and the counties will be honestly, economically and wisely expended; and that by education and due supervision a great advance will be made in the repair and maintenance of roads.

The discussion of "The Improvement of Town Roads" was taken up by Stephen Ryan, State Road Director of New York State Roads. The speaker deplored the lack of a perfect understanding between automobilists and town officials. He said:

If I stood here for the purpose of addressing a body of automobilists, and them only, I think I would try to convince them that their greatest difficulty is that they do not understand the country people and the difficulties they have to overcome in good road building; and I would also try to convince them that they have got to look to these people for the solution of this problem.

If I stood here to talk to a body of town officers and Grangers, and to them only, I think I would try to convince them that their greatest difficulty is that they do not understand the motives of the automobilists and the good that they have done in creating an interest in this work and in getting the money for improvements.

He then described the financial stringency existing in some towns, quoting instances where good road making was badly handicapped by appropriations that ran as low as $100 a mile. Per contra, the town of East Chester, in Westchester County, New York, has $1,138 a mile with which to work its roads.

Perhaps the most encouraging sign of the times is shown in Mr. Ryan's statement that, in 1899, the first year under the money system, $173,000 was spent in the money system towns for highway purposes. Five years later this had increased to $1,291,000. Last year, including bridges and extraordinary repairs, $3,812,000 was spent and we estimate that next year with all the towns under the money system $6,135,000 will be spent on highways and bridges on town roads.

"The Call for Good Roads and the Propriety and Need for Federal Aid," was handled in a thorough manner by F. A. Derthick, Master of the Ohio State Grange. Mr. Derthick, speaking along lines similar to those of Governor Bachelder, said:

An Enthusiastic Good Roads Advocate in His Apperson.

I look forward to the time when the auto will be of practical service in the country, not only in the transportation of our crops from farms remote from shipping points, but in the transportation of our children to the centralized schools of the future, thus obviating the enforced irksome ride of some hours each day over dirt roads that at times are bottomless. The nation has given aid to railways, which has resulted in developing rich sections of our country and placed the United States in the forefront as a commercial nation. This policy was criticised at the time, but whether right or wrong the policy now seems wise, from a business point of view, as it has added billions of dollars to our national wealth. As a tax asset government aid to railroads proved a good investment, for to say nothing of the vast increase in value of real estate, and consequent swelling of the duplicates of the various States traversed by these assisted railroads, the roads themselves have been no mean contributors in meeting public expenses.

The Motor Parkway, Long Island's new special highway for automobiles only, was well described by A. R. Pardington, general manager of the Parkway. His talk concerning this "Auto Utopian" project was immensely enjoyed by his hearers, especially those representing the automobiling side of the assembly.

D. Ward King of the Missouri State Board of Agriculture told his hearers about the treatment of earth roads, during which the split log idea was brought forward and thoroughly explained.

A. W. Campbell, Deputy Minister of Public Works of the Province of Ontario, spoke interestingly on the new road era in Ontario and told of the good work which has been done there in the past and what is proposed in the future.

Of special interest to the grange and farmers generally was the address of F. N. Godfrey, master of the New York State Grange, who spoke on "Good Roads and Automobiling from the Farmer's Standpoint" and who impressed the need of a give-and-take policy and mutual cooperation on each side.

"The Highways of Massachusetts" were discussed by Harold Parker, chairman of the Massachusetts Highway Commission, and James W. Abbott of Nevada, late U. S. Highway Commissioner for the Rocky Mountain and Pacific Coast States, told of the "Road Problems of the Pacific Coast."

The delegates found the press of business on Wednesday morning so great that it was long after the set hour for final adjournment that the hall was cleared. The last hour of the convention was a crush, but President Hotchkiss managed to push through several important matters calculated to forward the Good Roads movement.

Resolutions were readily passed, calling for a convention of the A. A. A. every year, and the following committee on arrangement was appointed to handle the convention in 1909: Robert P. Hooper of Philadelphia, chairman of the Good Roads Board of the A. A. A.: N. J. Bachelder of Concord, N. H., master of the National Grange; J. H. McDonald of Hartford, Conn., president of the American Roadmakers' Association; Charles T. Terry of New York, chairman of the A. A. A. legislative board; S. D. Waldon of Detroit, representing the National Association of Automobile Manufacturers; W. H. Hotchkiss, president of the A. A. A.; and F. H. Elliott, secretary.

The A. A. A., the National Grange and the Roadmakers' Association by resolution have pledged themselves to work for a Federal automobile law, as well as for favorable good roads legislation in Congress, and a committee of 24 appointed to see that the resolutions won't go the way of the New Year's resolve.

The Currier law, now pending in Congress, was unanimously endorsed and the three associations joined in one resolution condemning harmful use of highways by autoists and other users.

Cincinnati wants the next convention and is putting up a strong fight to gain its point. However, no decision on this point was reached and the question was tabled. A committee of nine was appointed to pass on the claims of rival cities. The convention then adjourned sine die.

Good Roads Demonstration a Great Success.

BUFFALO, July 9.—The practical demonstrations of road making and dust suppression were viewed yesterday by the delegates and visitors of the convention. The committee on arrangements was a bit skeptical as to its ability to line up the required

300 cars, but the automobilists of the city rose gallantly to the occasion and the last machine leaving the Iroquois at two o'clock carried but three passengers—one less than its capacity. The line of cars strung out over 25 miles.

Perhaps the most interesting feature of the trip was the exhibition of state road making near Clarence. Here a road was tested in all its stages from a rough country road to macadam boulevard, newly constructed and smooth as a table, was viewed and felt. A section of road is being built here with state aid. The occupants of the cars saw the stonecrusher in operation, gangs of men and teams at work plowing, grading, hauling material and big rollers pounding the macadam into solid road.

Banquet Brings A. A. A. Convention to a Close.

Notwithstanding that the A. A. A. reliability tourists left this morning, the banquet held at the Iroquois Hotel last night was a pronounced success from the attendance standpoint. More than 150 representatives of the A. A. A., the National Grange, and the American Road Makers' Association sat down to a feast that was good to the palate, but more appetizing to the intellect.

Timothy Woodruff, of New York, the first speaker, said he wasn't used to being an accelerator in anything except political gatherings. "Good Roads," he said, "is the most important problem before the American people to-day, despite the fact that some men believe that the merchant marine is of more vital importance. If you cannot travel at sea under an American flag, you can at least travel under a foreign flag, but the highways of the United States are in such condition that you cannot travel them under any flag. The roads of France are two decades ahead of us. It isn't our fault. It's the fault of environment. Europe has grown through her highways. America has grown through her railroads. We've outstripped Europe in everything we've gone in for. We can outstrip her in time in the matter of highways."

Ex-Governor N. J. Bachelder, of New Hampshire, when called upon, said that the National Grange had been working for good roads for several years and, he added, "It's going to keep on working." Governor Bachelder was introduced as the man who controlled 1,000,000 votes for good roads and good roads legislation.

Mayor Adam, a two-weeks-old automobilist, said that he was a lifelong member of the A. A. A., "from now on," he added with an Irish bull, creating gales of laughter.

James H. MacDonald, the popular highway commissioner from Connecticut, president of the National Road Builders' Association, made the wittiest speech of the evening, in which he mingled sound advice with canny Scotch stories.

Senator Allds, who got one of the heartiest receptions of the evening, spoke from the standpoint of the farmer, saying the latter had just awakened to what good roads meant to them. "We recognize," he said, "that we are the fellows who are going to get the most benefit out of good roads. All you motorists get is a little pleasure out of them, but we are going to get the dollars and cents out of them by being able to haul our goods to the market."

George C. Diehl.
Chairman of the Committee on Road Demonstrations.

E. R. Thomas, called on by Toastmaster Hotchkiss to say a word for the Thomas Flyer in the New York to Paris race, said he hoped the time would soon come when it would be possible for an auto to go through to San Francisco without a broken axle or even so much as a punctured tire. The modest maker of the Thomas Flyer, who was the last speaker of the evening, got a warm reception from the banqueters.

The Automobile Club of Canada was ably represented by the vice-president, U. H. Dandurand, who brought greetings from the Canadian automobilists and invited his American brethren to cross the line early and often.

Charles J. Glidden, "of the world," as Toastmaster Hotchkiss introduced him, sketched briefly his foreign tours and the roads over which they had carried him and expressed his pleasure at being present at a convention which was destined to be productive of so much good to the movement in this country.

At the speakers' table, in addition to Toastmaster William H. Hotchkiss, were Powell Evans, president of the Automobile Club of Philadelphia; U. H. Dandurant, president of the Automobile Club of Canada; Congressman W. W. Cocks, Senator J. P. Allds, ex-Lieutenant-Governor Timothy L. Woodruff, of New York; ex-Governor N. J. Bachelder, of New Hampshire; Mayor J. N. Adam, of Buffalo; Highway Commissioner James H. McDonald, of Connecticut; Neal Brown, president of the Wisconsin State Automobile Association; Charles J. Glidden, the globe-girdler; First Vice-President Lewis R. Speare, of the A. A. A.; E. H. Butler, editor of the Buffalo *News;* E. R. Thomas, national Secretary F. H. Elliott, Harold Parker, A. W. Campbell, George B. Ellis and L. W. Page, director of the Offices of National Public Roads.

Some of the Actual Work of Road Building in New York State That Was Inspected by the Conventioners.

MAKERS AND A. A. A. REITERATE 1908 VANDERBILT RULES

IN response to a suggestion made in Paris to tbe foreign affairs committee of the American Automobile Association that the action of the foreign clubs in refusing to sanction the Vanderbilt Cup race of this year would be rescinded if the Racing Board of the A. A. A. would hold such race under the so-called Ostend rules, a meeting of the Central Conference Committee, representing the American manufacturing bodies and the American Automobile Association, was held in Buffalo Tuesday last. Among others who attended, including representatives of the N. A. A. M., A. M. C. M. A. and A. A. A., were President Thomas Henderson, General Manager S. A. Miles, and E. R. Thomas, of the National Association of Automobile Manufacturers, and President W. H. Hotchkiss, Chairman Jefferson deMont Thompson, A. R. Pardington and Secretary F. H. Elliott. The makers were also represented by S. D. Waldon and R. D. Chapin.

After a full discussion of the situation, both domestic and foreign, it was unanimously decided tbat, so far as the Vanderbilt Cup race of this year is concerned, the same should be held under the rules previously announced by the Racing Board of the A. A. A. In the opinion of those present, any other action at this time would be unfair to the American manufacturers, particularly in that it would now be impossible for them to build cars wbich would conform to the so-called Ostend rules; and, also, in that there is no assurance that the foreign bodies will continue to observe the Ostend rules next year. Subsequently, when the report of the Buffalo proceedings was shown to Alfred Reeves, general manager of the A. M. C. M. A., he unreservedly approved all that had been done. Mr. Reeves is just recovering from a hospital operation, and was unable to be at Buffalo.

The hope was expressed, however, that when a proper representation on the committee which shall frame the future racing rules for international contests is given to the American Automobile Association as tbe national governing body in the United States, and as representing more motor users than all of the foreign clubs combined, as well as an industry which turns out more cars annually than any other country, it would be possible to arrive at a formula equally satisfactory on both sides of the ocean, and thus to hold future international events under it.

In this connection it may be stated that besides having promises of at least ten representative American entries, the A. A. A. Racing Board is already assnred of the entry of four representative foreign cars, namely, a Mercedes and a Benz, which stood, respectively, first and second in the French race last week, and a Hotchkiss and a Renault, thus giving, even at this early date, the Vanderbilt Cup race its old-time international flavor.

The course that has been selected is approximately 25 miles long, and is stated by those who are familiar with it to be the fastest in the world, including, as it will, the completed section of the Long Island Motor Parkway and the State and county roads of Nassau county, within an hour's ride from New York.

A. C. A. "EXPLAINS" THE WHYFORE OF ITS FOREIGN RACE.

From the executive committee of the Automobile Club of America comes a statement as to why it thinks itself justified in running a race at Savannah for the foreign manufacturers, which event, it is averred, "would not have been organized if the American Automobile Association had seen fit to make the rules for the Vanderbilt Cup race accord with the internationally accepted conditions." In other words, the A. A. A. Racing Board should have considered tbe foreign makers first, and not American makers, an opinion not likely to be accepted here.

It is alleged in the "explanation" that at the recent Dieppe session of the international clubs "an unsuccessful attempt was made by the American Automobile Association to supplant the Automobile Club of America." The exact facts are that no effort whatever was made on the part of the A. A. A. committee at Dieppe to become affiliated in any manner at this time, it being made clear that an arrangement of any character whatever would carry with it the acceptance of the so-called Ostend rules. The province of the special committee was simply to make known to the delegates that it was the A. A. A. which controlled racing in America and had always conducted the Vanderbilt Cup race, and, furthermore, tbat if any foreign makers participated in the American race, they would have to accept the present rules, unless American makers agreed to modifying them.

The "explanation" is verbose and roundabout, and not in keeping with the facts known to exist, and, taken as a whole, it will accomplish little in relieving the club from the criticism levcled at it from all sides as a result of its present untenable position.

NEW JERSEY CLUB REPUDIATES RUMOR.

According to officers of the New Jersey Automobile and Motor Club, that organization has no idea whatever of resigning from the Associated Automobile Clubs of New Jersey, the State organization of the A. A. A. A meeting of the club is called for to-night, at which the subject will come in for some attention. The source of the rumor is well understood, but the club desires to place itself on record as being in favor of an organization like the A. A. A., which gives a local club local prestige, a State body control in its own State, and the whole framework joined together by national officers elected by the national board of directors selected by the State bodies.

A. L. A. M. STATES IT WILL MAKE DEALERS TOE THE MARK

NEW YORK, July 14.—Although there was no intention of making any public announcement to that effect, at least not for several weeks to come, the report of the fact that the Licensed Association had compelled the Peerless, Olds and Cadillac companies to cancel their agency contracts witb the Centaur Motor Company, Buffalo, on account of the latter taking on the Oakland, an unlicensed car, precipitated matters, and the A. L. A. M. is now making it plain that it intends to compel dealers to respect the agency clause in their contracts. In the past, the rule has not been observed very strictly, as there were so few low-priced cars in the licensed fold that the dealer who wished to have sufficient price latitude found it necessary to go outside. But things have been so shaping themselves in the past year that the licensed agent may now find an ample range under the aegis of the Selden mark, and it is the purpose of the Association to see that he thus confines his choice in future.

When seen at the Association headquarters, Assistant General Manager E. P. Chalfant, who is now in charge, confirmed the report, and stated that a quiet but vigorous campaign to compel all licensed dealers to closely observe the agency clause in their contracts was already under way and would be followed up. "The low-priced licensed car is the key to the situation, and, now that we have it, there can be no occasion for any licensed dealer going outside the fold," said Mr. Chalfant. "We have not been in a position to make too much of the agency clause hitherto, but in future it will be rigidly enforced."

PROGRESS OF THE A.A.A. TOUR.

(*Continued from page 76*)

of its springs in the Saturday run. To-day when three miles out a bumper was made from some old tire casings and inner tubes; and when 20 miles out and the only remaining good leaf broke a block of wood and other parts were used in effecting a repair. It got 181 points on time. The Overland roadster No. 110 ran in hard luck, breaking its frame and having to seek a blacksmith shop, where a repair was effected. As yet it is not known what time the car checked in and what is its penalty. According to the rules as interpreted by Chairman Hower at Sunday night's meeting at Bedford Springs a frame or spring can be repaired in a blacksmith shop providing the work is all done by the driver and mechanic. These two may use whatever tools of the blacksmith's they desire and providing no new finished parts are used the work will not be penalized. This law also covered the manufacture on the road to-day of the improvised bumper by the Franklin. In fact, the rules permit of buying a block of rubber and cutting out a crude bumper and fitting it without penalty. It is reported to-night that Overland No. 108, driven by Mrs. Shirley, will withdraw to-morrow. The runabout was debited 102 points on time to-day, which together with the 9 received on Saturday, gives it a total debit of 111 points.

The Hower perfect scores are now reduced to six, consisting of two Pierces, a Reo, a Premier and two Stoddard-Daytons.

The club and team standing to-night is as follows: Buffalo team one, 1,000 points; Buffalo team two, 1,000 points; Chicago Motor Club team one, 1,000 points; Chicago Motor Club, team two, 997.6 points; Rochester Club, team one, not known, perfect previously; Rochester Club, team one, 1,000 points; Bay State Club, 1,000 points; Cleveland, 663 points; Columbus Automobile Club, 1,000 points; Syracuse Club. 980 points. D. B.

FIFTH DAY—HARRISBURG TO PHILADELPHIA.

PHILADELPHIA, July 14.—By contrast with the two preceding days of mountain climbing and bumping the water breaks over the Allegheny and Blue Ridge ranges, to-day's run from Harrisburg was a restful joy ride. A run of 133 miles in 7 hours over such easily navigable stone roads as those of to-day was mere child's play for the cars. The journey was accomplished without a single perfect score car losing its place on the clean slate. In fact, but a single car suffered penalization. The Moline had hard going with its cracked cylinder, which put a pair out of commission, but managed to get into town around 9 o'clock with its two remaining ones doing the work. It had also stopped to mend its radiator. No 19 miles an hour gait over macadam roads will eliminate the American cars of to-day. The contestants, in fact, for the most part arrived from an hour to close to two hours ahead of schedule time. Then there was some lively scorching, in which the non-contesting cars behaved conspicuously. A seat on the rear was not safe enough to save Ben Smith, who rode as mechanic for Billy Hurlbert, to permit his being tossed out of the Garford's tonneau at the pace this road terror was pushing it. He has a cut cheek and a bruised shoulder as his souvenir.

The little fellows, notably the Reos, are holding up uncommonly well. They stood the mountain banging well, and the law will not allow a fast enough pace to permit their maintaining the time schedule. The Quaker City Motor Club met the caravan at Trappe, and escorted it into town. To-night it is giving the tourists a vaudeville smoker at Horticultural Hall. The Philadelphia *Press* was also in hospitable evidence at Trappe with a luncheon for every car.

The run to-day was through beautiful smiling farm lands. That we were in the land of William Penn was evident by demure old women and modest young girls in white lace caps and soft gray or brown Quaker garb, waving from the porches. The toll-gates were at short intervals, and were picturesque with their grape and flower arbors. In the region of Lancaster, not a few long-haired Mennonites were encountered, and around Reading the Pennsylvania Dutch greeted the tourists with a wee bit of a smile looming through their characteristic stolidity.

The caravan came into town by way of the beautiful Chestnut Hill suburbs, and then down Broad street, through "Automobile Row," to the night stopping place at the Walton. Tom Fetch, Ralph Estep and the freelance Packard made a detour at Collegetown to visit Washington's camp at Valley Forge, which the routemakers had cut out, just as they did Gettysburg, more's the pity. J. C. W.

Perfect Scores for All on the Fifth Day.

PHILADELPHIA, July 14.—For the first time since the start of the tour all of the Glidden and Hower contestants have made the run with perfect scores, there being not a single example of a car arriving late at the checking station or having to make a replacement of parts. This does not include No. 102 Moline, that cracked two cylinders yesterday, and it is not expected to contest for the Hower trophy after to-day. At 8 o'clock to-night it has not arrived, but a wire has been received announcing it at Reading, Pa. Owing to this perfect score day's run over 133.5 miles of rolling macadam roads with occasional water breaks, the team scores in the Glidden contest remain as they were yesterday, which is as follows:

Automobile Club of Buffalo, team 1	1000	points
" " " " 2	1000	"
Chicago Motor Club, " 1	1000	"
" " " " 2	937 2-3	"
Rochester Automobile Club, " 1	666.6	"
" " " " 2	1000	"
Bay State Automobile Club	1000	"
Cleveland Automobile Club	664	"
Columbus Automobile Club	1000	"
Automobile Club of Syracuse	666.6	"

The Hower standing is as follows:

No. 100	Great Arrow	1000	"
" 101	Reo	1000	"
" 102	Moline	949	"
" 103	Great Arrow	1000	"
" 104	Premier	1000	"
" 105	Gearless, withdrawn first day.		
" 106	Franklin, no points, continues as non-contestant.		
" 107	Stoddard-Dayton	1000	"
" 108	Overland, withdrawn, continues as non-contestant.		
" 109	Stoddard-Dayton	832	"
" 110	Overland	698	"
" 111	" withdrawn, continues as non-contestant.		
" 112	Stoddard-Dayton	1000	"
" 113	Blomstrom, withdrawn, continues as non-contestant.		

For Glidden certificates:

No. 16	Stevens-Duryea	1000	"
" 17	" "	1000	"

Although to-day's run is bereft of penalizations, not a few unusual incidents have arisen to be of sufficient import to satisfy the gossipers of the tour for one evening. William Hurlburt's No. 31 Garford, when making too fast time on the stretch of road to-day struck a water-break with sufficient impact to hurl one of the tonneau passengers out, who, landing rather heavily on the ground, suffered a slight scalp wound and a bruised shoulder, neither of which was sufficient to prevent his continuing his tour. The accident was entirely due to reckless driving, which was also noticeable on the part of Van Tyne, driver of No. 29 Garford.

Oakland Car No. 28, one of the contestants in the Chicago Motor Club Team No. 2 for the Glidden Trophy, in taking a water-break too quickly bent the front axle badly. The driver and mechanician sought a blacksmith shop, where the axle was removed, heated, reformed and replaced in 52 minutes.

The Marmon team is making a most favorable impression, as is the combination Premier and Reo teams. The Chicago Motor Club Team No. 1, composed of two Haynes cars and an Oldsmobile, is still in the perfect score category, the cars having run so far without any attention further than the usual overlooking and lubrication. D. B.

LATEST NEWS A. A. A. TOUR.

SIXTH DAY.

MILFORD, PA., July 15.—To-night six of the twelve running days of the Glidden tour are over, and 706.8, or 42 per cent., of the total distance of 1,669.7 miles has been covered. Of the ten teams struggling for the Glidden trophy, six are running with perfect scores, these being as follows: Buffalo team of three Pierce-Arrows; Buffalo team two, comprised of two Premiers and a two-cylinder Reo; Chicago Motor Club team No. 1, made up of two Haynes and Oldsmobile; Rochester club team two, of three Studebakers; the Bay State club team of three Marmons, and the Columbus club team of three Peerless cars. Marmon and Studebaker have teams all of their own, and Haynes, Oldsmobile, Premier and Reo are the four other makes represented. So that with the tour half over there are eight makes of cars still on the ground floor and on equal footing for the trophy. The summarized club standing is:

Buffalo	Pierce	1,000	points
Buffalo	Premier-Reo	1,000	"
Chicago	Haynes-Oldsmobile	1,000	"
Rochester	Studebaker	1,000	"
Bay State	Marmon	1,000	"
Columbus	Peerless	1,000	"
Chicago	Oakland-Rainier	997.6	"
Rochester	Thomas-Gaeth-Selden	666.6	"
Cleveland	Garford	664	"
Syracuse	Franklin	666.6	"

The two Stevens-Duryea cars running for Glidden certificates are in the perfect score brigade still. Of the fourteen original Howers, only five are perfect, namely: two Pierce cars, two Stoddard-Daytons and one Premier.

The tour now has settled to perfection and regularity in every detail; the drivers are not beating it except some of those who are hopelessly out of it, and everybody is as methodical as if living at a Quaker home. The grandstand work of former years is absent, and it is a fight to the finish among all of the contestants. Only one of the observers has dropped out because of sickness, he being the one appointed by Mrs. Cuneo. But three women are in the tour: Mrs. Andrew Cuneo, who drives the Rainier, and with her Mrs. Berwick, and Mrs. Howard Marmon, who rides with her husband in a Marmon car.

In the Philadelphia to Milford run the first car rushed into Milford and stored at the official headquarters, the Bluff House, at 12:35 P.M. It had been a day of excellent macadam roads, and delightful scenes surprised the tourists, who were treated to a ride that will long be in their memory.

The first car was checked out at 7 o'clock sharp, and the day's running time was 6 hours 45 minutes. There was not five minutes of bad road the whole distance. The first 50 miles traversed are over country varying from level to hilly and the balance of the trip, which led through the scenically beautiful Delaware Water Gap, was over narrow roads, with steep hills and numerous sharp, dangerous turns. Despite this, every car in the run came through at high speed. The reception all along the line was most enthusiastic and the summer guests from Delaware Water Gap were intensely enthusiastic in their welcome. The occupants of the cars were given bouquets of flowers, as well as eatables and drinkables.

There were a number of lame ducks strewn along the road, but none of these were in serious difficulties. No. 98, the Premier Pilot car, went down and out a short distance out of Nazareth. The road is being repaired, and the car came along at high speed and dashed into some loose rock that had been piled in the center of the road. The front axle was broken off short.

D. B.

PRESIDENT TISCHBEIN HERE FOR SHORT STAY.

Willy Tischbein, president of the Continental Caoutchouc and Gutta Percha Company, of Hanover, Germany, as well as of the Continental Caoutchouc Company of New York, has arrived from Europe and will spend a short time in the United States in connection with the affairs of the Continental Company. He had some interesting observations to make.

NEWS FROM AMERICA'S RUBBER CENTER.

AKRON, O., July 13.—The Diamond Rubber Company is preparing to make extensive enlargements of its plant, having purchased 14 houses and lots on the south side of Jackson street, opposite from the present plant. The officers of the company are reticent about their plans, but they have already started one building for a machine shop, and have submitted plans to the city for an overhead bridge on the street. The company has been crowded for space throughout the recent busy season in tire manufacturing. It is also the plan of the company to move the Marsh factory here from Columbus, and it is thought that the new buildings are designed for the manufacture of the rims. The new plans include an outlet to the next street south of Bartges street.

The officers of the Motz Clincher Tire Company are well satisfied with business of the past year, and favorable reports were heard at the annual meeting held this week. The following directors were chosen: Charles Motz, Gus Burkhardt, E. J. Alderfer, Nicholas Seil, Howard Haupt, and Paul E. Bertsch. The directors chose officers as followows: President, Charles Motz; vice-president, Gus Burkhardt; secretary and treasurer, Nicholas Seil, Akron thus being well represented.

It is not a matter of common knowledge that women engage in rubber manufacturing in this city, as well as in others, to a large extent, and that there are female tire makers in this city to the number of 35. Valuable and interesting statistics have been gathered by the State Labor Commissioners on the rubber and other tire industries in this city, and the most recent report shows 653 females engaged in the manufacture of rubber goods in seven rubber plants of Akron. What are known as rubber workers proper number 487, and their average annual wage during 1906 was $402.99. The average annual wage of the tire makers that year was $378, and the other female rubber workers and the annual pay was as follows: Forewomen, two; $368.40; helpers, five; $230.25; laborers, sixty-eight; $316.40; pinchers, eighteen; $385.02; packers, six; $351; press workers, fifteen; $280.

BRISCOE'S TRANSCONTINENTAL CHALLENGE.

For the first time in several years the Maxwell cars have not been entered in the A. A. A. tour for the Glidden trophy, and coupled with a statement of the reasons therefor, Benjamin Briscoe, president of the Maxwell-Briscoe Motor Company, issues a *defi* to the winning car. The test, should it be carried into effect, is to consist of an endurance run from Coast to Coast for $2,500 a side, the winner to dispose of the $5,000 purse, and the challenge is aimed at the car which comes out victorious in the tour now under way. The principal reason for the non-entry of a Maxwell team this year is the alleged discrimination against the light-low-priced car of the present revised rules, so that the conditions of the challenge are that it be run under the Glidden tour rules of 1907.

CHALMERS-DETROITS TO HAVE MARSH RIMS.

DETROIT, July 13.—What is doubtless the largest detachable rim contract ever placed by a single manufacturer of automobiles has just been negotiated by the Chalmers-Detroit company with the Diamond Rubber Company, Akron, O. It calls for sufficient rims to supply the output of 2,500 Chalmers-Detroit, 30-horsepower cars for 1909. It is said to be one of the first, if not the initial large contract for 1909 accessories. The sale of Marsh rims this year has been practically doubel that of 1907 and indications at present point to a much increased demand from now on.

A new automobile factory is to be located at Moline, Ill. It is the Velie Motor Vehicle Company, and will manufacture gasoline, electric and steam cars. All the promoters are connected with the Velie Carriage Company. They are W. L. Velie, O. E. Mansur and S. Harper.

HOW THE TIED CARS WILL CONTINUE

THE STRENUOUS MOTOR BATTLE TO A FINISH

SARATOGA SPRINGS, N. Y., July 23.—Twenty-three American touring cars and five American runabouts this afternoon completed with perfect scores what was known as the "Fifth Annual Reliability Tour of the American Automobile Association." No more trying task has ever been asked of automobiles than this 1,675-mile run which started at Buffalo and finally has reached here after traversing Pennsylvania, New York, Massachusetts, New Hampshire, Maine and Vermont. Herewith is the honor roll:

Touring Cars.—No. 1, Pierce; No. 2, Pierce; No. 3, Pierce; No. 5, Peerless; No. 6, Peerless; No. 7, Peerless; No. 19, Haynes; No. 20, Haynes; No. 13, Franklin; No. 14, Franklin; No. 16, Stevens-Duryea; No. 17, Stevens-Duryea; No. 24, Studebaker; No. 26, Studebaker; No. 35, Oldsmobile; No. 21, Marmon; No. 4, Reo; No. 8, Premier; No. 10, Gaeth; No. 11, Thomas; No. 15, Rainier; No. 27, Oakland; No. 30, Garford.

Runabouts.—No. 100, Pierce Arrow; No. 103, Pierce Arrow; No. 107, Stoddard-Dayton; No. 112, Stoddard-Dayton; No. 104, Premier. (These five contended for the Hower Trophy.)

Three club teams are tied for the Glidden trophy: Buffalo—No. 1, Pierce; No. 2, Pierce; No. 3, Pierce. Columbus—No. 5, Peerless; No. 6, Peerless; No. 7, Peerless. Chicago—No. 19, Haynes; No. 20, Haynes; No. 35, Oldsmobile. The last named car is being driven by Andrew Auble, of Akron, Ohio, who says to-night he must return home because of business matters. Therefore, if he does so, the Haynes pair will be unable to continue, which means that the Buffalo Pierceites and the Columbus Peerless team will fight it out if it takes all Summer. That plan is the program to-night and in the morning these two teams and the five tied runabout contenders will continue the motor-driven battle, first going to Buffalo and then starting anew over the route of the tour.

Chairman Hower, and globe-girdler Glidden express great satisfaction at the result of the tour which they consider an unquestioned and convincing triumph for the product of the American industry.

The City of Springs gave the tourists a warm welcome at the conclusion of the twelve-day journey. Great crowds thronged the main street to greet the dust-grimed caravan and the Saratoga Automobile Club supplied an appreciated luncheon in the court of the Grand Union Hotel, before which Chairman Hower's pacemaker drew up at 2:36 P. M. followed by a dozen contending pursuers. The car had left Bethlehem, N. H., at 5:18 A. M. and kept to its schedule all the way. Outside of Rutland 115 miles from the start, the contestants caught the pacemaker. The terror of to-day's 184-mile run had been dinned into the caravan since the tour began and a knockout was feared on the 9 hour, 20 minute schedule set for the trip. But for the teriffic climb up and coast down the Green Mountains with water breaks innumerable the route was not a sufficient handicap to stop any of the indomitable auto pack from schedule making. From a scenic standpoint the run was quietly picturesque. It see-sawed across the Connecticut river between Vermont and New Hampshire and skirted and climbed the Green Mountains

Three Pierce Arrows—The Perfect Score Team of the Chicago Motor Club.

enroute. Then it entered New York in the pretty Lake Champlain region and followed the foothills of the Adirondacks into Saratoga over a macadam wind-up of several miles. Hospitality galore was extended enroute.

The only car to drop out of the strenuous game on the concluding day was No. 23 Marmon, driven by Howard Marmon, with a cracked cylinder casting at about half the distance and immediately withdrew. Several noteworthy performances in the tour deserve special mention. Mrs. Cuneo drove her Rainier with a perfect score, a feat in woman's participation in automobiling that is historic. That one of the Chicago Motor Club's teams made up of $2,750 cars, two Haynes and an Oldsmobile, should have finished even with two of the highest powered and priced trios with the small handicap allowed them under the rules, was a significant achievement for cars of medium cost and power. R. M. Owens' piloting of a little two-cylinder Reo touring car into the perfect score division, thus repeating his performance of last year, was another praiseworthy effort.

The performance of the Pierce and Peerless trios was marvelous in its perfection. A record that is unequaled in the annals of touring contests is that of W. S. Stroub, who not only drove his Peerless without an adjustment but without even pumping air into his tires. A. G. B.

Columbus Automobile Club's Team of Perfect Score Peerless Cars.

THE ELEVENTH DAY.

BETHLEHEM, N. H., July 23.—As a result of the pranks of the weather man, the tourists had an easier run of it today than the powers-that-be had intended to frame up for them. It rained last night, and before Chairman Hower started out in his pace-making car this morning it looked more than merely threatening, the prospects being such that Mr. Hower was certainly justified in changing his fair-weather schedule of 6:40, that had been slated for the day, to a rain time-table of 7 hours and 30 minutes. It did begin to come down a bit between the intervals of the start, which was delayed until 7:30 A.M., owing to "Sunny Jim, the confetti tosser," not having been routed out of his downy couch in good season. Bad weather was imminent up to 10 o'clock, but after that the sun god put Jupiter Pluvius to flight and gave glorious sunshine and dry winds from the fifty-mile point on to the night stop at Bethlehem.

The run was one of varied beauty, retracing for a dozen miles the Rocking Horse hills through the thick woods of yesterday. Farther on the caravan struck the Androscoggin, and bowled along its banks for some fifty miles. Then the tourists entered the White Mountain region and skirted the bases of the steep green slopes and cloud-enveloped peaks of the Presidential range. The road surface was excellent, though a bit soft in spots. The route passed through scores of resort towns and by summer hotels, where pretty girls in swarms and, in fact, the whole countryside turned out to convey a greeting to the fleeting cars.

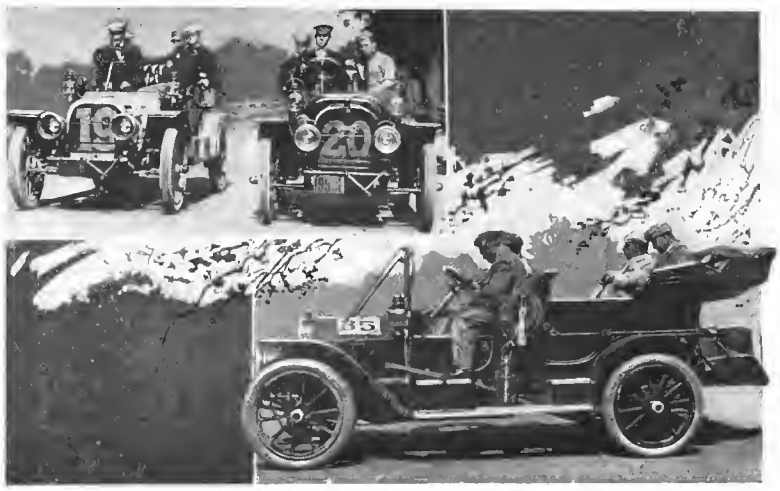
At the Sinclair House, at Bethlehem, the many tourists found a bed apiece waiting them, and turned in promptly, a number turning out early enough the next morning to view the fine scenic environments of the highest turn in New England. Throughout the tour there has been reiterated in joke the query, "If anything should happen to Hower?" and something did happen to Hower to-day. As he was bowling along in the pace-making car at the easy pace called for by the schedule, Winchester's Great Arrow encountered a team of skittish horses, and in giving them a wide berth the inside wheels of the pace-maker ran close to a sandy bank with a drop of six feet. The edge crumpled and gave way. Hower was thrown out and rolled down the bank into a wire fence, while Glidden jumped and had a roll all to himself. The car tilted acutely but did not go over, or there might have been a tale of a crushed chairman and a flattened out trophy-donor to tell. Just then Teddy Day caught the advance guard and Hower went aboard, continuing his pace-making in schedule time.

The resourceful Tom Fetch happened to be behind the pace-making car with the "El Toro" Packard. Tom got busy at once. He dug a trench for traction, called for volunteers to hold the car from toppling over, attached a wire cable, and then started the Packard. In the first attempt the cord snapped, but the second try was a success, and landed the Great Arrow on *terra firma* in a jiffy. "Good Samaritan I am" had no chance to rescue unfortunates in this tour. Last year he pulled a car out of a canal, and the year before went to the

relief of several parties stranded for bait on the course. To-day was Tom's first busy day, for to-night he started out to bring in Billy Hurlbut, whose tin axle had again given out, near Gorham, and to pick up the crew of Marmon, No. 22, which was down and out 59 miles to the rear, with a broken wheel which put it entirely out of the running.

Mrs. Cuneo's Lively Driving.

Mrs. Cuneo, by the way, was so long delayed at Rangeley adjusting a fan that she had to drive her Rainier 130 miles in 5 hours and 25 minutes to save her clean score. No clean-score cars left any points to-day, and a run-off of Glidden and Hower trophy ties is so certain that the chairman, at to-night's meeting, requested those tied for places to meet him at the Grand Union to-morrow night to arrrange the details of the run-off, which he hopes to be able to begin Friday morning. J. C. W.



Chicago Motor Club's Perfect Score Team—Two Haynes and Oldsmobile.

HOW THE SCORES SUFFERED ON WEDNESDAY.

BETHLEHEM, N. H., July 22.—No perfect-score cars suffered on to-day's run of 130 miles from Rangeley Lakes here, through the White Mountains, but in all fourteen cars had difficulties of one nature or another. No. 22, Clark's Marmon, that had brake trouble yesterday, broke a wheel to-day when it took a ditch near Bethel, seventy miles out, the report being the trouble was caused when turning out to pass a team. This car is not in yet, and took the full 1,000 count of debit marks. It will complete the run to Saratoga as a non-contestant. No. 28, Oakland, got nine points on time caused by being late in leaving Rangeley this morning. The car had hard luck yesterday, breaking a spring, and having to take up the connecting rods to-day. It made slow time throughout the majority of the trip.

Tuesday had been cloudy, and rain that had threatened all day started to fall about six o'clock, and continued in a perfect downpour all during the night. The schedule had been announced as six hours and thirty minutes.

Mr. Hower did not start until half an hour after his regular time, and the competing cars were not allowed to check out until 7:30, instead of 7 o'clock. It was noticeable that, despite the fact that the rain had stopped, the big cars were not as anxious to be checked out first, as they had been in fair weather, and held back. All of the entrants seemed a little inclined to let someone else go first and break the roads for them. The Pierce team was to the forefront and got away early, and brave little Mrs. Cuneo followed close behind. All of the entrants immediately after checking out stopped to put on their tire chains, some of them putting chains on both front and rear wheels, in order not to take any chances in the mountain roads, which were reported to be in very bad condition. This report proved to be without foundation, in fact, however, for the roads proved to be as good and in many places even better than those met on any stage of the run except the trip from Albany to Boston. Apart from one or two showers there was no rain to speak of during the day, and the mountain roads, which had dried up very quickly, were excellent.

The route led from Rangeley to Madrid, retracing Tuesday's route to this point, to Weld, Dixfield, Mexico, Rumford Falls, Rumford Centre, Rumford Point, Hanover, Newry, North Bethel, Shelburne, Gorham, Randolph, Cherry Mountain, Carroll, Bethlehem Junction and Bethlehem.

The day was one of many mishaps, and Mrs. Cuneo had to do some fast driving to keep her perfect score intact. She lost an hour in taking the fan belt off her machine and patching it, and as a result had to make the trip over the mountains at high speed. She made the last eight miles into Bethlehem in 14 minutes. She was ahead of time, and checked in amid the cheers of the guests who lined the hotel porch, and the loud applause of the tourists.

No. 110, Overland, went about twenty miles out of Rangeley on a narrow mountain road, dropped into a deep hole, and the rear axle was snipped off close to the spring seating. A fence rail was secured and the machine was pried off the road so as not to block the other cars. Repairs will be made and the car will endeavor to join the tourists in order to be in at the finish at Saratoga.

No. 24, Studebaker, met with an accident near Shelburne, which came very near putting both it and its passengers out of commission. The road approaching a sharp but hidden turn to a bridge was particularly good. The car came along at high

Bay State A. A. Team, Two of which Were Unlucky Near the Finish.

speed, and the driver was almost on the turn before he saw it. He was unable to slacken the speed of the car a great deal and took a chance, swinging the corner at high speed. The machine skidded, nearly went over, and, before the driver could regain control of it, crashed into the bridge. The car continued after replacing a tire, which was torn off when the skid occurred.

Car No. 18, the Gabriel Horn Oldsmobile, skidded when a few miles out of Rangeley, and, striking a stone in a ditch, bent its rear axle. Driver Foster managed to run the car to Bethlehem, despite the fact that one of the rear wheels was badly out of line. He took it to a blacksmith shop and made repairs. Car No. 101, one of the Reo entries, was slightly delayed as a result of the necessity of tightening up its transmission.

Car No. 23, Marmon, was delayed by tire trouble, but finished on time. No. 111, Overland, was delayed on route as a result of the necessity of making adjustments to its engines.

No. 4, Reo, went to a blacksmith shop and repaired a broken rear axle truss rod. A number of the machines are running with broken or missing parts. Van Tine's Garford has no starting crank, and it is necessary to push the car until it gets under headway and then throw in the gears in order to start the engine. No. 24, Studebaker, has its oiler driving gear broken and is splash oiling its engine. No. 12, Franklin, is running under the same conditions as a result of a broken oiler-pipe.

In keeping with a desire expressed by the tourists that they be allowed to check out at 6 o'clock for the last day's run instead of 7 o'clock, the usual hour, in order that they might reach the finish line early on Thursday, the cars will check out in the same manner that they did at Buffalo, *i. e.*, in the numerical order that their entries were received. This is to avoid any friction as to which cars are to go into Saratoga first, and will prevent racing to reach the finish line. The competing cars will be held up a few miles out of Saratoga by the chairman, and will go into the city in numerical entry order in one line to the finish point at the Grand Union Hotel.

Time Schedules, Tuesday, July 21.—Poland Spring to Rangeley, 142.7 miles, schedule seven hours twenty minutes.

STORY OF SEVENTH DAY—MILFORD, PA., TO ALBANY, N. Y.

ALBANY, July 16.—From Milford, Pa., to New York's State capital it is 158.5 miles. The time schedule required it to be made in 8 h. 15 min., a 19-mile-an-hour average. A proviso was made, however, there being clay roads from Kingston on, that, should it rain, which would make the going greasy, the schedule should be cut down to 9 h. 30 min. The weather clerk was in good humor, though, so the first schedule went.

The run was as easily made as have been all the others. As a matter of fact, the prevailing maximum speed limits of 20 miles an hour are proving over any sort of fair going utterly inadequate to hamper even the small cars in the contest. It must be a bad accident entailing a long stop that will prevent a car making up any delay that does not extend too far over one hour. The talk is that next year adjustment as well as replacement penalties may have to be added to secure more rapid elimination and not permit as many teams and runabouts evolving tied with perfect scores as at present seems likely when Saratoga is reached. In a word, American cars as a rule can now beat any speed limit that the laws will permit.

Buffalo's No. 2 Team Loses Its Place.

Another team fell a victim to-day to the fortunes of war. The Automobile Club of Buffalo's No. 2 trio lost its place in the front line through Premier No. 9, which was driven by Joe More and had H. O. Smith aboard, meeting with an accident at Kingston. In rounding an unexpected hairpin turn, which had fooled not a few of the drivers, Moore gave his steering gear too hard a wrench and put it out of commission so far as a repair within schedule time went. New parts not carried on the car, in fact, had to be used, which, under the rules brought disqualification. Mr. Smith received unanimous and sincere condolences, for he has been one of the most liberal supporters of the tour, having entered two touring cars and a runabout, and supplied a pathfinder and pilot car and a press car besides.

It was a glorious ride of 59 miles over fine stone roads from Milford to Newburgh, which continued with the same highway conditions to Kingston, 37 miles further on, the run to the Hudson being over picturesque hills and through farm lands fair to the eye. It gained in grandeur and variety during the ride to Albany, which was along the Hudson all the way. One had magnificent panoramas of America's Rhine and, landward, of the distant Catskills that lifted their heads through the light clouds that hovered over the western horizon.

Take the West Bank to Albany Hereafter.

It converted many to the west bank route to Albany, which has been too generally and ignorantly decried and avoided. It presents more open and picturesque country than the opposite shore. There are fine stone roads all the way to Kingston and from there on, as has been stated before, the clay roads are by no means bad except in wet weather. No finer route to the Delaware Water Gap from New York could be had than via Newburgh and Milford, which could be used, by the way, to avoid the repetition of the route more generally followed through New Jersey.

The men aboard "El Toro," the Packard press car, enlivened the early stages of the day's run by starting at daybreak and putting up good humored josh signs. On one tree was the query, "If anything should happen to Hower?" followed a hundred yards further on by "What the h—l do we care?" A sign "Toll Gate" in front of a saloon fooled many. A pond bore the sign, "Franklins, stop here," and on a rough shack was the notice, "A bath with every room." On a rock was painted "Cheer up, it ain't half bad"—Dai.

The Packard car got in later than usual, the outfit as a rule starting at the end and loitering along the way for luncheon, photographs and a good time generally. A story was put in circulation and on the wire that it had broken down and that its passengers had come in by train. The fact was that it had ripped off a tire in passing another car on a rough hill, stopped to replace it and loafed the rest of the way in. The story savored of the malicious, as inquiry would have easily disclosed the facts and proved by witnesses that the car deposited its passengers at the Ten Eyck between 8:30 and 9 o'clock. J. C. W.

TECHNICAL STORY OF THE MILFORD-ALBANY JOURNEY

ALBANY, N. Y., July 16.—To-day saw the blighting of the hopes of the second Buffalo team for the Glidden Cup, the No. 9 Premier touring car dropping out because of a broken steering knuckle, which occurred at the sharp turn out of Kingston. The car was delayed until the piece was welded and new parts used in the repair obtained, the result being 1,000 points against the car and the club standing lowered to 666.6 points. It appears that in this axle and steering parts, as well as in the front axle of the Premier Pilot, which broke in the Philadelphia-Milford run, chrome nickel steel was not used, as the axles were among the early ones and were deemed equal to the tour, not being used in the cars regularly sold. No. 28 Oakland, which bent a front axle earlier in the tour and visited a blacksmith shop, where it was heated and reformed, to-day developed a little sagging, which occasioned a quick repair. A length of square steel shafting one inch to the side was positioned under the axle extending from the steering knuckle jaw at one side to the same point at the other side. This was bent in the form of a strut rod and a piece of wood placed between its center and the axle. This done, plentiful wiring bound it to the axle, and the driver is confident that the member will give no further trouble before Saratoga is reached. The two Oakland touring cars are making a most favorable impression in the tour, carrying their four passengers every day. Both would have perfect scores had it not been for the carelessness of the driver on No. 28 allowing his motor to run dry and burning out a connecting rod bearing. The morning of the start from Buffalo many predicted that these newcomers in the field would be out of the running before Pittsburg was reached, but they are both making schedule time and are daily gaining in favor. They are demonstrating the value of the balanced two-cylinder vertical motor, which is without adherents in this country except in the Oakland and Brush ranks, but is very popular in French, English and German factories.

Radiator Troubles Have Been Frequent.

Gus Buse took occasion on to-day's easy run to repair his leaky radiator on the Thomas six. The radiator was removed and the leak discovered in the base. The soldering was quickly done, and forty-five minutes from the time the car was stopped it was ready to resume the trip. Radiators have given not a litlte trouble on the tour, and in the majority of cases it appears to be the system of support that is in fault, rather than the radiator construction, because the leaks are in the base plate or adjacent thereto. This condition suggests the ball-and-socket trunnion support that already has a few supporters.

Franklins Enjoy a Climb

Mrs Cuneo Gives Rainier a New Tire

In the Berkshires

Enough said

Arrival in Quakertown

A hasty look over the cars on their early arrival at Albany failed to disclose any evidence of the long daily runs, although nearly every driver had something to say on tire troubles. Wagner, driving Haynes No. 20, said that since he left Buffalo he has not touched a tire, not even having to put any air into them. Arthur Kumpf, driving a No. 2 Pierce, had his first puncture to-day and made the first change of a casing, replacing the punctured one, which was badly worn. The Rainier driven by Mrs. Cuneo fared badly, having a puncture and a blowout and requiring thirty-eight minutes for the two, which repairs were made with the motor running, thereby adding the lost time to the schedulc. The majority of drivers avail themselves of this rule and prefer to keep the motor running while repairing tires.

A Long Line Up to Check In.

The cars reached Albany at 2:40, Chairman Hower's Pierce leading, and closely folowed by the Gabriel horn Oldsmobile that is used daily to escort the leaders into the city. Many cars caught the pacemaker before Kingston was reached and, of course, had to trail him to Albany. In order not to enter too early a long halt was made several miles out, from which point the caravan cntcred in procession form. Pierces, Marmons, Stevens-Duryeas and Garfords were among those to enter with the pacemaker. Before these drivers could get their cars backd up to the curb in front of the Ten Eyck Hotel to await checking in, Burman, with his Peerless team, had arrived; Frank Nutt and Wagner with their Haynes had entered, closely followed by Aubel, in his Oldsmobile, a running mate of the Haynes machines; the Stoddard-Dayton runabout with a couple of others also entered. Van Tine's Garford lost its starting crank during the run and one or two complaints were heard regarding his passing contesting cars at too fast a clip, but no kicks were registered with the officials in regard to the matter so that no official notice has been taken. D. B.

ON THE EIGHTH DAY—FROM ALBANY, N. Y., TO BOSTON

BOSTON, July 17.—Boston, well represented by the Bay State Automobile Club, gave the caravan a warm welcome to the "City of Culture." A squadron of cars flying its colors rode out to Auburndale and lined up to greet the incoming tourists and escort them down the broad esplanade, Commonwealth avenue boulevard, into town. Mrs. J. S. Hathaway bore a magnificent bouquet of flowers which she presented to Mrs. Marmon, who is riding in a Marmon of the Bay State team. At the Somerset, which is the tour headquarters, Mayor Hibbard welcomed the tourists on behalf of the city and Lewis R. Speare, ex-president of the club, grected them in the club's name.

With good gravel roads through New York for 37.7 miles to the State line, and magnificent macadams the entire way across Massachusetts, save for a detour of some 22 miles between North Wilbraham and Warren, the day's run of 154 miles was easy of accomplishment in the 10 hours set by the schedule. There had been warnings of speed traps and inflexible automobile blue laws that caused fear that prison bars might be the bar to some one's perfect score. There was in consequence a close lookout for warning speed signs, but motorists en route only warned inquirers against Leicester. A very long, slow zone, much of it through widely scattered houses, was found through which the cars crept at a timid funeral pace. The outfit escaped the day's run with "unpinched ranks."

The day's run, however, put the Rochester Automobile Club's team out of the leading division. While crossing a rut at Warren, the rear wheel of Studebaker No. 25 collapsed. Its driver, W. G. Jones, had so long a wait for a new wheel he had 'phoned to Springfield for, that, though he was at the time an hour a half ahead of his schedule and made a fast run into Boston, he arrived 1 h. 4 min. late. The new wheel, however, would have disqualified him anyhow.

No more peacefully picturesque run could be picked out than that of to-day. The route carried one into the Berkshires at historic old Stockbridge, where Jonathan Edwards preached to the Indians and wrote his famous philosophical essay on "The Freedom of the Will." Then came a ride down the Housatonic valley, widely famed for its scenery. "Jacob's Ladder" was coasted, or, more properly, bumped down. Then came the Connecticut river, leading the caravan into Springfield.

The Springfield motor car industry rose to the occasion, and hospitably stopped the tourists to treat them to a liberal luncheon, provided by the Fisk Rubber Company, the Stevens-Duryea Automobile Company and the Knox Automobile Company. All but one hurrying car stopped for it, too. It was the first midday meal most of the contestants had had on the tour, and was a welcome change in the daily life of the tourists.

Worcester reached, the splendid macadam boulevards extending for 40 miles into Boston was ahead, with speeding temptations hard to resist. The 10-mile homestretch was through a string of Boston's beautiful suburbs down the glorious Commonwealth avenue parkway to the Somerset. J. C. W.

WHAT HAPPENED BETWEEN ALBANY AND BOSTON

BOSTON, July 17.—To-day's run of 194 miles from Albany to Boston, by way of Springfield, changed the aspect of the Glidden tour contest by the elimination of the Rochester Club team No. 2, of Studebaker make up, the member of this team to fall by the wayside being No. 25, driven by Jones, which wrecked its left rear wheel when going down a curving grade in the town of Warren, 127 miles out of Albany. The wheel had suffered a partial fracture earlier in the tour, and was looked upon by many of the tourists to be due to go out before the end of the week. The accident occurred about the center of slightly curving right hill. A sidewalk crossed it about the middle of the descent, and it was at this point the wheel gave way, every spoke being broken or twisted off at the hub. P. Estey, one of the Chicago newspaper representatives on the car, was thrown out of the tonneau when the wheel broke, and suffered an injury to his left leg, but was able to take a train to Boston, and will continue the tour. The car was pushed to the side of the road until a new wheel was secured, after which it continued the run to this point. The accident cost the entrant the full count of 1,000 points, which was a debit mark of 333.3 marks against the club, and gave it a credit standing of 666.6 marks. The car will continue the run as a non-contestant.

The elimination of the second Rochester team narrows down the Glidden trophy struggle to four teams, namely, Pierce of Buffalo, Peerless of the Columbus Club, Marmon of the Bay State Club and the Haynes-Oldsmobile team of the Chicago Motor Club. Prediction is rife here to-night that before Saratoga is reached at least two of these will be eliminated, leaving but a couple of perfect score teams for the committee to wrestle with when the end of the run is reached. This is largely a matter of speculation, and it is an even break among

the four remaining teams. In all of them the cars are running in the best possible condition, and the drivers have settled down to the strenuous task of forgetting speeding and keeping only the schedule before them. Three teams, Pierce, Peerless and Marmon, being composed of cars of one mark, are able to do more club or team work than the Chicago Motor Club team, composed of the Haynes cars, driven by Nutt and Wagner, and Aubel's Oldsmobile. It must be said of the only combination team remaining that excellent work is being done by these cars; the drivers are equal to every emergency, and the performance of the machines is the best that could be looked for in a contest of this nature.

Resourcefulness of the Factory Drivers.

To-day's run developed but few mechanical difficulties, due primarily to the easy schedule, of less than 20 miles per hour, with extra time for tire troubles. No. 16, Stevens-Duryea, suffering with a slight radiator leak, took advantage of the easy pace, and removed the radiator in front of a tin shop at Leicester, and with the aid of soldering iron welded the leak, which was at the base where the stud holding the radiator in position enters the base plate. An anxious mob gathered around to watch how quickly jobs of this nature can be done. Scarcely was the hood up before the two hose connections were off; a moment or two later the fan supports were detached, after which little remained but to lift the member out of position. By this time the two soldering irons were hot, the mechanician had the solder and acids ready, as well as a file to roughen the surface, and in a few minutes the radiator was repaired. At this juncture the *Motor Age* Reo, which had halted to watch the job, pushed ahead, and within an hour the repaired Stevens was up with it and pushing on at rapid pace towards Boston.

Another good example of the resourcefulness of the drivers and mechanics was evidenced entering Boston. Frank Nutt, in his Haynes, in taking some of the rough roads had struck the truss rod supporting his axle on a projecting rock and injured it. A halt was made in front of a blacksmith shop. In an instant Nutt had sized up the situation and decided the quickest way out of the difficulty was to make a new truss rod. The raw stock was soon cut to the required length, threads were cut on each end, the center bend was made, and then suitable nuts for the ends. This done, the positioning of it in the axle should have been a brief task, but was lengthened owing to the rod being a bit long. Once more Nutt's blacksmith ability was equal to the occasion. He hurried into the blacksmith shop and made a pair of heavy washers out of a length of small rod. These did the desired work, and the car was into Boston and had a long wait with the others before checking in time arrived.

How the Cars Are Groomed at Stops.

The stop at Springfield, Mass., 94 miles out of Albany, gave the public an excellent opportunity of observing the care bestowed on the cars by the driver and mechanician at each stopping point. *Motor Age's* Reo made an early start from Albany, and, averaging 20 miles an hour during the entire 94 miles, including the crossing of the Berkshires and climbing Jacob's Ladder, was into Springfield half an hour ahead of the chairman's car. With the chairman came a group of seven, five contestants and two press cars. Close behind Chairman Hower's Pierce was the Premier Century car, that had followed all the way out. Grouped behind were the two Marmons, followed by the entire group of five Pierce machines. It was most inspiring to see the two Indianapolis machines come in together, and more so to see the five cars on which Pierce reputation is staked enter in a bunch behind them. A little later came Burman with his No. 5 Peerless, and not far behind were two other Peerless machines. Mrs. Cuneo with her Rainier was an early arrival, and, on entering, she received her usual cheer. Scarcely had any of the cars halted before both sides of the bonnet were raised and the inspection and lubrication began. The floor boards in nearly every case were lifted out and a careful investigation made, followed by copious use of the oil can. Oilers were filled in the majority of cases; the Franklins injected oil into the crankcases as well as looking after the valve actuating mechanism; Mrs. Cuneo was on her knees oiling steering gear parts, while her mechanic took the magneto off and cleaned it thoroughly. In two or three cases the mechanic got on his back under the machine and examined every nut or bolt that there was a possibility of working loose. One enthusiast, after having gone over the entire machine, was not content until he had rearranged all of the tools in the tool box, his only excuse being that they rattled a little, and he thought the rattle might interfere with his following closely the working of the different parts of the car.

Oil Is Being Used Liberally.

It can be noted that more oil than necessary is being used in the majority of cases, and when the cars pull out of a control they are immediately lost in a cloud of blue smoke. Spring shackles are oiled with the utmost regularity; so are steering gear parts, and at these half-way stops compression grease cups are given a turn or two. The majority of the drivers and mechanics, when asked about it, say it is not necessary, but supplement this with the remark, "I am not taking any chances." While oiling and inspection are being done, the third passenger in the car is superintending the filling up of gasoline and water tanks, the rules being modified to permit of this. Many of the cars do not take on water except at the night stop. When asked, Paul Gaeth, driving his Gaeth car, stated that he never takes on water except at night stops, when practically all of the cars do. There are exceptions to the rule. McGuire stated at Albany that he had not taken a drop of water between Buffalo and Albany. The radiator question is much improved over a year ago, when the sight of steaming radiators in the mountain work was a frequent one. This prompts a slight digression regarding water jacket space. Many cars built in level States have in past years had radiator and jacket sizes designed for continuous use on rolling and hilly roads, but which capacity was inadequate for miles and miles of mountain and low speed work. Previous Glidden experiences have rectified this difficulty. The value of previous tours has so improved the brakes of cars that not a single case of hot brakes and the application of water and oil has been ferreted out.

Throwing Things Proves Dangerous Welcome.

What might have proved a serious accident happened to James McLean, observer in No. 14 Franklin. When passing through West Springfield, one of the enthusiastic maidens who lined the roadside to applaud the tourists threw a small apple, which struck the glass of his goggle, breaking it and causing three of the broken pieces to cut the eyelid. A doctor stitched the cut, and with a well-bandaged head McLean completed the trip. One similar example to this occurred when passing through Springfield, O., in the tour last year. The chairman could do good service by having the local press in communities along the road give warnings on this dangerous practice.

Van Tine, in No. 29 Garford, had a narrow escape on one of the sharp turns. He sped down a long hill, the foot of which is a sharp turn. In order to avert a collision with a buggy, the brakes were all applied, and the car, after almost turning around, skidded into a ditch, tearing off a tire. No further injury was caused. Hurlburt, driving No. 31 Garford, took a bridge too fast and struck the railing, ripping off a portion.

The mountain traveling of the last week has impressed upon many of the drivers the value of a four-speed gear-set for mountain use. Americans have often ridiculed the four-speed gear-set on foreign cars, claiming it was quite unnecessary, but continued days of mountain work show how valuable the fourth speed is. It is useless to punish a motor by having to use a poor gear ratio. It is better policy to have a greater variety, easily obtained in selective gear-sets. D. B.

HOW BOSTON ENTERTAINED THE DUST-GRIMED CAVALCADE

BOSTON, July 18.—In mapping out its program for the entertainment of its road-weary and dust-choked guests, the Bay State Automobile Club decided upon a very welcome shift from land to water, and headed the caravan on a special trolley to the boat for Nantasket Beach. A refreshing hour's sail down the bay past the harbor's many islands landed the tourists at Boston's Coney Island. There the party split. Some sought Paragon Park and its varied Dreamland-Luna Park frivolities. Others hustled for the bath houses and soon had all the refreshment they desired in water ten degrees below normal.

Toward 5 o'clock, the hour set for the big clambake, the scattered frolickers began to round up at Paragon Park's Palm Garden. They were a ready and hungry bunch that sat down to the number of 210 at 7 long tables with appetites whetted for the toothsome shore dinner that awaited them. The Mayor of Boston and the high muck-a-mucks of the tour and club were at the speakers' table and a score of ladies with their escorts were at another. Three tables were conspicuously unfilled, but the wait for their occupants was not long. To a lively quickstep by the band a hundred roisterers marched, lock step, to their places at the tables, amid great cheering. On the head of each was a diminutive merry widow hat. This started the fun going, which continued fast and furious throughout the feast. The band played and a soloist sang popular airs, but the song hit of the dinner was parody choruses, written by W. W. Caldwell, which were sung with enthusiasm whenever the band gave the cue. Throughout the dinner there was that spontaneous jollity which left no doubt that all hands were heartily enjoying themselves with the generous hospitality supplied by their hosts.

The clambake menu led off with steamed soft clams. Some of the inland motorists did not know that fingers were made before forks, but they soon learned and were as busy as any of the veteran shore diners. Then followed fish chowder, live broiled lobster, broiled spring chicken, chiffonade salads, ice cream, and all the "fixin's" that go with them. All were served piping hot by pretty white garbed waitresses, who with true Boston courtesy carefully looked after the requirements of the guests.

A hurrah of speech making wound up the dinner. They were all brief and to the point, took well, and were received uproariously. President Elliot C. Lee welcomed the tourists, and then gave way to Secretary Fortescue, who acted as toastmaster. Mayor Hibbard, of Boston, received an ovation. Chairman Hower, Vice-President Lewis R. Speare, and Charles J. Glidden followed. Even Mrs. Cuneo briefly replied to the cheers for her, wittily remarking that a woman always had the last word. There were loud cries for "Sunny Jim," to which rosy, rubicund Dai Lewis finally responded. A newspaper man handed out Boston and the club a jolly that met with a sincere echo, and then Chairman J. F. Hovestadt, of the entertainment committee, brought the speechmaking to an end.

After the bake the caravan scattered among the shows and wound up a most delightful day on the beach with a hurrah twice on the last boat back to town.

The Bay State Automobile Club's entertainment committee was made up of J. F. Hovestadt, chairman; Lewis R. Speare, C. R. Pierce, J. S. Hathaway, W. K. Farrington, G. W. McNear, Elliot C. Lee, H. W. Whipple, H. W Knights, J Fortescue, A. P. Underhill, and J. C. Kerrison.

Leading Contenders for the Hower Trophy in the Fifth Annual A. A. A. Tour.

SCENIC BEAUTY ON NINTH DAY'S RUN IN THREE STATES

POLAND SPRINGS, ME., July 20.—All hands vote to-night's stop the most beautiful from a scenic standpoint of the tour to date. The Summit Hill Springs House is a comfortable, well-kept hostelry, built on top of a little mountain in the center of a broad valley. From the verandas one has spread out before him in all directions a glorious panorama of green fields, picturesque lakes, and thick woods bounded in the distance by mountains, and to the west by high peaks. The Westerners say it reminds them of Colorado toned down to peaceful greens and gentle outlines.

The Canada tour presented the novelty of foreign surroundings, but it did not compare with the present one for daily variety. Each day brings with it an almost complete change of environment. The journey of 154 miles began with a run across the Cambridge Bridge and then circled the Harvard University campus and buildings. The caravan then headed for the shore, passing through Revere, Lynn, and Swampscott. Next came Salem, the witch town, with its interesting old house and homes.

Just beyond Salisbury, the caravan entered New Hampshire, skirting the ocean at Hampton and Little Boar's Head. While rounding a point of the latter, several cars were halted by Captain William H. Jacques, a retired navy officer and engineer of repute, who insisted on offering the passengers the hospitable greeting of cigars and whiskey. The captain showed the Packard press car party through his beautiful colonial home with its collection of rare old family furniture.

Portsmouth, a quaint old whaling town, where peace between Japan and Russia was arranged, was also interesting for its old houses and other reminders of past glories as a seaport, though it is still of importance through its U. S. Navy yard.

Crossing the bridge at Portsmouth, Maine was entered. As the tourists advanced, the scenery took on a bit wilder aspect. From Portsmouth the route turned inland and climbed gradually over rolling grades until a final steep climb brought the caravan to its destination.

The schedule of 8 hours set for the run of 154 miles did not bother the cars at all, most of them beating it by nearly an hour. Another day passed without any penalization of the perfect score division. It looks more than ever like a bunch of Glidden and Hower ties at Saratoga with 4 clean slate teams in the former and 5 runabouts in the latter after 9 days of touring.

The tourists found fine macadam in Massachusetts, excellent gravel highways in New Hampshire, and clay loam roads in Maine, which are quite a come down. J. C. W.

ON THE NINTH DAY—FROM BOSTON TO POLAND SPRINGS

POLAND SPRINGS, ME., July 20.—With nine of the twelve running days of the tour over, four teams are still in the perfect score classification; as are five of the original fourteen Hower contestants and the two Glidden certificate cars. Not a single one of the contesting machines lost a point in the 154-mile run to-day from Boston to this summer resort in the foothills of the White mountains. Thanks to the good condition of the clay roads from Portland to this point, and to the 19.2 mile per hour schedule for the biggest car class and the 17.6 mile schedule for the smallest class, none of the cars had the slightest troubles during the day.

Not a little consternation pervades the broad corridors and spacious smoking and dining-rooms of Summit Hotel to-night over the possibility of a big run-off after the arrival at Saratoga, Thursday evening. With but three days running, and the road assurances as favorable as those of to-day, it is certain that at least three, and perhaps four of the Glidden teams, will be able to have the 1,000 points blazoned on their banners on arrival at Saratoga; there is no reason why an equal honor does not await the two Pierces, two Stoddard-Daytons, and one Premier in the Hower end of the duel; and it is equally certain that the two Stevens-Duryea machines will continue the reliable record that they have maintained since the departure from the starting point at Buffalo.

Altogether it looks to-night as if motoring in America is to receive the biggest boom of the decade, which it rightly merits, if four out of ten teams can land at Saratoga with perfect scores, and if, as at present, twenty-three of the original thirty Glidden aspirants, can reach the goal without a single black mark being debited to them.

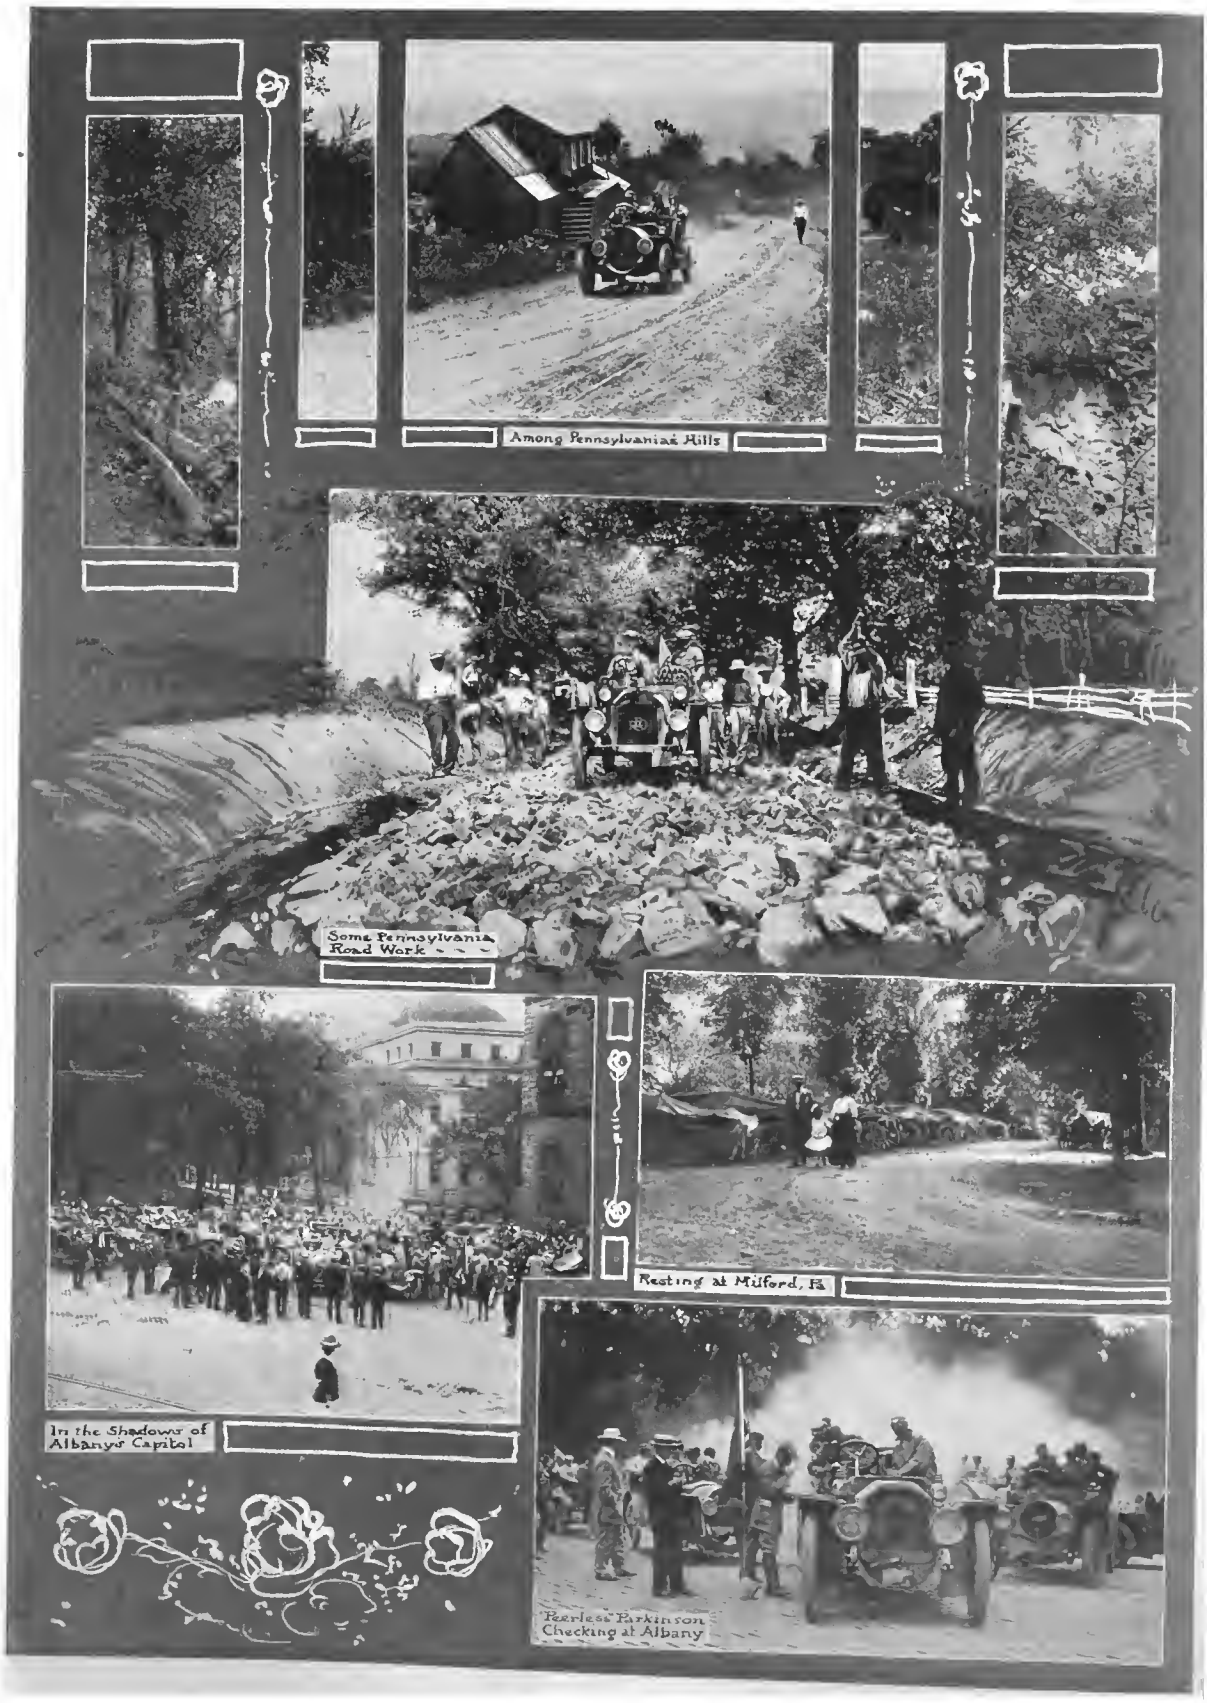
To-day was not without its incidents. M. S. Bates, driver of No. 14 Franklin touring car, narrowly escaped what might have proven a serious, if not fatal accident. Bates took or attempted to take a turn near Ipswich, 38 miles out of Boston, too fast.

A few apprehensions were floating around the corridors late in the afternon in the Premier ranks when Driver Preston with his one hundred century press car failed to report in with the other cars. All apprehensions were happily dissipated when later it was learned the car did not check out of Boston until 9 o'clock, and that when on the road it was playing a racing game with the Rapid truck, which carries No. 40 as its official cognomen. The Premier party ate dinner at Rye Beach, in sight and within hearing of the Atlantic billows, and enjoyed a real tour. Driver Preston, who, in the tourist phrase, has been beating it a little during the tour, to-day settled down to that phlegmatic pace which a car embarked on a century a day for a hundred days should pursue.

The Rapid truck, which has been daily covering the required schedule with its load of air bottles for inflating tires, has been receiving plaudits all along the line. To-day it got stranded by running out of gasoline and only the timely arrival of veteran Tom Fetch in his Packard press car saved it from a long wait by the roadside. Fetch did the good Samaritan act and brought the needed fuel.

The chairman's car was overtaken by the McGuire Pierce soon after leaving Portsmouth, 75 miles out of Boston, and close on the trail were Arthur Kumpf in No. 2 Pierce, Williams in No. 100 Pierce, Stevens-Duryea, Marmon, Mrs. Cuneo's Rainier, Thomas, No. 12 Franklin, and No. 10 Gaeth. These formed the advanced guard of the motoring caravan that started from Boston this morning, and after traversing New Hampshire, crossed a portion of Maine to this point.

Stevens-Duryea Contenders for Perfect Score Certificates.



TENTH DAY IN PINE TREE STATE—POLAND TO RANGELEY

RANGELEY, ME., July 22.—At the end of to-day's 141.7 miles run, through sand at the start and on mountains toward the finish, the number of perfect scores teams had been reduced from four to three, Marmon No. 22, driven by W. Clark, being penalized 8 points for being 8 minutes behind the 7 hour 20 minutes schedule for the route. There had been trouble with a brake which was, rather unwisely, temporarily instead of permanently adjusted and later required the removal of a wheel to remedy. Oakland No. 28 had 42 points added to its previous 7 points of penalization through tardiness, owing to the breaking of the front spring.

In the Marmon matter, H. H. Rice, who rode with Clark, put in a protest, claiming that the racemaking car did not maintain the time schedule throughout and that the Marmon was thus held back. The protest was not allowed.

With two days more to go, 22 contesting cars remain with perfect scores. The tour is the most convincing demonstration of the reliability of American cars that has yet been given, and all the more remarkable when the course and conditions of the test are considered.

The first dozen miles out of Poland the going was sandy and soft, but it improved when Lewiston was reached, and the beautiful fifty-mile run begun along the Kennebec river, through Augusta to Waterville, through which the 1906 tour passed en route to Rangeley. The caravan packed down the clay into broad ruts—which made the going quite smooth for the pursuers of the leaders. Shortly after leaving Madrid the upgrade climb began, and the country grew wilder. Picturesque lanes were passed, and there were splendid prospects of valleys and distant mountains from the hilltops looking back. Much of the going was through damp, cool woods until the Rangeley Lake House was reached. The cars were parked this time at the entrance to the hotel grounds. The 300 tourists put not only the hotels but the town's sleeping capacity to the test. Although the house was packed four to a room, fully one-third had to be roomed out in the village. J. C. W.

BAY STATE TEAM DROPS FROM THE PERFECT SCORE LIST

RANGELEY, ME., July 22.—No. 22 Marmon, driven by W. Clark, was penalized 8 points to-day, caused by a brake seizing when near Madrid, 18 miles from the night stop, the delay caused by the adjustment of the brake making the car ten minutes late in checking in. This car checked out at 7:50 this morning, 50 minutes after Chairman Hower's pacemaker left Poland. In spite of this lead, the Marmon, in company with several others, overtook the pacemaker at 77 miles and trailed him until the Marmon experienced its breakdown, when the car had 1 hour 25 minutes in which to finish the remaining 18 miles and repair the brake. The contention is made by the Marmon people, and is embodied in a protest to Chairman Hower, that it lost 15 minutes of its schedule trailing the pacemaker car from the 77-mile point, and because of this the entrant contends that the penalty should not be imposed.

The penalization of this car drops the Marmon team, entered under the colors of the Bay State Automobile Club, from the perfect score category, and leaves but three teams clean, namely: Pierce, Peerless, and combination Haynes and Oldsmobile.

One other car suffered penalty to-day. No. 28 Oakland, entered in team No. 2, Chicago Motor Club, lost 42 points, due to the breaking of a left spring when within four miles of Rangeley. The car was traveling fast and struck a treacherous road surface, with a covering of water and having a few deep ruts. The result was a complete break of the spring, which was repaired with fence rails and other procurables. The car checked in 44 minutes late. This car lost 7 points on the second day of the run, and now has a total debit of 49 points, which puts 16.3 debits against the club, cutting its credit to 983.6 marks.

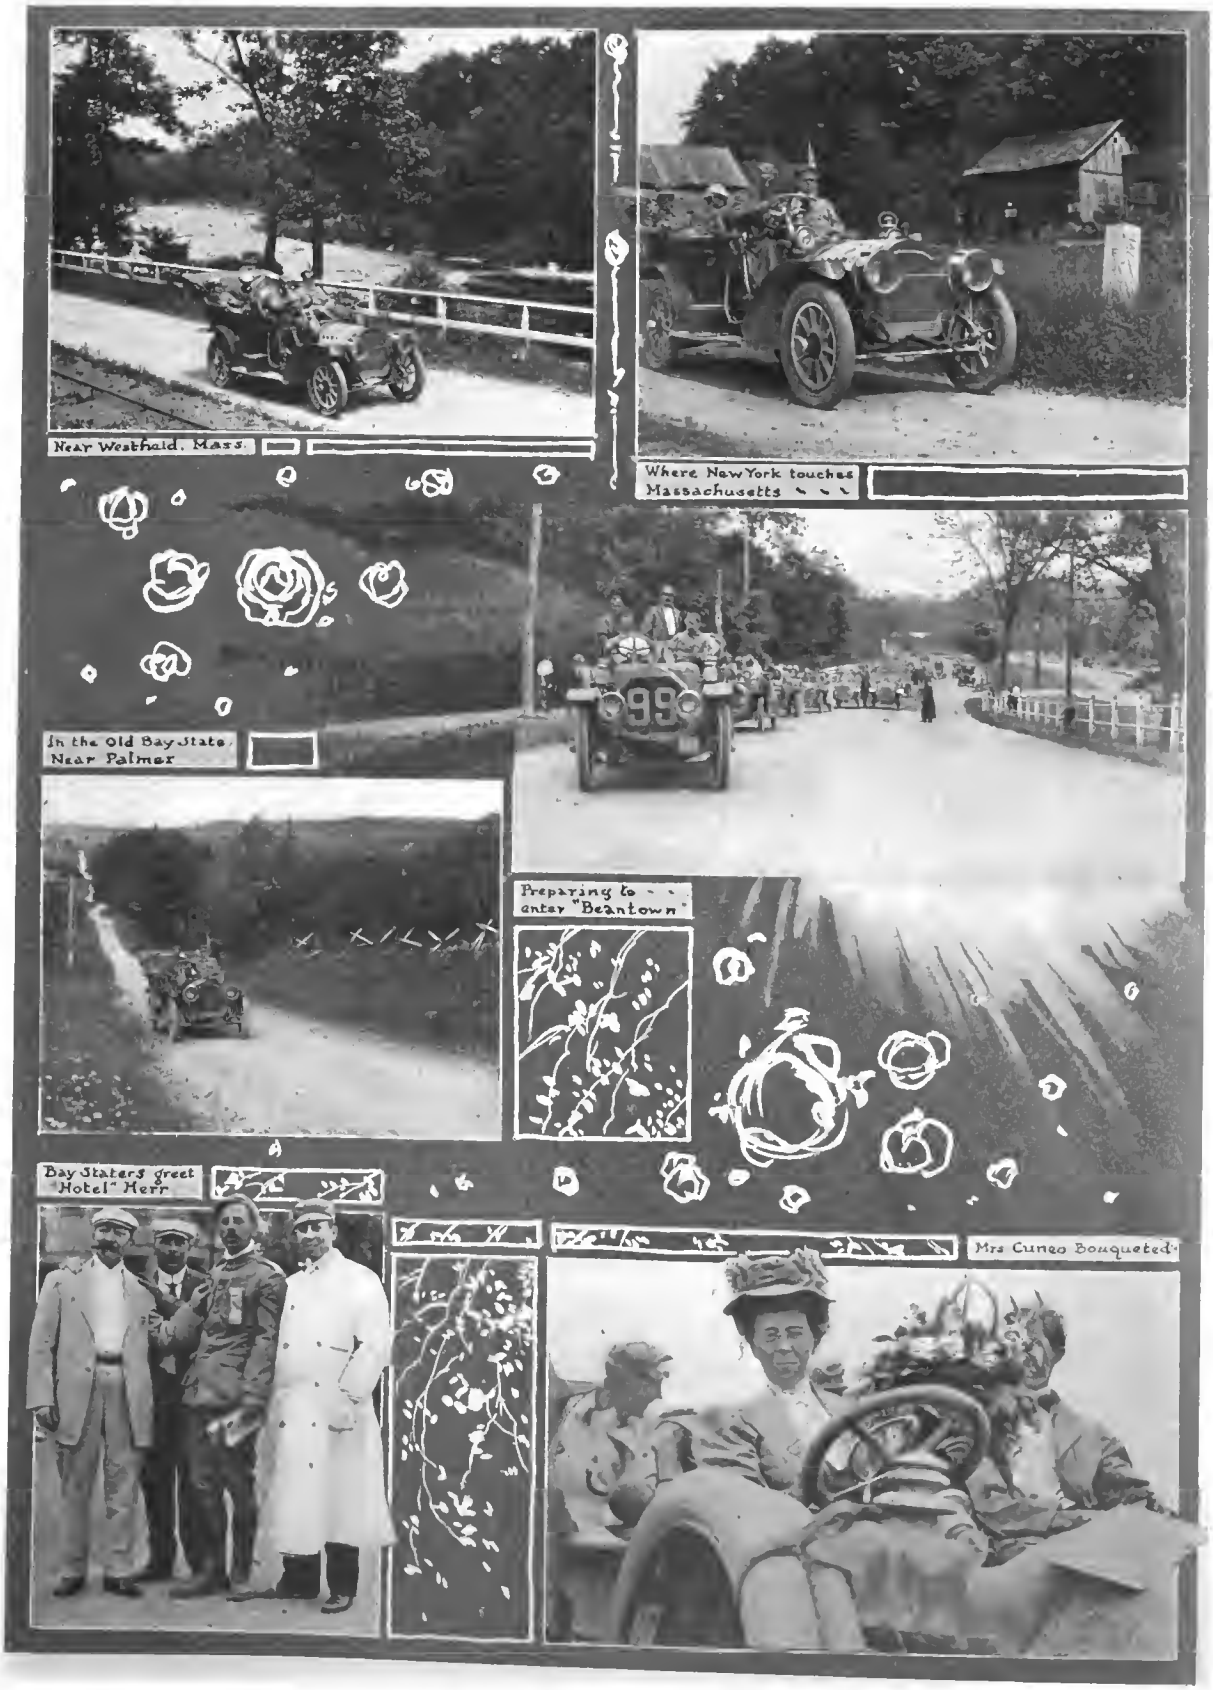
William Hurtburt, driving Garford No. 31, did some fast running during the first two hours out of Poland, covering 73 miles in this time. Later he had ignition troubles, but checked in to-night well ahead of time.

To-day's schedule of 141 miles in 7 hours 20 minutes gave an average of 19.1 miles per hour for the big cars and 18 miles per hour for the smallest Glidden contestant. The schedule was a very easy one. Complaints, however, are heard that the pacemaker set too fast a pace to-day through a few of the towns toward the end of the run and that while in the country districts he hit a very slow pace. It is natural to want to quicken over the good villa and town and city streets, because they are all cleared for action and waiting for the arrival of the Glidenites, but it is bad policy. The last half of to-day's run was a spectacular procession through the tortuous roads of the mountains. A dozen cars were in parade, separated from one another by but a few lengths. In this order they rollicked over the undulations of the narrow mountain roads and made a sight that brought cheers from the few spectators who sought the sides of the hills to watch the cars go by.

It is rumored here to-night that Chairman Hower may start to-morrow but 15 minutes before the first car to check out, the aim being to prevent the cars having an hour or more after their arrival at the night checking point in which to overhaul the machine and get it in the best of condition for the run of the following day. The rules governing the tour permit him to start at any time previous to the checking out time of the first car, and it is certain that should he desire he can check out but one minute ahead of the first car out and check in but one minute in advance of it. A pacemaking schedule of this nature would eliminate all possibility of making up time lost on the road for repairs other than tires and might result in the elimination of one or more of the three perfect score teams as well as of the 29 perfect score cars in the total contest.

Many are the complaints against this scheme, but there is no reason why it can't be done; in fact, it is allowed by rules. It is more and more being imprinted upon the officials that in a future Glidden tour penalties should be imposed for work done on a car. At present it is possible to break a frame and repair it and finish perfectly, and it is possible to break any part that a duplicate can be made by the driver and mechanic and yet finish without penalty. This is not fair. Consider cars A and B. Car A breaks spring leaf, crosspiece of the frame, two frame truss rods, and other parts. Car B has not a single break. Obviously B is the better car, but according to the present rules car A gets as clean a standing as car B does. This should not be.

The facts are definite to-day of the cause of Stoddard-Dayton No. 109 catching fire around the carbureter on the Pittsburg-Bedford run. It appears that this car has pressure feed for the gasoline and that in the gasoline tank is a standpipe rising from the base to within a short distance of the top. The pipe conducts the exhaust pressure to about the surface of the gasoline, so that it was vaporizing too readily in the carbureter, and when an explosion occurred in the carbureter it ignited the gasoline fumes around the motor. It was not short circuiting of the magneto that caused the fire. An order from the factory was received that this car be withdrawn, leaving only the two perfect score Stoddard-Daytons in the Hower struggle. D. B.



GOSSIP OF BIG TOUR AND THOSE PARTICIPATING THEREIN

A. A. A. Tourists May Hike West Next Year.—As is usually the case, the tour is hardly under way before the "rumor conunittee" begins to speculate and surmise as to where next year's tour will be. At times some unseen power constitutes this "bunch of loose talkers" a committee of the whole, so prevalent do the predictions about what is going to happen next year become. Gossip has it that in 1909, it will be Chicago's turn to act as the starting point, and for a time at least the roads east of the Mississippi will be abandoned, Denver being the goal of the 1909 Gliddenites. No one of the proposed routes that have ever been given creation in the seething gray matter of some of these before-handed thinkers, has served to arouse quite as much interest as this talk about getting into new country next year. Come to think of it, why not? The A. A. A. Reliability Tour is an American institution and there is nothing sectional in its character, and now that repeated transcontinental tours and political convention jogs have shown the feasibility of the project, there seems to be no good reason why the West should longer be neglected. The talk current about the project has even advanced to the stage of outlining the plans in detail. There will be no hustling for accommodations and no one can insist on having "one with a bath," for the caravan will travel circus style and erect its own tents at each night stop. There will likewise be the "grub wagon" and the other concomitants of a well-regulated commissary department. Evidently some one has been thinking hard on the subject. Whether the thoughts of the powers that be are along totally different lines, and the plan of giving the West a show is only a little of the superfluous rarified atmosphere of which there is always such a copious supply, remains to be seen.

Some Statistics of the Tour.—The following are a few of the statistics relative to the features of the forty-six cars contesting in the Glidden, Hower and Glidden certificate ranks:

Chain drive, 3; shaft drive, 43.
Four-cylinder, 32; six-cylinder, 9; two-cylinder, 5.
Water-cooled, 42; air-cooled, 4.
Friction transmission, 2; planetary transmission, 7.
Progressive sliding, 12; selective sliding, 25.
Jump spark ignition, 35; make-and-break ignition, 11.
Opposed motors, 3; vertical motors, 43.

The three Marmon cars competing are all of 1909 vintage, and carry four-cylinder motors, with 5 3-8 by 5 inch cylinders, the rating given out being 50 horsepower. The new rear axle made by the company is one of their features. It has the differential housing fitted with a circular plate at the rear through which the differential gears complete can be removed. The brakes are internal bronze, shoes faced with a fabric cover which are located side by side and expand within a 17-inch cast-steel drum 4 inches in width, so that each expanding shoe has a width of almost two inches. The adjustment of each set is by a screw which acts within a worm sector carried on the shaft that has the expanding cam on it. The double three-point suspension is retained, but modified in that the motor and gear-set are carried on a cradle, which at its front rests on the front springs and at its rear is trunnioned on a dropped crosspiece of the frame which carries the car body.

Around Historic Boston and Vicinity.—Packard Seventeen was a phrase coined during Sunday while a party of fourteen press representatives, at the request of E. Ralph Estep, publicity manager of the Packard company, was entertained in three Packard cars by being shown the points of historic interest around the Hub on a 100-mile jaunt. With Russel Huff, Tom Fetch, and Fred C. Graves of the Boston Packard agency as wheelmen, the run through Boston and suburbs was made. Crossing into Cambridge a glimpse of Harvard University was obtained; the route continued to Concord, where still stand the Emerson and Longfellow homes, and beyond were visited the battlegrounds where was lighted the match that culminated in the great Revolution. Every mile or so along the road are to be found tablets or monuments marking incidents in the war for independence; by the roadside stand houses erected previous to 1775 and in which figured episodes that are now links in the great chain of Revolution events; and in every town are monuments and parks consecrated to the memory of those who fought and died. From Concord the route led to Lexington. Circling at a ten mile radius west of Boston, the course embraced Salem, with its "House of Seven Gables"; Marblehead, with its old fortifications; Lynn, the home of the shoe industry; and Chelsea, that so recently was nearly entirely destroyed by fire. A stop was made at Bunker Hill monument.

Selden's Record Run to Bedford Springs.—Through the breaking of a front spring on the Selden entrant in the A. A. A. tour, competing under the colors of the Rochester Automobile Club, a record run was made over the 450 miles intervening between Rochester and Bedford Springs. The driver's wire for a new part was received too late to make a shipment by express, so George B. Selden, Jr., decided to deliver the part in his own car. With Driver Fred Wilson at the wheel and Superintendent John Siegel beside him, while Mr. Selden and Head Tester Charles Young occupied the tonneau, the party left Rochester at 1:20 Sunday morning. Cambridge Springs was reached 11 A.M. Sunday, and, after a heavy shower that made slow going, the party rolled into Pittsburg at 5 P.M. Here the Pittsburg Automobile Club supplied maps and a guide, and Bedford Springs was reached at 6:30 the next morning, only to find that the new spring could not be used without disqualifying the car. Temporary repairs were made with the aid of four nuts, but as they come under the head of "finished material" the Selden entrant lost its standing after all, but continued for a certificate and will go through to Saratoga.

SONGS OF THE A. A. A. TOUR.

(Tune, "School Days.")

Tour days, tour days,
Tough old Glidden tour days,
Schedules arranged by arithmetic,
Up to the hubs in the mud we stick.
Seventeen hundred miles or so
Gosh, how we made the old car go,
And didn't we take a header though
When we had a couple of skids.

(Tune, "Merrily We Roll Along.")

Merrily we eat the dust,
Eat the dust, eat the dust,
Merrily we eat the dust
'Cause Hower says we must,
'Cause Hower says we must, 'cause Hower says we must.

(Tune, "Oh, Mr. Dooley!")

Oh, Mrs. Cuneo, Oh, Mrs. Cuneo,
The greatest woman driver that we know,
She keeps a going; she makes a showing,
Does Mrs. Cuney-uney-uney-O.

(Tune, "I'm Afraid To Go Home After Dark.")

Listen here, Hower dear,
I'm afraid to check in after dark.
Ev'ry day the papers say
That a car hit a tree in the park.
I'm on the tour of the dear A. A. A.,
Trying to set the spark,
Oh, I wish I were home,
For I'm afraid to check in after dark.

(Tune, "The Garden of Love.")

Won't someone kindly tell me,
Won't Hower answer why
To me this tour's the limit,
I'll soon "cash in" and die.
Nine hundred points against me,
And I should like to know
Why they make a lemon of a car on these roads,
Where only the goats should go.

NATIONAL TOURS OF THE A. A. A. WHICH HAVE PRECEDED

1904: The first annual tour of the American Automobile Association, starting July 25, 1904, had as its objective point St. Louis, where the Louisiana Purchase Exposition was being held. Sixteen machines started from New York and joined themselves to eleven others from various New England towns. The ranks of the travelers were swelled by additions from all points, continuing by way of Albany, Utica, Syracuse, Rochester, Buffalo, Erie, Cleveland, Toledo, South Bend, Chicago, Pontiac (Ill.), Springfield (Ill.), to St. Louis. At the same time another portion of the tour was being run over the National Highway and through Columbus, Indianapolis and Terre Haute to the Exposition City, bringing the total number of participants to 108. Practically all the machines reached St. Louis, the tour being more of the nature of a combined run than a competition.

1905: Thirty-two automobiles competed in the 870-mile Association tour in 1905, the first contest for the Charles J. Glidden touring trophy. Starting from New York, the itinerary was through Hartford, Boston and Plymouth, N. H., to Bretton Woods, and returning by way of Concord, Worcester and Lenox, Mass., to New York. Percy P. Pierce was awarded the trophy. Others finishing with clean scores were Ezra H. Fitch (White), Ralph Coburn (Maxwell), S. B. Stevens (Darracq), and J. C. Kerrison (Cadillac).

No official observers were carried, the contestants as a whole observing the performance of the competing cars, and at the end of the tour voting for the three entrants whose cars, in their opinion, had made the best records. In addition, the Glidden Commission employed a formula which took price, equipment and general touring conditions into consideration in awarding the trophy. First-class certificates were given to twenty-two contestants who completed the tour and arrived at all night controls before the official closing time. Four second-class certificates were awarded to others who completed the tour, but failed to make one or more of the controls in time.

1906: The third annual Association tour in 1906 and the second competition for the Glidden trophy, was a 1200-mile run from Buffalo to Bretton Woods, N. H., by way of Utica, Saratoga, Elizabethtown, Lake Champlain, Montreal, Quebec, Jackman and Rangeley, Me. Forty-eight machines started, 13 secured perfect scores, 19 completed the journey with a greater or less number of penalizations, and 20 retired at various points on the journey. Of the six cars competing for the Deming trophy two obtained perfect scores and four were penalized. The trophy was awarded to C. W. Kelsey, driving a Maxwell.

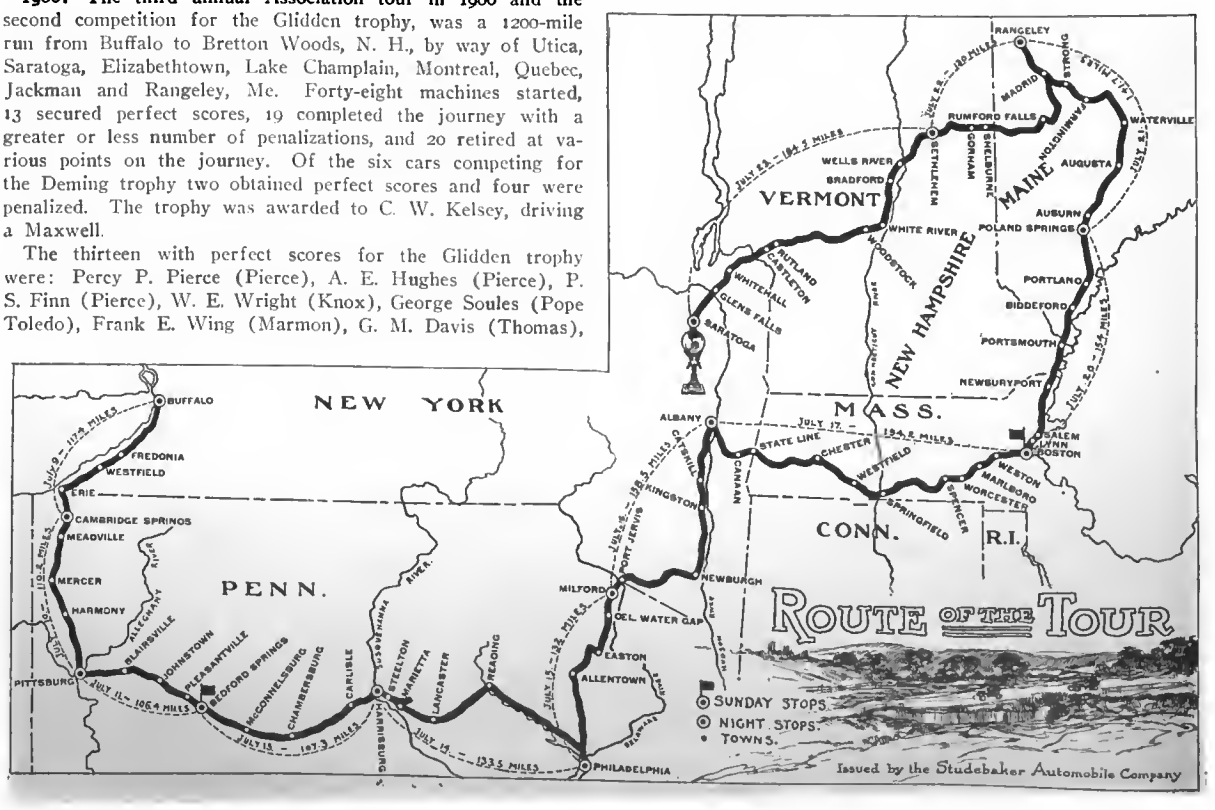
The thirteen with perfect scores for the Glidden trophy were: Percy P. Pierce (Pierce), A. E. Hughes (Pierce), P. S. Finn (Pierce), W. E. Wright (Knox), George Soules (Pope Toledo), Frank E. Wing (Marmon), G. M. Davis (Thomas), C. F. Barrett (Columbia), L. J. Petrie (Stearns), Charles Burnham (Peerless), W. C. Walker (Pope Hartford), Ernest Keeler (Oldsmobile), G. G. Buse (Packard). Since no winner had evolved and Percy Pierce was one of the perfect score performers, the trophy, according to the deed of gift, remained in the possession of the club which he represented.

1907: The route of the fourth annual A. A. A. tour was from Cleveland, O. (July 10), to Toledo, South Bend, Chicago, South Bend, Indianapolis, Columbus, Pittsburg, Bedford Springs, Baltimore, Philadelphia, New York (July 24). Distance, 1,570 miles. Forty-nine touring cars competed for the Glidden trophy, 12 runabouts entered for the Hower trophy contest, and 14 cars accompanied the tour on various services or as non-contestants. Both contests were run on a daily time schedule, with penalizations for replacements according to the catalogue value of the parts used. The Hower trophy was for individual car performance, the Glidden trophy for the best club showing, with certificates in addition for all cars finishing with a clean score. Clubs represented in New York, Cleveland, Chicago, Buffalo, Pittsburg, Detroit, A. C. A., and Westchester. The Buffalo team captured the Glidden trophy. Touring cars finishing with clean scores were Pierce (4), Thomas Flyer (2), White (2), Peerless (2), Packard, Haynes, Welch, Reo, Walter, Berliet, Royal, Tourist, Premier, American Mors.

A Stoddard-Dayton and a White steamer tied for the Hower trophy. On an additional test being imposed, the White proved the winner.

CHARLES H. DALE DIES SUDDENLY.

LARCHMONT N. Y., July 21.—Charles H. Dale, president of the Rubber Goods Manufacturing Company, and a director of the G & J, Morgan & Wright and Hartford Rubber Works Companies, succumbed suddenly to heart disease at his summer home here to-day. He was 56 and is survived by his mother and a widow and daughter.



GLIDDEN PLANS ORGANIZATION FOR AERIAL TRANSPORTATION

BOSTON, July 20.—Charles J. Glidden was in this city only a short time during the stop of the A. A. A. tour, one section of which is competing for a trophy donated by him, but he was here long enough to set things aeronautical going in a most vigorous way. Hardly had he left the city this morning with Chairman Hower than the announcement came out that at his request a leading firm of lawyers was drawing up incorporation papers for a concern to be known as the American Aerial Navigation Company to be created for the purpose of manufacturing and operating aerial devices and the establishing or aerial routes for the transportation of freight and passengers in the United States, Canada, and Mexico. The announcement says in part:

"Mr. Glidden anticipates that within the next eighteen months the new company will be carrying passengers and merchandise by the 'air-line' between New York and Boston—either by use of the dirigible balloon or aeroplane. He believes that with relay stations near Springfield and New Haven the trip can be made three hundred days in the year, the one from Boston to New York during daylight and from New York to Boston in seven or eight hours.

"The first experiments will be made with small dirigibles with a capacity of one or two passengers in addition to the operator. Stations will be established close to the street car lines on the outskirts of the cities, with suitable facilities to house the dirigibles and supply any loss of gas en route. An inexpensive plant to manufacture hydrogen gas will be in operation at each station. As the dirigibles will travel at an average height of 500 to 800 feet, very little loss of gas should take place. Pending the establishment of the air lines, and to familiarize people with aerial voyages, ascensions will be made from Pittsfield and North Adams in the spherical balloons. The parties interested in the new company hold options on a large manufacturing plant of aerial apparatus, and are in negotiation with parties for the manufacture of dirigibles.

"The form of dirigibles to be adopted will depend upon the success of the experiments now being carried on by the governments of the United States and France. 'Aerial travel,' says Mr. Glidden, 'will be, when thoroughly established, the cheapest and safest form of transportation.'"

It is significant in this connection that several years ago Mr. Glidden attempted to organize a balloon club in Boston long before any similar steps had been taken in other American cities.

POPE AFFAIRS BEING STRAIGHTENED OUT.

HARTFORD, CONN., July 20.—Application will be made to-morrow by George A. Yule and Albert L. Pope, receivers for the Pope Manufacturing Company, to Judge H. J. Curtis, sitting in the Superior Court, for the issuance of such orders as may be necessary for the continuance of the business for four months from August 28 next. They will also apply for an order for the transfer of certain assets from this State to New Jersey in order that another 25 per cent. dividend may be paid to the creditors. Vice-Chancellor Howell is credited with the statement that he thought the receivers would be able to pay off 75 per cent. of the approved claims within four months. This does not include the Unzicker claim, said to amount to $575,000, for the rental of certain factory premises in Chicago, and the status of which has not been definitely settled as yet.

The creditors' committee is circulating a letter calling attention to the petition to be presented by the receivers to Vice-Chancellor Howell at Newark, N. J., asking for instructions as to the continuance of the business. It is said that counsel for the stockholders has urged that $800,000 of the creditors' money be employed to continue the business for one year, contending that this could be done at a profit. This is strenuously opposed by the creditors' committee, on the ground that there is already in excess of $1,000,000 in hand, and that, whether it was conducted at a profit or not, the benefit would accrue to the stockholders, and not to the creditors. The latter are being advised not to sell their claims, as they will shortly be paid in full, with 6 per cent. interest.

BRITAIN'S FOUR-INCH RACE WELL ENTERED.

LONDON, July 18.—Britain's limited bore race, popularly known as the Four-inch race, will unite at least 35 competitors on the Isle of Man course Thursday, September 24. Continental Europe is represented by 14 cars and the home country by 21. As this is the first occasion on which England has held a pure speed event on the road since the Gordon Bennett race in Ireland, it is being watched with considerable interest, and is certain to unite a large gathering in Manxland during the last weeks of September. The list of cars engaged is as follows: Rover, 2; Hutton, 3; Arrol-Johnston, 3; Hillman-Coatelen, 2; S. C. A. T., 1; Vulcan, 1; Coventry-Humber, 1; Beeston-Humber, 2; Thorneycroft, 3; Calthorpe, 2; Deasey, 2; De Dion Bouton, 1; Darrac, 3; Metallurgique, 3; Berliet, 2; Vinot, 2; Westinghouse, 2.

STANDARD OIL WANTS ITS OIL USED.

INDIANAPOLIS, IND., July 21.—It is reported that the Standard Oil Company has decided it will control the oiling of roads and city streets in Indiana or that it must stop all together. In other words the company is alleged to have sent forth the word that unless Standard oil is used none will be used at all.

At Muncie, where extensive experiments have been made in street oiling this year, indications are that oiling will have to be stopped. So far oil has been purchased in the Muncie oil field at 99 cents a barrel, whereas the Standard Oil Company is demanding that its oil be used, which would have to be shipped to Muncie at $1.59 per barrel, f. o. b. cars in Kentucky.

Producers in the Muncie field say the Standard Oil Company has issued an ultimatum that it will no longer accept their product if they continue to sell to the retail trade, and incidentally to the men who have the oil sprinkling contract in Muncie.

WITHDRAWAL OF SANCTION CLEARS MATTERS.

PHILADELPHIA, July 20.—What promised to be somewhat of a racing muddle in Quaker city automobiling circles, has been averted by the prompt revocation of the sanction granted the Norristown Automobile Club for a meet to be held at the Point Breeze track next Saturday. The sanction was granted without the consent of Charles J. Swain, local representative of the American Automobile Association, and an ex-president of the Quaker City Motor Club, and has since been revoked on the ground that the Norristown club was attempting to go out of its territory to hold a meet. It is understood that the Quaker City club will hold another meet in August and a fall event in September, owing to the success which attended the last races at Point Breeze.

OHIOANS WANT TO USE AUTO TAX ON ROAD.

TOLEDO, OHIO, July 20.—A well concerted effort, at present headed by Col. Webb C. Hayes, is being made to utilize the income from the State automobile tax law in the erection and maintenance of an automobile road from Columbus to Lake Erie over the oldtime trail taken by General Harrison in 1815 during his memorable march during the second war with England.

The proposition is now in its early formation and if it meets with the approval of automobile clubs in the State and other automobilists, the State legislature will be importuned to use the income in this direction.

HOW 'TIS DONE IN PARIS.

By GEORGES DUPUY.

MY friend Norbert, who dines at the Avenue de la Grande Armée restaurant, is a dealer in second-hand automobiles. (I call him a dealer in automobile curiosities.)

Sad to say, that second-hand business of asthmatic motors, repainted bodies, and plastered tires, has gone to nothing on account of the quick manufacturing and reasonable prices of nowadays. The big "constructeurs" have driven the "nightingale agents" away from the Porte Maillot. But the cute, the clever ones still remain around and make a pretty decent living out of the combinations. My friend Norbert is one of those.

He was ordering the menu, and I had just unfolded my serviette, in front of him, the other day, at that Grande Armée place, where they all come, when a young messenger of the Postes et Télégraphes, his cap in his dirty little hands, remitted to him a telegram with five telegraphic orders for five thousand francs each. Norbert signed the blue slip with a gold-mounted fountain pen, gave a forty-sou piece to the little chap, and said to me, with that dreaming air of his, while reading aloud the message: "What do you say?—er—er. Tool box well received —two more 920-120—er—Madame delighted—Very well! What? —Oh!—that's a customer from Vichy, at whom I bombarded a 40-horsepower Liérich. A bird, I tell you! The blessed thing cost me an awful lot, garage, gasoline and all, since Easter. Now, mon cher, how about some of that 'navarin bourgeoise,' with a bottle of Chablis?"

The coffee was served, hot and a little foaming in the cups, when a long and slender young man, with an incredibly high collar which reminded of the Chinese stocks, extended to my friend, over the table, a military white-gloved hand and pronounced, with an angelic smile:

"'My dear Mr. Norbert, tell me, if you please; I have an offer for a 20-30 Bernault 1906, long chassis, landaulet by Schwalbacher, not used for five hundred kilometers. What do you think it is worth?"

"Don't know," said Norbert, gulping down his demi-tasse while talking. "It depends. At all events I can't positively consider anything just at present. I'm stuffed with a thousand bargains like yours. But I will let you have the American, if you want. How about fifteen louis?"

"Why, yes, that will do, my dear Mr. Norbert," replied the long, slim gentleman. "Send him along to-morrow morning at half-past nine."

"Are you going to tell me," said I, amused, "who on earth is that 'American' whom you 'let people have' for 300 francs?"

"My good man," said Norbert, with a comical emphasis, "first of all things, don't get excited. This world is great—and you have traveled little. The honorable gentleman in question—but here he comes! Look pleasant now. Hello, Frank!"

The man thus called approached. He was a handsome looking young fellow of about thirty; very "American" indeed in appearance and evidently clothed by the smartest tailer of Fifth avenue. Norbert introduced us.

"Mr. Frank McDermith, of Pittsburg: Monsieur Georges Durand, one of my good friends."

The American shook my hand cordially, and, bending his tall body over my shoulder, yet keeping the correct and rigid attitude of the well-educated men of the New World, he began muttering to Norbert, in the lowest, the commonest Parisian slang, a discourse, hardly translatable in any language.

"How is your sweet self, sir? Yes, sir ! We've got it. We've got the big brute for six 'notes.' I think it's pretty poor. What d'ye say? Twenty-five louis for my sweet self! Don't ask me if Julot, the old hoss, he was tickled to death when we took it away from him! Gee! A duck nobody wanted. She plays an awful tune of drum when you crank her, she kicks like a mule and consumes twenty liters of gasoline by the hour. Never mind! The crazy fool who handed the dough is happy."

"That's good," said Norbert, visibly indifferent to the abundant talking of the queer individual. "Now don't forget that you have an appointment with the viscount to-morrow morning at nine-thirty. I proposed fifteen louis."

"Right you are! I'll be there. See you to-morrow."

"Now come on!" said I to Norbert, laughing with him. "That fellow is certainly the greatest number I have seen for some time! And the beauty of it is that he is just as much of an American as Adolphe, the head waiter, might be!"

"How clever!" replied Norbert, ironically. "They can't keep anything from you! In fact, the gentleman's name is Désiré Desclevin. He is the son of Pierre Desclevin, an old joiner of the rue de Charonne, where my friend himself got born, some twenty-eight years ago. In our business the difficulty is not 'the sale.' A good man, who knows how to smell the wind, always sells easy enough. The main thing is to buy.

"For instance, the day before yesterday, I heard that the manager of 'Paris-Moteur' garage, a new establishment, had just received for sale, a big 50-horsepower landaulet de voyage Bannard 1907, about new, all accessories, and three rear Rouge ferré Continentals packed on the top. The proprietor of the car, obliged to leave immediately for Brazil, wanted 15,000 francs for it, a price already interesting to me, as I had a customer willing to pay 16,000 for the very same type, second-hand. But I wanted to get the limousine for 12,500. You understand? The intermediary would hear nothing of the kind, saying that he had received formal orders not to cut a sou on the bargain.

"I, however, made him sign an agreement by which he would allow me, his colleague, a commission of 500 francs if I'd bring him a buyer with the cash. You get that clear, don't you? Then, here is where my false American appears on the stage.

"I had, the night before, telephoned to the manager of 'Paris-Moteur' that I had found a customer, a rich foreigner, and that the gentleman and I would be at his garage the next day at 10 o'clock. Right after that first telephone message I sent for Désiré Desclevin, whom I hire all year long on an exclusive contract, told him in a few words of what was the matter and filled his beautiful morocco pocketbook with thirteen brand new thousand-franc bills, just drawn from the bank.

"I was at the garage on the minute. He, Désiré, arrived a good quarter of an hour late, in a taxicab, swell as the swellest New York clubman; clean shaved, brown hat, brown suit, low patent leather shoes, mauve silk tie and stockings. The manager, hat down, met him at the gate and led him to the big car, which they had washed and cleaned and polished all morning. Playing my part, I had already opened the door of the limousine to show 'Mr. McDermith' the inside equipment, but, without condescending to look at me, Desclevin said in a peremptory tone, and with the most perfect English accent:

"'Mer-ci, Messieus. I shall see for myself. I am not a beginner in the automobile. Will you please crank the motor?'

"He turned twice around the car, looked underneath, lifted the bonnet, stopped the engine by cutting off the current, like an old chauffeur, and rudely addressing the owner of the car—a young and dull-skinned hidalgo who was witnessing the scene with a supremely indifferent air, Desclevin said: 'Tell me the truth. You have traveled with this motor car over ten thousand miles?"

"The other swore by his ancestors that such were not the facts; but Désiré, without according him a glance, took out of his pocket and laid on the varnished mud guard of the limousine his thirteen thousand franc bills, saying with his same accent:

"'Voua-ci. Treize mill frones. You take that money or I will sign a check on the American Express, if you like it better. That is all what it is worth, Messieu. No—no use—inoutile! Don't make any gests nor raise your shoulders, or I shall see myself obliged to pocket my money again. This automobile he is the eighth I buy in my life, you know. This one he is for my mother, in the South. You know what my mother she pay in America, for one 40-horsepower like that? Bien! my mother she pay only twelve mill frones for one quite new.'

"Of course the blue notes of the Bank of France produced their irresistible effect, and my commission duly pocketed, I took out *for 12,500 francs*, the automobile sold to my customer, Mr. Frank C. W. McDermith, of Pittsburg, Pa., U. S. A."

FUTURE OF GRAND PRIX SEEMS TO BE IN DOUBT

PARIS, July 20.—In killing the Gordon Bennett and substituting therefore the French-cooked affair since known as the "Grand Prix de France" the French trade and the Automobile Club of France, which are closely intertwined in racing, bravely determined to grasp the bull by the horns and to dictate that all international racing held in France thenceforth should be *à la Française*. The French flavor was made so strong that nothing foreign was to be permitted to crop out. *Hélas*, it is next time to grasp the bull by the tail, for then it will not be so hard to let go when the animal stands for Italian or Teutonic superiority. France and Frenchman generally have been bitterly disappointed in the outcome of the carefully planned Grand Prix. Instead of being a mild and tractable animal that could be kept under the tricolor without difficulty, this creature permits itself to be robbed of all its honors by France's dearest enemies and becomes transformed into a white elephant, that she would like to kill but can't.

The outcome that was so generally predicted, once it became known that France had been utterly swamped on the Dieppe circuit, has already come to pass, for at the meeting of the Commission Sportive, held here to'day, a proposal to abandon the Grand Prix was broached by the Marquis de Dion and was supported by a number of his friends, but the preponderance of sentiment was against it, for defeat still rankles too strongly. Had it been any other nation but Germany, such a thing might have been possible on the ground of chance or accident, but there can be no sidestepping the avalanche under which the tricolor disappeared on July 7. The cry of "Let me out and I won't do it again," that comes from beneath the heap, is indicative of a renewal of the same sentiment that was responsible for the killing of the Gordon Bennett, except that now no choice remains but to attempt to retrieve the honors lost, or ignominiously retire. The "I don't want to play any more" faction has already come to the surface in to-day's meeting, and it is probable that if it had not been so strongly opposed, the obsequies over the Grand Prix would have already been a matter of history. The feeler thus advanced attracted too much attention to itself, however, and after an informal discussion, the project was tabled until the September meeting.

Growth of Prolonged Speed.

An interesting table is herewith given, showing the growth of prolonged speed for the last eight years in all the principal international events held in Europe and America:

Year.	Driver.	H.P.	Course.	Distance.	Average. Time. (Miles.)
		Gordon Bennett Race.			
1900	Charon	20	Paris-Lyons	310	9:09:00 37.5
1901	Giradot	40	Paris-Bordeaux.	344	8:51:50 36.9
1902	S. F. Edge	40	Paris-Innsbruck.	366	10:41:58 34.1
1903	Jenatzy	60	Ireland	367	6:39:00 55.5
1904	Thery	75	Taunus, Germany	347	5:50:08 59.6
1905	Thery	90	Auvergne	310	7:02:42 48.6
		Florio Cup.			
1905	Raggio	120	Brescia	312	4:46:47 65.2
		Ardennes Circuit.			
1905	Hemery	90	Ardennes	372	5.58:32 61.82
1906	Duray	130	Ardennes	372	5:38:39 63.36
		Vanderbilt Cup.			
1904	Heath	90	Long Island	284.4	5:26:45 52.2
1905	Hemery	90	Long Island	283	4:36:08 61.49
1906	Wagner	120	Long Island	283	4:50:10 61.43
		Grand Prix.			
1906	Szisz	100	Sarthe circuit	769	12:14:07 63
1907	Nazzaro	120	Dieppe circuit	478.4	6:46:33 70.61
1908	Lautunschlager	120	Dieppe circuit	478.4	6:55:43 69

Labor-saving Devices Used in Grand Prix.

No better proof of the keenness of the contest for the Grand Prix could be found than in the manner in which the tire and gasoline stations—the ravitaillement, as it is called here—had been fitted up. With a few exceptions by firms having little chance of winning the race, whatever help they were given from the outside, there were more labor-saving devices and more elaborate organization here than ever befor.

The old method of handing up gasoline in large tin cans, the bottoms of which were punched in to facilitate emptying was abandoned as far too slow. Panhard, Mercedes, Dietrich, Bayard-Clement, and one or two others had all their gasoline under pressure in a large tank in the ravitaillement pit. A long, flexible tube led from the tank to the cars and allowed filling in but a fraction of the time usually employed.

It was interesting to compare this up-to-date method with the slower ones. Emile Stricker, for instance, the Yankee driver of the Porthos six-cylinder, ran to his stand and yelled for gasoline. It was handed up in large, open-mouthed milk cans; when all that was available had been given the tank of the racer was only half filled, and poor Stricker stamped and bit his fingers in rage as he waited for the small cans to be handed up to him. A similar delay happened to Henry Fournier, which so enraged him that he started up the car for its last lap before the mechanic had got into his seat. The bewildered Italian would doubtless have been left behind had not Fournier leaned out while the car was in motion, seized him by the collar and bodily jerked him into the car. Before the mechanic had recovered his equilibrium Fournier had got into his fourth speed.

There were greater facilities than ever for speed in the changing of tires, though as a matter of fact the performances were not always of the best. Ordinary jacks were not used except on a small proportion of the cars. Panhard and Fiat, among others, had large pneumatic jacks made to fit under the rear axle and raise the rear of the car with two or three turns of a handle. To raise the car was the work of a second and a half; to lower it did not occupy more than a second. Dietrich had a large jack made to fit under the rear axle and provided with two levers about seven feet long. With the driver at one lever and the mechanic at the other, the vehicle was raised from the ground with one simple downward stroke.

Water and lubricating oil were handed up to the drivers in the old-fashioned way, the former in open-mouthed cans and the latter in the metal cases usually supplied by the makers. With the exception of the British Austin cars it was remarked that the racers very rarely took on water.

Spare parts were stocked in abundance. Caskets, spark plugs, nuts, bolts, magnetos, and even radiators, cylinders, pistons and piston rings, sprockets and gears were laid out in perfect order ready to be handed up if the call came for them. But the call never did come, for, with the exception of Erle, who changed a radiator at the second station, the repairs were slight, the cars either being put out of the race in a very damaged condition or through tire and wheel accidents.

Methods of preparing the cars varied with the different drivers. The Itala cars carried a cylindrical gasoline tank behind the driver's seat, of such a size that the inflated tires formed a ring around them. The Weigel cars had a similar arrangement, with the addition of basket work at the base and around the tank in order to diminish the vibration. On the Porthos the gasoline tank was behind the seats and to the rear of this a round tank without a lid, made of the exact size to allow tires to be put around it, while the interior could be used for carrying the pack or any tools most likely to be needed on the race. Each of the cars in this team had also a spare magneto carried on suitable brackets within the frame. As an independent timer was employed a change of magneto could be made just as quickly as the changing of a plug.

The road having been considerably loosened by the speedy voiturettes of the preceding day, flying stones were to be feared. As a protection, the Weigel and the Itala cars carried a fine gauze screen attached to the right hand side of his dashboard in order to protect his face from stones thrown up by a car

ahead. The same driver had his little joke in the form of an enamel plate attached to the side of the car reading, "Dangerous to lean out."

The tarred surface was feared by most of the drivers, who wore not only ordinary goggles, but complete masks, making them altogether indistinguishable at a distance of a few yards. In addition a thick layer of cold cream or other ointment lay under most of the masks. Strang stuck to the ordinary type of goggle; his mechanic, Guichard, who did the same, lost his pair while jumping off the car, and no others being available for the moment, had to make a round with his eyes unprotected.

Several interesting facts appear in the table of the ten fastest laps given below. In the first place, of the nine cars which figure therein, only two finished, Hemery and Rigal. Not one of the speedy Brasiers completed the course. Salzer and Szisz retired in the third round, and Nazzaro and Wagner in the fourth. Credit should be given Rigal and Bayard for their spurt in the eighth lap, which enabled them to slip into fourth place at the finish. It may also be noted that eight of the fastest times were made on the first round; the speed with which they started off brought many of the drivers to grief.

Finished.	Car.	Nation.	Driver.	Time M.S.	Av'gs M.P.H.	Lap.
0.	Mercedes	German..	Salzer	36:31	78.5	1st
0.	Brasler	French...	Bablot	36:40	78.2	1st
0.	Brasler	French...	Baras	36:45	78.0	3d
0.	Braslsr	French...	Thery	37:08	77.3	1st

0.	Braslsr	French...	Baras	37:44	76.0	1st
0.	F. I. A. T.....	Itallan...	Nazzaro ..	37:48	75.9	1st
2.	Benz	German..	Hemery ...	37:55	75.6	1st

Length of one lap, 47.8 miles.

The world's record for prolonged speed on closed circuits still belongs to Nazzaro, with 70.61 miles an hour attained last year at Dieppe. Though this year's cars were faster than those of 1907, as shown by the breaking of the record for one round by no fewer than eleven cars, the average for the total distance fell below that of a year ago by reason of tire trouble, partly caused by the state of the road and partly by the use of a new rim. Salzer, who has the record for one round with a Mercedes car, attained a speed of 78.5 miles for a distance of 47.8 miles, standing start. Last year the best time made by Nazzaro on one round worked out at the rate of 75 miles an hour, flying start. Herewith is the race average of the finishing twenty-three cars:

THOMAS STILL SURE OF WINNING ROUND THE WORLD RACE

BY arriving in St. Petersburg first, which city, according to cable advices to the New York *Times*, the Protos car reached on Monday evening, the Germans have been enabled to win the second prize of $1,000 offered by the Imperial Russian Automobile Club. The definite position of the Thomas car was not known at the time, but according to Lieutenant Koeppen, it had reached Nijni Novgorod, about two days behind the German car. This would not appear to be correct, however, as when last reported the Americans and the Thomas were at Viatka, and Schuster was vainly endeavoring to locate a replacement part that had been lost in transportation somewhere along the line of the Siberian railway. Viatka is on the direct line to St. Petersburg, while Nijni Novgorod is 200 or 300 miles due south on the line to Moscow, which the Germans followed, so that it is unlikely that Schuster would run this distance unnecessarily, merely to look up a replacement part.

Thomas Has Thirty Days' Leeway.

Whether the Protos leads the way into Paris or not will not affect the position of the Thomas, provided the latter arrives there within thirty days of its rival, this being the allowance accorded it for its useless trip to Alaska and principally on account of the fact that the German car was shipped from Pocatello, Idaho, to Seattle, in order to reach Vladivostok in time to start with the others. Had the Protos been compelled to make the trip overland to San Francisco, then to Seattle and thence to Asia, as did the other competitors, it would have been months behind, as it had seriously broken down three times in succession just prior to being shipped to Seattle for repairs.

The arrival of the Thomas at Viatka, July 15, marked the close of the second one of those unfortunate occurrences that have served to delay the car so much during its Siberian trip. Shortly after leaving Ekaterinburg, on July 7, the boundary line between Europe and Siberia was crossed, but long before reaching that point one of the gears had succumbed to the terrific strain of the rain-soaked clay roads. It was temporarily repaired, 30 miles from Obansk, in Siberia, making further progress possible. Perm, in European Russia, was reached July 8, in a driving rain, with the roads in a worse condition than ever. Miller advised waiting as the crudely repaired gear would not stand the ruts and holes that racked the car so fearfully. Schuster determined to go on, however, and this proved his undoing, as the gear gave way again, but even in that condition the car managed to make the 15 miles intervening between it and Viatka without further mishap.

Accidents and Delays Have Been Numerous.

Ever since the accident caused by bumping over unballasted ties on the Siberian railway in the early stages of the journey, which placed the Thomas car five days behind, the Americans have met with a series of misfortunes. All but two days of this had been made by the time the Thomas reached Chita on June 19. Upon arriving at Lake Baikal the Thomas all but caught its German rival, just missing the boat which carried the former across. As a result, there was no gasoline to be had, causing a further delay of nine hours. On June 23 the Thomas was but 100 miles behind, and four days later it caught the Protos at Tomsk, but the ferryboat sunk with the American car, again permitting the Germans to get ahead. But by strenuous effort the Americans once more pushed to the front and July 1 were leading the Protos by a day. Both competitors left the main line of the railway, striking north to Ekaterinburg to the same pass through the Ural range. The Thomas kept on its northerly course through Perm, while the Germans went south through Kasan and Moscow, thus covering a much greater distance in reaching St. Petersburg than would have been necessary by the route taken by Schuster, so that if it had not been for the unfortunate accident to the gear and the delay caused by the loss of the replacement part in transit, the Thomas would have led its rival into the Russian capital by a good margin.

After a silence of more than a fortnight the Zust has been heard of at Krasnojarsk, which is the first report received from the Italians since July 1. It has been meeting with misfortunes and still has 5,600 miles to cover to Paris.

INCREASED EFFICIENCY OF SINGLE MOTOR DRIVE*

By A. L. DIXON, Member Society of Automobile Engineers.

SINCE the introduction, this season, of the single motor drive for heavy commercial trucks, considerable comment has arisen as to the practicability of this type compared with the double motor drive. In adopting the single motor the first advantage gained is decrease in weight, lighter battery, simpler control with a corresponding increase in number of parts thus decreasing the electrical troubles about one-third.

While the above points appeal very strongly to the owner of a power wagon, let us consider its performance from the technical point of view.

Comparing the two types separately we have:

Results of Double Motor Drive.

Weight light—11,610 pounds.

Motor—General Electric Company, 2, 30 amperes at 85 volts, 800 r.p.m.

Battery—Exide, 44 cells, 19 plates, 63 amperes for 4 hours.

Controller—General Electric Company continuous torque, 5 speeds forward, 2 reverse.

Double gear reduction, 13.33 to 1.

Tires—Firestone, front, 36x7 inches; rear, twin, 36x4 inches.

Chain—First red., Morse; second red., Diamond roller.

Bearings—Timken roller on countershaft and wheels; Hess-Bright on motors.

Performance on level asphalt:

Volts.	Amps.	Watts.	Speed	Weight Loaded	Watts. per Ton Mile	D. B. P. Per Ton
85.5	59.7	5,100	6.54	10.95	71.2	24.5

Curve No. 1 shows the performance of the two motor drives.

Showing of Single Motor Drive.

Weight light—9,505 pounds.

Motor—General Electric Company, 40 amperes at 85 volts, 1,200 r.p.m.

Battery—Exide, 44 cells 15 plates, 49 amperes for 4 hours.

Controller—General Electric Company continuous torque; 4 speeds ahead and 2 reverse.

Double gear reduction, 15.23 to 1.

Firestone tires—Front, 36x7 inches; rear, twin, 36x2 inches.

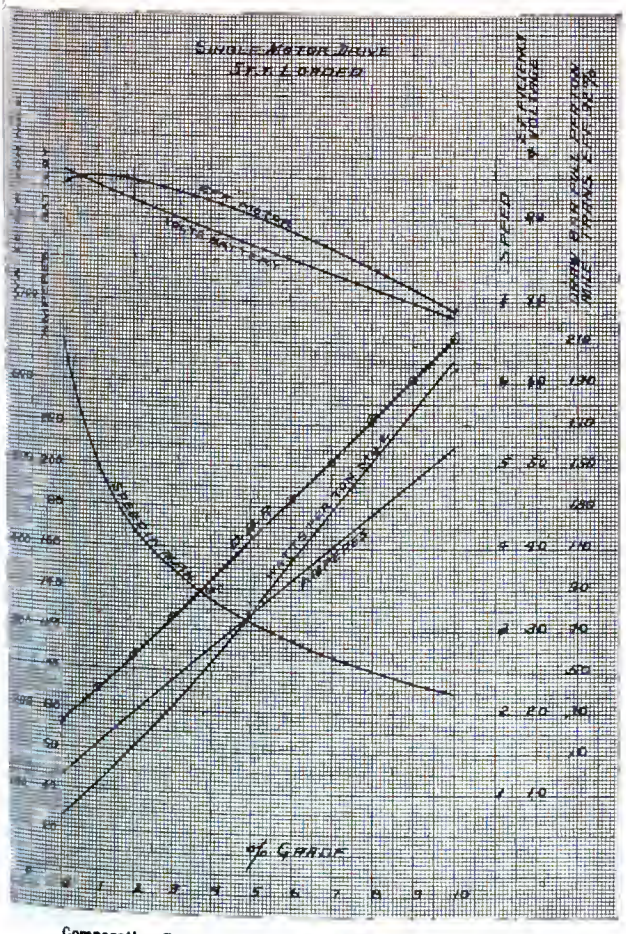
Chain—First red., Morse; second red., Diamond roller.

Performance on level asphalt:

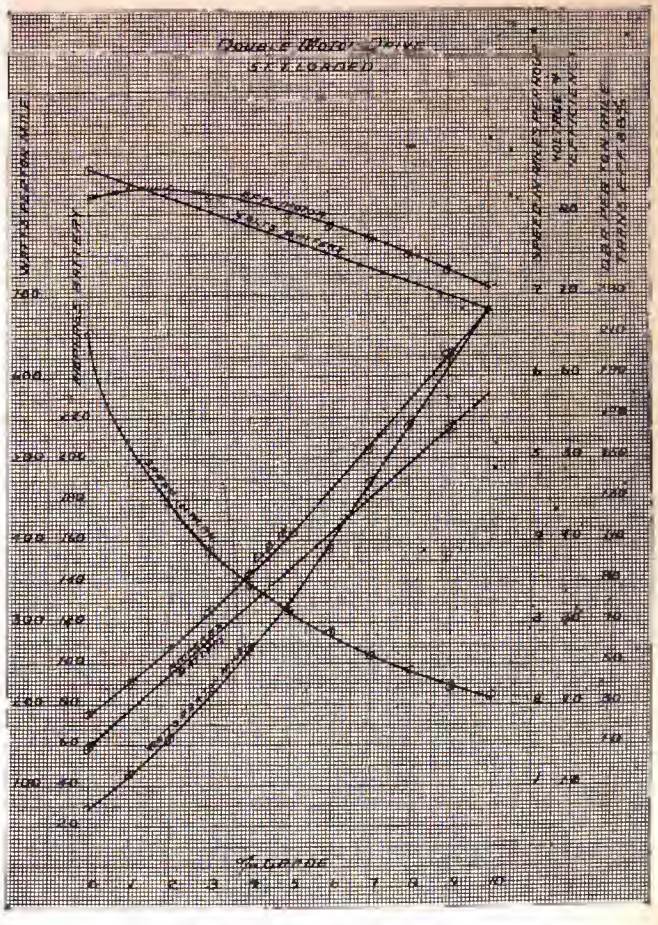
Volts.	Amps.	Watts.	Speed	Weight Loaded	Watts. per Ton Mile	D. B. P. Per Ton
85.5	46.8	3,990	6.50	9.865	62.3	22.3

Curve No. 2 shows the performance of the single motor drive.

*Paper read before the Society of Automobile Engineers on the occasion of the third annual summer meeting at Detroit.



Comparative Performance of Single Electric Motor Drive.



Results Shown by Double Motor Drive.

SINGLE MOTOR DRIVE—FIVE TON TRUCK.

8	72.3	196	14,180	2.41	10.95	538	75	177
9	70.6	213	15,020	2.22	10.95	618	73	200.3
10	68	232	15,780	2.11	10.95	686	71	223

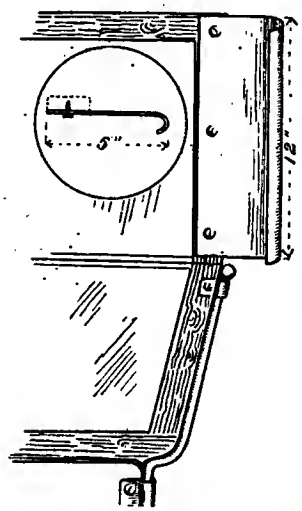
From the above data it will be seen that by using a 15-plate battery with a capacity of 196 ampere hours on the single motor drive, it is possible to get the same mileage as from the double motor using a 19-plate battery of 252 ampere hours. Or with the single motor drive with a 19-plate battery, the mileage would be increased 14 per cent. over the double motor drive. The above article is based on tests made of regular stock cars manufactured by the General Vehicle Company.

HOW AN AUTOMOBILE MAY RUN WILD.

A runaway motor car under ordinary circumstances can only take place on a steep declivity, too steep, in fact, for the brakes, when the driver is on board, but that it is possible for a car to get away "on its own" and "run amuck" amongst the traffic has been shown to be possible on several occasions, and two cases were recorded last week, writes Henry Sturmey, in *Motor* (London). In one case, which occurred in Ireland, the car was left standing, with the engine running, and by some means or other the brake lever, which also released the clutch, got out of its notch, with the result that the clutch went in and the car started, though happily no very extensive damage was done. In the other case, a motorist left his 60-horsepower car in garage and inadvertently left the clutch in. When he came to use his car again, he started his engine on the switch before getting into the car, and the vehicle promptly made a bee line for the door, which it smashed and, passing through, crossed the road and brought up against a wall on the other side, much to the detriment of radiator and lamps, as can well be imagined. These instances, although not frequent, can scarcely be said to be rarities, and it will be seen that they are due to the fact that, in the generally accepted system of car construction to-day, the normal position of the clutch is in engagement, and it is only out of engagement when the driver has taken the needful steps to remove it from that position. Were matters reversed and the normal position of the clutch arranged to be out of engagement with the engine, with which it could only be connected by a deliberate and intentional action on the part of the driver, such occurrences as those above related could not take place. There is no particular difficulty about it, because there are cars which are so constructed, but the general practice is the other way, and, as these incidents show, it contains a fair amount of potential possibility of danger, as there will always be drivers who are not as careful as they should be.

ELIMINATING BACK DRAFTS FROM A WIND SHIELD

THE appended illustration shows a device which an English autoist has adopted in connection with a wind screen, which is a great improvement, says *Motor* (London). As will be seen, it consists in the fitting of what may be termed a side wing with a returned edge, thus increasing the total width and widening the path made by the car through the air, so that the return inrush of air to fill the vacuum commences at a point a little further back and more outwards than usual, thus, to a certain extent, missing the occupants of the car with the air currents. Upon the question of wind screens generally the writer says: I was out with a friend one day in his car, and, as we were running rather fast down a hill, a small boy threw a stone at us. The boy was not very large, and his power of throwing could not have been very great, but the speed at which the car was traveling gave such an impetus to the stone that it passed completely through the hard felt hat that my friend was wearing at the time, and, luckily, did no more damage than to the hat. I remember at the time making up my mind that I would never ride behind a wind screen of glass, as, had we had one that day, it might have meant blindness for one of us. However, after motoring constantly through all weathers, I found myself face to face with the choice of having to use a wind screen or of having to give up motoring altogether, as the rush of wind affected my eyes rather badly. I tried goggles—half a dozen pairs at least—but I found them horribly uncomfortable, so gave them up, and at last went in for a screen. The screen that I am using has the lower half inclined toward the driver, the upper half vertical and adjustable. At first I experienced a good deal of discomfort from the back draft, but now I have overcome this, practically entirely, by adding a couple of side wings to the upper half of the screen. The wings are made of stout brass, of the same length as the upper half of the screen; width about 5 inches and slightly curved forward as shown in the section. I made these myself, making a template first in cardboard. I bent the plates over a broomstick with a rawhide mallet, and countersunk the holes for the screw-heads; the entire cost for the pair, including nickel-plating to match the rest of the metal work on the car, was only a few dollars. So much for this idea. Recently, coming home from Birmingham, we were passing through Merstham, when a small boy picked up a stone with the intention of throwing it at the car. I yelled at him and frightened him into dropping the stone, but, remembering my other experience, I am beginning to feel nervous about that glass screen again. I have seen screens made of glass in which is embedded some fine wire netting. This strikes me as being a good idea, as the netting would hold the fragments together. But why is the lower half of a wind screen made of glass at all?



Improving a Glass Wind Shield.

PRACTICE OF BRAKING WITH THE MOTOR*

By F. N. EUNTL

MUCH has been written concerning the advantages and the disadvantages of braking with the motor. Abroad, and in England particularly, the question has been the cause of raising an extended discussion. The detractors of this mode of braking or imposing the function of a retarding agent upon the motor, claim that it subjects that essential, as well as every element of the transmission, to an excessive strain. Certain it is, that those who doubt the efficacy of those parts should not place their confidence in anything but the friction brakes. Frequently, however, the *theoretical truth* of the matter is to be found among the extreme opinions of both the *pro* and *con* supporters of the argument, but in our opinion, the *practical truth* favors the upholders of the *pro* end, and here is why.

If it be true that the motor and the essentials of the transmission will succumb to the additional strain imposed upon them by utilizing the retarding action of the motor to reduce the speed of the car, instead of resorting to the use of the friction brakes in every instance, they must indeed prove defective in some respect, as the foot-pounds value of that strain is a minimum compared to what the same parts are subjected to under normal conditions of traveling, when the motor is propelling and not retarding. We shall see further that the maximum braking power which can possibly be applied in this manner at the rim of the driving wheel, is only equivalent to 85 per cent. of the power ordinarily delivered by the motor and measured at the end of its crankshaft, when running at normal speed. If the braking effort were measured at the crankshaft of the motor itself, it would not amount to more than 65 per cent. of the power of the motor, the difference between the two figures in question arising from the resistance due to the various parts of the transmission system. In braking, these resistances must be added, but in traveling they must unfortunately be deducted.

But to come back to the subject of braking with the motor, the strain imposed upon the transmission is insignificant as regards the differential, its pinions, the bevels, the driving chains, where they are employed, and the pneumatics; it is insignificant beside the enormous and harmful strains to which these same organs are subjected upon the slightest extra pressure on the pedal commanding the differential brake. Motor braking is a progressive operation; elastic in a word, and that is what militates so strongly in its favor. On a long descent, the motor will prevent the car from gathering speed, if it is compelled to run very rapidly by engaging the gears of the first or second speed. The following experiments show the extent of the retarding power that is to be expected of a motor when acting as a brake. They are the results of the investigations of W. Watson, of the *Automotor Journal*, and permit of determining this value in an exact manner.

A single-cylinder motor of 88 mm. bore by 101 mm. stroke, having a mechanically operated inlet valve, was connected to a dynamo through the medium of a belt, and the energy thus produced was recorded. The diagrams, Figs. 1 to 8, were obtained with the aid of a manograph. The first shows the pressures developed during the functioning of the motor at 1,000 r. p. m. as a producer of energy, and shows an output of 5.94 horsepower. As a preliminary to testing the power absorbed by the motor as a brake, the resistances produced by the electric motor were first calculated and set forth in such a manner as not to conflict with those proceeding from the gasoline motor alone when acting as a brake. All the trials were made at a speed of 590 r. p. m., the motor being at a temperature of 50 Centigrade. The frictional resistances alone, measured after lifting the valves out, amounted to 0.75 horsepower. The valves were then replaced and the admission valve held completely open, the total resistance then amounting to 1.03 horsepower, or .28 horsepower for the operations of aspiration, compression and exhaust, the third part of the cycle having a negative value. Upon closing the inlet valve, the total resistance increased to 1.22 horsepower, or .47 horsepower absorbed by internal work, the resistances due to friction being deducted. See Fig. 3.

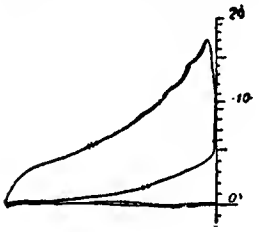


Fig. 1.

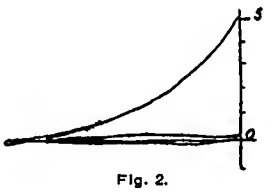

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5.

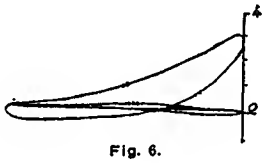

Fig. 6.

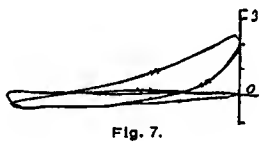

Fig. 7.

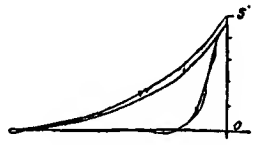

Fig. 8.

On holding the exhaust valve, the diagram, Fig. 8, was obtained, the motor then functioning as a compressor and providing a resistance amounting to 1.60 horsepower. If the exhaust valve is caused to open on each third stroke as an air inlet valve, something which could be done without involving any great amount of complication, the total resistance would then be 2.40 horsepower, corresponding to 65 per cent. of the actual power of the motor when turning over at the rate of 590 turns per minute.

The following table gives a resumé of the experiments:

Working Conditions.	Total Resistance.	Net Force.	Indicated Force.
No pressure	.75 h.p.	0	0
Inlet open	1.03	0.28	0.27
Inlet closed	1.22	0.47	0.46
Inlet closed; half compression	1.39	0.64	0.70
Inlet open; half compression	1.49	0.74	0.79
Inlet and release open	1.63	0.88	0.91
Inlet closed; release open	1.69	0.94	0.94
Inlet open; exhaust closed and held	1.60	0.94	0.88
Inlet through exhaust each third stroke	2.40	0.94	1.65

*Translated from *La Locomotion automobile*, by Charles B. Hayward.

HANDY HINTS FOR THE MAN WHO DRIVES

ANY self-respecting shop man will clean a shaft and bearings carefully before assembling. He will also at least go through the motion of cleaning the flat contact surfaces of joints and threaded surface of bolts and ends before he puts them together. But how many men really appreciate the fact that particles of dirt, however minute, between hard contact surfaces act something like balls, and not only separate the surfaces but make it easy for them to move relatively to each other? When parts are assembled in this manner the dirt is probably crushed and imbedded in the surfaces adjacent to the bolts, but between the bolts, unless the materials concerned are quite soft, the surfaces are sprung apart more or less. This possibly does no great harm, but when parts are dismounted and are assembled frequently it is only a question of time and carelessness for every contact surface to become so roughened that a true fit is out of the question. A careful workman will save a clean piece of waste for this part of his work, even if it is the last he has and he must wipe his hands on something else.

When a Spring Leaf Breaks.

The breakage of a spring may be serious or not according to where it occurs and how many leaves are involved. If only one leaf is broken the others will probably carry the load if care is taken not to drive fast over rough spots. The broken leaf, however, must be held in place to act as a spacer for the other leaves. To accomplish this the whole spring, if the break is in the middle, or half of the spring, if the break is near one end, must be wound tightly with clothes line or some other rope of about that size (Fig. 2). The winding is started at the small end *C* (Fig. 1), after which the rope is passed once around the spring close to the eye, tied in a single knot, and the short end is led along the top of the spring, where it will be bound tightly by the succeeding turns. The rope should be wound for some distance past the point of the break, and the free end may be fastened either to the spring seat or to the other end of the spring. If two or more leaves are broken at the middle or elsewhere the remaining leaves must be reinforced by a stiff bar of hard wood *A* (Fig. 2), laid along the top of the spring and bound in place by clothes line in the manner described in the above paragraph. The center of the bar should be over the break, and should be blocked up by suitable pieces of wood *B*, 3 or 4 inches long, so the ends of the bar will have to be sprung downward to bring them in contact with the top leaf of the spring. This puts the bar under some initial tension and increases its efficiency. In case it is the top leaf of the spring that is broken, the bar, such as just described, is necessary even if no other leaf is broken. In this case, however, it will be well for the bar to make contact with the spring leaf all along its length, and for this purpose its under surface *D* (Fig. 3) may be whittled to a curvature slightly greater than the curvature of the spring. This will produce the initial tension required, by the bar straightening itself to make complete contact with the spring when the clothes line is wound on. As a matter of safety it will be well to improvise a bumper between the spring and frame to prevent the damaged spring from being flexed beyond its safe limit. If a rubber bumper is not available one may be improvised by laying a stick of wood on top of the center of the spring and binding it on with rope wound in as many parallel turns as possible (Fig. 4). The rope will act as a cushion, and by using a considerable number of turns the shock will not be localized at one point of the frame.

Fig. 1.

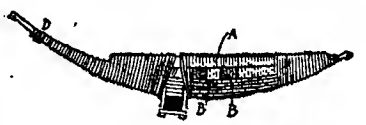

Fig. 2.

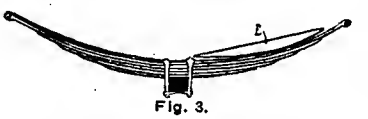

Fig. 3.

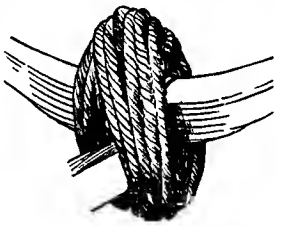

Fig. 4.

The Oily Canvas Apron.

The canvas apron used as a dust screen underneath many cars is a serious menace, and should not be tolerated without extreme precaution against the possibility of its catching fire. A long hill, an imperfectly working carbureter which forces the car to first speed instead of second, and a radiator something less than full, make a combination which can happen any day; and if under such circumstances the oil-soaked apron comes in contact with the exhaust pipe it takes but a few seconds to start a blaze. Then the only salvation is in quick action with a jackknife, by which the apron may be cut loose before the fire communicates to the woodwork or sets the gasoline tank boiling. Since the flames are fed by the oil drippings, and not to any important extent by the canvas itself, it follows that the insertion of an asbestos section around the exhaust pipe would not help matters. A tin section, if it had sufficient slope to insure the oil on it draining away instead of accumulating it, undoubtedly would be much safer, and for an extra precaution the upper half of this slope could have a raised flange around the hole through which the exhaust pipe passed, thereby preventing the oil from dripping on the pipe. Of course, the hole should be large enough so that the pipe would not ordinarily touch the tin.

Annoyance of Clogging Gas Tubes.

The small copper tubes commonly used for connecting the generator and the lamps rapidly clog, and in the course of a season or two they require attention. Most of this clogging will be found to take place at the ends and wherever moisture can accumulate. Water in any part of the pipes is a great annoyance, as it causes flickering of the lights, and the piping should throughout be arranged to drain the pipes toward one or both ends. It is better and generally easier to drain back to the generator, but in case this cannot be arranged the forward ends of the pipes may be cleared of water by disconnecting the rubber tubes and blowing through with a tire pump. Pipes found to be clogged may frequently be saved by cutting off an inch or two from their ends. Occasionally this results in small explosions, due to detonation of the acetylide of copper which generally forms in the pipes, and it is well to keep one's eyes and fingers out of range of the ends of the pipes while the sawing or cutting is going on. A few car makers use a larger than standard size of tubing for this work, the aim being to avoid clogging by small particles. This aids matters wonderfully. A few repairmen clean these pipes by forcing water back and forth through them, which is correct, provided proper means are followed to get the water well removed from the pipes after the cleansing operation is completed. Keeping these tubes clean is a very small matter in itself, but it is one of the innumerable little odds and ends about a car, the proper maintenance of which makes for comfort in its running, or the reverse. The careful man's car is always ready to take the road in good shape, whereas the shiftless driver's car is always minus something or other and is always causing trouble in an endless number of ways.

LETTERS INTERESTING AND INSTRUCTIVE

COMPOUND ENGINES ON THE AUTOMOBILE.

Editor THE AUTOMOBILE:

[1,474.]—Can you tell me if compound gasoline or gas engines have ever been built? Why should not compounding be an advantage in the internal combustion motor the same as it is with steam? There seem to be great possibilities in the subject and it appears strange to me that no one has taken it up thus far or if this has been done, that so little has been heard of the results. Some light on the subject would doubtless be of interest to the majority of your readers. COMPOUND.

Norristown, Pa.

Compound gas engines have been built for some years past, and in certain cases have been found advantageous for stationary power service, but the gain is not sufficient to act as an inducement to their further development at the present moment, apparently, as there are comparatively few firms building such engines. A compound gasoline motor has been built in this country for several years past at Middletown, Conn., the car itself being known as the Compound. There are now several taxicabs running around New York City that are fitted with this type of motor, built by the concern in question. The fact that the car has not met with any great success in the three or four years it has been on the market seems to be due more to the fact that its builders have constantly been in financial trouble, rather than to any inherent defect, either in the principle or the construction of the motor. The latter has two high-pressure cylinders, placed on either side of the low-pressure cylinder, into which they exhaust alternately. We have never seen the result of any brake or efficiency tests as compared with a single-acting, two-cylinder four-cycle motor, and hence cannot say how the compound compares in this respect with the simple engine. It is not possible to compare the internal combustion motor with the steam engine where compounding is concerned, as the active fluids are of a totally different nature. Steam will retain its heat, and, in consequence, its pressure for a much longer period, than will the mixture of gases resulting from the explosion in the cylinder of gasoline engine. On this account it has been found advantageous to expand steam three, or even four, times in an engine before exhausting to the condenser. Steam is utilized at a comparatively low pressure, say 160 to 200 pounds to the square inch at the boilers, insuring a mean pressure of considerably better than 100 pounds to the square inch on the piston of the first, or high-pressure, cylinder, assuming 160 as the boiler pressure. The piston of the intermediate cylinder will receive about half or less than half the mean pressure of the first cylinder, and third expansion will result in exhausting the gases at about atmospheric pressure or slightly below.

On the other hand, the pressure in the internal combustion motor will rise as high as from 300 to 400 pounds to the square inch at the point of ignition, but will drop to 40 pounds or less at exhaust, even in the short-stroke automobile motors, so that the mean pressure will scarcely exceed 60 to 70 pounds per square inch on the piston throughout the stroke. It is this extremely rapid drop in temperature and pressure that prevents the efficient use of the products of explosion in a further expansion taking place in another cylinder. The loss caused by the transfer from the high to the low-pressure and the condensation caused by coming in contact with the comparatively cold walls of the latter, is so great that compounding seems a doubtful advantage, particularly on the automobile motor. The parent Daimler works in Germany experimented with the compound motor two or three years ago and it was claimed that the result of their investigations was a motor much superior than those previously brought out, an improved method of transfer of the charge having been adopted.

WHAT CONSTITUTES "RUNNING" A CAR?

Editor THE AUTOMOBILE:

[1,475.]—Last week's "Automobile" contained an inquiry concerning the smallest essential individual piece of a gasoline automobile. The inquiry was prompted by a wager that the writer could not take from a large touring car that had just arrived at the curb, an individual part, so essential that without its replacement the car could not continue its journey, said part to be so small that it could be concealed between the thumb and forefinger with ease. The wager was accepted, and the writer removed the small rubber washer from the valve in the air stem of one tire. The tire went flat, and the bet was won. The little rubber washer weighed exactly two grains on a jeweler's scales.

Since the question appeared in "The Automobile" numerous letters have been received suggesting parts as called for in the query, but no one has so far suggested the right answer. The query called for the smallest essential individual part, and a combination of two or more pieces does not properly come under that description.

Marshall, Minn. A. D. HARD, M.D.

If you will refer to your original letter on this subject, you will find that no mention was made of the condition of being able to conceal the smallest essential part between the thumb and forefinger. Furthermore, we do not consider that the washer in question meets the requirements of a part so essential that without its replacement the car could not continue its journey. Have you never heard of a car running on a flat tire or on the bare rim? We have known of instances where not merely a few miles, but several hours' run have been accomplished on the rim. In your previous letter you stated that the part was to be such that without it the car could not be run. It may not be economical or good policy to run a car on a flat tire or without any tire, but it must be admitted that there is nothing to prevent its running, if the owner wishes to do so. If, as expressed in your former letter, the condition of the bet was based upon the ability of the car to run after you had removed the smallest essential part, your friend of the flat tire gave up entirely too easily when you took away the washer.

ADVICE FOR A PROSPECTIVE BUYER.

Editor THE AUTOMOBILE:

[1,476.]—How can I find out the good or bad qualities of the Aerocar, made by the Aerocar Motor Company of Detroit? Can you tell me anything about it? N. A. BIORN, M.D.

Ada, Minn.

"Ask the man who owns one," would appear to be pretty good advice on a subject of this kind, but where you are not in a position to get a frank opinion from an unbiased personal acquaintance, about the only thing to do is to note what the car can do on as strenuous a demonstration as the agent will grant, and dealers are very liberal in this respect where a buyer means business. It is sometimes possible to find an agent who will frankly tell you the weak points of a car, as well as its good ones, though the genus is rare, and it doubtless would be well for all concerned if there were more of them.

EFFICIENCY OF METHODS OF TRANSMISSION.

Editor THE AUTOMOBILE:

[1,477.]—I presume the question has been threshed out at great length in the past, when interest in the subject was keener, but I would like to revive it temporarily for my own information and doubtless that of others. Of course I realize that the chain-driven type of automobile has almost disappeared and that, sooner or later it will give way altogether to the shaft-driven type. What I wish to learn, whether this has been done as the result of the technical disadvantages of the chain; that is, its lesser efficiency, or merely for looks and silence. H. L. ABERCROMBIE.

Washington, D. C.

Drive by double side-chains is slightly more efficient when the chains are new and well-lubricated than is the case with the shaft and bevel gear drive, although in the case of an

automobile the shaft and bevel gears are present in either type, the chief difference lying in their location and the necessary angularity of the propeller shaft. However, the fact that in the chain-driven car, the clutch, gear-set and countershaft are all in the same plane, is an advantage, which is further added to by clean driving chains. But as the latter become dirty, and as the sprockets and chain links wear, this advantage is more than offset, so that under ordinary service conditions of running the shaft drive is really the more efficient. The question was really not one of efficiency, however, but rather one of silence and greater ease of protecting the driving mechanism. The propeller shaft and bevel gear readily admit of this, and while the chain also does so, in that a boot or case may be put over each chain, the latter method of protection never appears to have attained any popularity. Even with clean chains the chain-driven type of car is necessarily more noisy and there seems to be little doubt that the attainment of silent-running has really been the chief moving factor in the adoption of the shaft drive.

WHAT CAR FILLS THESE REQUIREMENTS?

Editor THE AUTOMOBILE:

[1,478.]—Will you kindly inform me what car (automobile) will meet these desired requirements of a physician, to wit: Weight of runabout not over 1,500 pounds, track 60 inches, wheelbase 90, horsepower 20-24, radiator and pump, engine four-cylinder, upright, roller bearings throughout, full silliptic springs, front and rear, tire size 30 by 3 1-2, shaft drive. All other parts up-to-date and durable; suitable for sand and mud. Hard work all the time.

Mobile, Ala. W. R. JACKSON, M.D.

Judging from the immediate response to a recent letter from a would-be purchaser of a car who did not expect to have his ideal realized for some time to come, there must be not a few makes on the market at present that will fulfill your requirements regardless of how exacting they happen to be. Barring a few exceptions to your specifications, it is not difficult to call to mind several cars of the kind. There is one bad feature about your proposed car, and that is the use of 30-inch wheels. Such small wheels not only make uncomfortable riding, but are a very poor investment from the point of view of tire expense. A 34 by 3½-inch tire will give very much better service, difference in first cost considered, than will the 30-inch size, and if you are willing to specify 36-inch wheels your car will be that much better for them. As a matter of fact, we doubt very much if you will find any 24 to 30-horsepower four-cylinder cars on the market to-day with smaller than 32-inch wheels, while the majority are equipped with either 34 or 36-inch sizes. Any of our readers who think they can supply a physician's car for the strenuous service outlined may compare their specifications with his in these columns.

REGARDING THE USE OF A DECARBONIZER.

Editor THE AUTOMOBILE:

[1,479.]—There is a certain mixture advertised under the name of Radium Decarbonizer. The makers claim that by injecting a few ounces into cylinders or splash tank of an auto engine, all carbon deposits will be dissolved, and pass out of muffler in black smoke. They claim also that Decarbonizer will not injure in any way any part of the engine. In fact, Decarbonizer works on carbon and nothing else. I have been trying to find some one in this section who had tried Decarbonizer. Garage keepers and expert chauffeurs, whom I have asked, advise me to let some other fellow try it first, and until then to stick to kerosene and a scraper to remove carbon. Possibly some of your New England subscribers have tried Radium Decarbonizer, and if so, they could give some advice through "Letters Interesting and Instructive."

Concord, N. H. C. F. M. STARK.

In the past half year we have received quite a number of inquiries on this subject and if any of our readers who have had personal experience with Radium Decarbonizer in their motors will contribute the resulting knowledge for publication in these columns, we have no doubt it will prove beneficial to a great many other subscribers besides those who have taken the trouble to inquire in the past.

CORK INSERTS WOULD REMEDY DIFFICULTY.

Editor THE AUTOMOBILE:

[1,480.]—In your issue of a recent date there appears a letter from R. S. Trulock in which he states that he has tried various remedies to prevent the leather cone clutch in the planetary gear of a 16-horsepower touring car from slipping. We should have written to Mr. Trulock personally in relation to his difficulties were it not for your comments following his letter in which you say "no friction clutch can be made to hold where it is exposed to lubricating oil in any quantity, and that nothing can be put on the facing which will prevent the lubricating oil from causing it to slip," also suggesting a rather expensive system of guards to prevent the oil from reaching the clutch.

We have during the past three years used the columns of "The Automobile" and other publications in describing the results obtained by cork inserts, and technical writers for the automobile publications have said that cork inserts in leather-faced cones practically entirely prevent the trouble referred to, as the coefficient of friction of a cork insert clutch is not materially affected by oil.

Leather-faced cone clutches fitted with cork inserts have been used in some eight thousand automobiles, being the standard equipment of the Pierce, Pope-Hartford, York, Chadwick, De Luxe, and nearly fifty other makes of cars. As evidence of what cork inserts do, we desire to call your attention to the fact that 50 per cent. of the cars now contesting for the Glidden prize are fitted with cork insert clutches or brakes.

Under the circumstances we think that those in trouble should be advised of this fact rather than to have suggested to them a more expensive, and perhaps less satisfactory, method of eliminating the difficulty. NATIONAL BRAKE & CLUTCH CO.,

W. W. WHITCOMB,

Boston, Mass. President.

WANTED: A REAL HILL CLIMB FOR STOCK CARS.

Editor THE AUTOMOBILE:

[1,481.]—Can you tell us whether or not there is to be a hill-climbing contest on Mt. Washington this summer? We are looking for contests of greater length than the average climb, which at present seems to be in vogue. If you can consistently make any mention of the points which we refer to in this letter, would be glad to have you do so, as we believe that among the clubs which watch the column of "The Automobile" some would take the hint and arrange a contest where cars will undergo a hard, 3, 4 or 5-mile grind.

We believe that the automobile industry owes to itself and the public a contest of this sort, which will demonstrate actual climbing ability under the most adverse road and grade conditions. In such a contest, the special featherweight "sky-rockets" which are entered as stock cars, would be eliminated. In the hill climbs such as we have been having, the manufacturer who enters a genuine stock car (in all that the term applies), has very little chance against cars equipped with a paper body, postage stamp mud guards, and ratio of gearing adjusted to suit conditions exactly.

If we cannot pit our cars against anything but these freaks, will someone give us a climb so severe that they will go to pieces. A car loaded with dynamite and stripped of every ounce of weight possible, will stand together long enough to fly up a smooth half, or three-quarter mile grade; but give us a climb which will demand strength and real endurance in every entry, and the manufacturers who are really racing stock cars will rise up and thank you for any effort you put forth to secure such contests.

CAMERON CAR CO.,

Beverly, Mass. Sales Mgr.

TO PREVENT RUST ON WHEEL RIMS.

Editor THE AUTOMOBILE:

[1,482.]—Referring to Robert Jewett's inquiry, No. 1460, in the July 9 issue of the "The Automobile," if the wheel rim is painted with a mixture of shellac and finely pulverized flake graphite (mixed to a stiff paste), rust on wheel rims with its attended bad effect upon tires may be largely eliminated or entirely eradicated. After treating the rims as indicated above, it will be found that they are very even and a waterproof film of great smoothness is formed. The graphite is absolutely inert and there need be no apprehension regarding a detrimental effect upon the rubber.

If the whole inner shoe is painted with a mixture of graphite and shellac, there will be little tendency for the tube to stick. We have been advised by some tire manufacturers that they use Dixon's Flake Graphite as indicated above. In this connection, would call attention to the advisability of treating all threaded connections with a mixture of flake graphite and oil. It will be found that the connection can be easily taken apart and there will be no tendency for the joint to be tightly rusted.

Jersey City, N. J. JOSEPH DIXON CRUCIBLE CO.

THE AUTOMOBILE CALENDAR.

AMERICAN.

Shows and Meetings.

Dec. 31-Jan. 7..—New York City, Grand Central Palace, Ninth Annual Automobile Show, conducted by the American Motor Car Manufacturers' Association, with Exhibits by the Importers' Automobile Salon, Inc., Alfred Reeves, general manager, 29 West 42d St.

Jan. 16-23.....—New York City, Madison Square Garden, Ninth Annual National Show of the Association of Licensed Automobile Manufacturers. Office of Secretary, 7 West 42d St., New York City.

February, 1909..—Chicago Coliseum and First Regiment Armory, Eighth Annual National Exhibition, National Association of Automobile Manufacturers. (Exact date to be announced.)

Races, Hill-climbs, etc.

Aug. 14.....—Chicago, Third Annual Algonquin Hill Climb, Chicago Motor Club.

Sept. 5-9.....—San Francisco-Los Angeles Reliability Run, Automobile Dealers' Association of San Francisco.

Sept. 14.....—Chicago, Annual Economy Run, Chicago Motor Club.

Oct. 24.....—Vanderbilt Cup Race, Long Island Course, auspices of Vanderbilt Cup Commission.

Nov. 26.....—Savannah, Ga., Grand Prize Race, Savannah Automobile Club.

FOREIGN.

Shows.

Oct. 11-18.....—Paris, International Congreee and Public Exhibition on Roads and Road Making for Modern Locomotion, French Ministry of Public Works.

Nov. 28-Dec. 13—Paris, Eleventh Annual Salon de l'Automobile, Grand Palais, Automobile Club of France (Pleasure Vehicles, etc.)

Dec. 22-29.....—Paris, Eleventh Annual Salon de l'Automobile. (Commercial Vehicles, etc.)

Races, Hill-climbs, etc.

Aug. 12.....—Ardennes Circuit Races and Coupe de Liederkerke, Automobile Club of Belgium.

Aug. 29-30.....—France, Mont Ventoux Hill Climb, Vaucluslen Automobile Club.

Sept. 1-8.....—French Voiturette Contest, Auspicee "L'Auto."

Sept. 6.....—Bologne, Italy, Florio Cup Race, Automobile Club of Bologne.

September.....—Paris, Vichy Aeroplane Competition, $4,000 Prizes, Aero Club of France.

Oct. 11.....—Berlin, Germany, Gordon Bennett Balloon Race, Aeronautical Club of Berlin.

AMERICAN AUTOS IN PALESTINE.

A report from the consul at Jerusalem, Thomas R. Wallace, says that a party of American tourists made a trip through Palestine this spring in an automobile without encountering any great difficulty. Great interest has been aroused throughout the district, and a number of people are talking of investing in cars. The consul recommends a light, strong car with high clearance, a good hill-climber, and selling at a medium price, and suggests that a repair and supply shop would increase the chance of sales. Under the present law permission must be obtained from the Turkish Imperial Government to use a car in the country, and as this may be granted or withheld at the whim of some official, the automobile's status is not exactly settled yet.

AUTOS HAD BECOME EDUCATED.

Some of the villagers were overheard discussing the Amir's motor car, says the *London Spectator*. "It is not a carriage, for it has no horses," said one. "It is not a train, for it has no rails," said another. "My brothers," said the oldest of the graybeards, "ye are as fools having no understanding. For fifty years the sahibs have been training their devil carriages to run on rails. Now at last they have learned to run by themselves."

A GREAT MOTOR BUGGY STATE.

INDIANAPOLIS, IND., July 20.—In no other State in the Union are the carriage and automobile industries so closely allied as in Indiana. The carriage factory of any importance at all, or the carriage repository, without one or more automobile agencies is very largely in the minority according to some of the recognized authorities of both trades.

With one notable exception, that of the Studebaker Bros. Manufacturing Company, of South Bend, carriage factories so far are confining their efforts largely to the high-wheeled motor buggy, so far rather an untried quantity among Indiana dealers.

Of the 40 concerns manufacturing motor buggies, eleven are located in Indiana and a twelfth company will bring out a vehicle of that type within the next few weeks. Within the next six months half a dozen other Hoosier carriage concerns will have motor buggy models out, so that the situation next season will be watched with no little interest.

Indiana companies now manufacturing motor buggies are: Albany Automobile Company, Albany; Butler Company, Butler; Economy Motor Buggy Company, Fort Wayne; W. H. Kiblinger Company, Auburn; T. J. Lindsay Company, Indianapolis; Mier Carriage & Buggy Company, Ligonier; Postal Auto & Engine Company, Bedford; Reeves Pulley Company, Columbus; Single Center Buggy Company, Evansville, and Zimmerman Manufacturing Company, Auburn.

HAND BOOKS FOR AUTOMOBILISTS.

Italian Club's Annual Touring Handbook Ready.—There has just appeared for the year 1908 *l'Annuario dell'Automobilismo del Touring Club Italiano*, this being the official title of the yearbook of the Italian automobile club, which has its headquarters at Milan. It is a conveniently arranged volume of several hundred pages, printed on thin paper to keep its size within the limits of a pocket, and contains every item of information that the tourist can possibly need, not alone when traveling through Italy, or about to enter that kingdom, but also concerning the remainder of the Continent. Some idea of the thoroughness with which it has been prepared may be gained from the fact that no less than 1,000 places at which gasoline and lubricants may be obtained are listed, in addition to some 1,500 garages, 2,000 hotels and 1,200 repairmen, all of which have the official sanction of the Touring Club, and whose capacities and qualifications are set forth in the lists. Americans contemplating a tour through the delightful scenery afforded by Italy should not fail to avail themselves of this great fund of information, which, together with the other advantages afforded by the Italian Touring Club, may be obtained through membership in the American Automobile Association.

Route Book, Automobile Club of France.—The ninth annual edition of the *Annuaire de Route de l'A. C. F.* is now off the press. It has been enlarged by 70 pages since the edition of 1907 and contains a great deal of additional information, now giving the addresses of all supply depots, repair shops, builders, garages, hotels and the like both in France and the remainder of the Continent, besides 3,000 names of automobile dealers. It also contains the address of every club affiliated with the A. C. F., local touring committees and the like, in addition to which there is a special chapter devoted to customs, tryptiques, methods of shipment, tariffs, telegraph and postal rates, average price of gasoline, oil and similar supplies in practically every country of the Continent, as well as Great Britain and the United States. A great many itineraries for both France and other parts of Europe are given, as well as something like 150 new maps of cities, showing where to find the best hotel, garage, railway station, telegraph office and the like.

The French Society of Engineers has awarded its annual prize to M. Robert Esnault-Pelterie for his article upon lightweight motors.

CONCERNING AUTOMOBILE COMPETITION.

In the progress of the automobile, competitive events of various kinds have been of unquestioned benefit, resulting in better vehicles and calling widespread attention to the industry itself. In parts of the country where the automobile is of recent introduction, there is still need and advisabilty for diversified contests under the auspices of the local club or local trade body, or, better yet, under some sort of joint arrangement, for it is a natural sequence that the man who pays the bills should have something to say in the premises—and this holds good to an even greater degree when it comes to national events with their increased expenses. Wherefore the existence of the now perfected General Conference Committee involving the American Automobile Association and the N. A. A. M. and the A. M. C. M. A.

That it should come within the province of this committee to decide what events are to be classed as national or international, is logical and expected, and while there will always be those who, for the sake of personal and temporary gain, will find ways of evading that which is for the common good, it is a certainty that the American makers are determined to countenance and support only those contests in the instituting of which they have a voice, for, let it again be remembered, they pay the bills. The decision of the N. A. A. M. to notify the foreign clubs that the A. A. A. is the seat of sport and other automobile government in this country, and that only through this channel will international conditions find acceptance, is action that is a part of the program outlined for the future. The particular thing aimed at at this time is the ridiculous attitude of the foreign clubs in threatening to bar from competition abroad the American concerns which participate in the Vanderbilt Cup race. We *must* run our race according to the foreign rules, though we had naught to say in their framing!

Most extraordinary is the manner in which the A. C. A. has convinced itself that it is in honor bound to hold a race in the South for those manufacturers of foreign automobiles who have been inspired to find grievous fault with the American rules for the Vanderbilt Cup race in America. True it is that they have greater speed than ever, these 1908 Grand Prix cars, and also possess horsepower in excess of what can be utilized over any road constructed, yet it seems that—according to the much-referred-to rules—they do not have quite as much piston area as some of the American cars which were ready for a 1907 race that was not held, and which the American makers would like to use this year before sending them to the scrap heap. It was not possible to race these cars in the 1908 Grand Prix of France, and so one American maker went to the heavy expense of fitting up another car of less piston area and also less horsepower than any other car in the race and went abroad, handicapped and illy prepared, to meet the best lot of racing craft that has ever engaged in international automobile sport.

Between now and October 24 the foreign maker could spend a few hundred dollars in giving his cars more piston area—though it appears to have been demonstrated that the longer stroke answers adequately—but this would inconvenience him quite a bit, and, then, there is the expense to consider. Consequently, it is up to the American makers to get busy at once and build new cars, for they are well able to bear the expense, and, of course, they want to be as courteous as possible to the foreigners who race in America for the sole purpose of assisting them in the sale of their product. If the foreign makers are asked to repeat the Grand Prix in sideshow style, the race will not be intensely interesting. There should be some hastily built American cars of the proper piston area to supply the "also ran" contingent.

But it is apparent that the great bulk of American makers are quite firm in their adherence to the classic Vanderbilt, to be run within flashlight of New York City, over the best course in its history, and before a million and more spectators. And the foreigners are welcome—ten from any country, not five as in previous years—but if they technically fear a little more piston area and will not allay their apprehension by spending a few dollars, then their places will be filled by more Americans, who otherwise would be limited to ten in number. In the Grand Prix every maker had the right to enter three cars, and so France supplied nearly half the entries and thus had the best chance of all to win. But here in America the American maker asks no advantage in numbers. He does ask, however—and intends to have—his rights respected when it comes to the acceptance or the rejection of so-called international rules.

Coercive efforts will result fruitlessly, as is made very clear by the decision of the Central Conference Committee, and, since the game is to be played along the line of disqualifying, those who participate in unsanctioned contests will find the Long Island Motor Parkway a closed thoroughfare as far as they are concerned, to say nothing of all other regular events. If for the moment the American maker finds that he cannot compete in the Grand Prix of France, he is not likely to lose much sleep, for he will pursue the even tenor of his way and continue to produce and sell more automobiles than several European countries combined. And that idea of having the A. A. A. tour for 1910 in the British Isles may become more than a suggestion.

AMERICAN MAKERS WILL SEND WORD TO FOREIGN CLUBS

NOW it is the National Association of Automobile Manufacturers which will notify the recognized automobile clubs of Europe that in this country it will participate only in events conducted under the rules of the American Automobile Association, which it recognizes solely as the governing body in this country and which it will assist in maintaining its supremacy. This action was taken at a meeting of the executive committee, held in New York City, July 15, those present being the following:

Thos. Henderson,	representing	the Winton Motor Carriage Co.
S. T. Davis, Jr.	"	" Locomobile Co. of America.
G. W. Bennett,	"	" White Company.
Charles Clifton,	"	" George N. Pierce Co.
W. E. Metzger,	"	" Northern Motor Car Co.
S. D. Waldron,	"	" Packard Motor Car Co.
W. R. Innis,	"	" Studebaker Bros. Mfg. Co.
C. W. Hildebrand,	"	" Stevens-Duryea Co.
L. H. Kittridge,	"	" Peerless Motor Car Co.
W. M. Lewis,	"	" Mitchell Motor Car Co.
R. D. Chapin,	"	" E. R. Thomas-Detroit Co.

S. A. Miles, General Manager.

The subject came before the meeting as the result of action taken at Buffalo, July 14, at a session of the General Conference Committee of the American Automobile Association, the National Association of Automobile Manufacturers, and the American Motor Car Manufacturers' Association, when it was decided that it would not be advisable or just at this late day to change the rules for the Vanderbilt Cup race for this year. The manufacturers not only adopted a resolution indorsing this action, but decided to advise the recognized clubs of Europe that the manufacturers regard and will recognize only the American Automobile Association as the governing body of the United States, and that they will support only such events as are organized or sanctioned by the A. A. A. The attention of clubs of Europe, and of manufacturers, owners, and drivers of cars will be called to the fact that participation in any other event will lead to disqualification, which means that offenders will be debarred, not only from the minor events, but from the Vanderbilt Cup race, and from all events to be conducted on the Long Island Motor Parkway, which is, of course, the greatest speedway in the world.

The committee considered a proposition to conduct a transcontinental contest between New York and San Francisco; learned that the proposed event had not been sanctioned and would not be sanctioned without the consent of the manufacturers, and decided that such a contest is at present unnecessary. The same action was taken in the matter of certain proposed race meets in the neighborhood of New York, which, according to report, certain promoters have decided to hold with or without sanction.

The method of space allotment at the Chicago show was discussed at length, but will form the subject for August 5.

ANNUAL GOOD ROADS AND LEGISLATIVE CONVENTION ASSURED

THE success of the Good Roads and Legislative Convention held at Buffalo, July 7 and 8, by the American Automobile Association, the National Grange, and the American Roadmakers' Association, will probably lead to the calling of a similar convention each year. Resolutions passed follow:

Resolved, That in view of the signal success attending the convention held this year, a national convention of similar character be held annually, and that the national committee having in charge such convention for the year 1909 be as follows:

Robert P. Hooper, Philadelphia, chairman A. A. A. Good Roads Board, Chairman.

Ex-Governor Nahum J. Bachelder, Concord, N. H., master of the National Grange.

James H. MacDonald, Hartford, Conn., president American Roadmakers' Association.

Charles Thaddeus Terry, New York, chairman A. A. A. Legislative Board.

S. D. Waldron, Detroit, Mich., representing the National Association of Automobile Manufacturers.

Frank B. Hower, Buffalo, N. Y., chairman A. A. A. Touring Board.

Alfred Reeves, New York, representing American Motor Car Manufacturers Association.

William H. Hotchkiss, Buffalo, N. Y., president American Automobile Association, ex-officio.

Resolved, That the president of the American Automobile Association be and hereby is authorized to appoint an executive committee of twenty-one members, including the nine members composing the committee upon the national convention of 1909; the duty of which executive committee shall be to see to it that the plans and purposes determined by the national convention of 1908 shall be carried out to their consummation, and that the measures approved by the convention be pressed to passage and enacted into law in the various States of the Union and by Congress.

Resolved, That such executive committee shall have and is hereby given power to add to its membership, by a two-thirds vote of its members, the representatives of such other body or bodies as may add strength to the movement for good roads and fair legislation, such additional members not to exceed five in number.

The national convention committee named above will shortly hold a meeting, at which the additional members of the committee for 1909 will be appointed. Other organizations having the same objects in view are expected to name representatives, who will then be added to the executive committee. Some idea of the national character of the convention may be gained from the fact that there were present 229 accredited delegates, including representatives nominated by the governors of 20 States, and others from about 60 clubs of the A. A. A. Eleven States and the province of Ontario were represented by their chief highway officials. Also in attendance were former Governor Bachelder, the Master of the National Grange; State Masters Derthick, of Ohio, and Godfrey, of New York, and J. E. MacDonald, J. W. Hunter and E. L. Powers, respectively president, vice-president, and secretary of the American Roadmakers' association.

The proceedings of the convention are now being compiled and printed, and will shortly be distributed throughout the country.

WHY THE RECOGNIZED CLUBS CANNOT RECOGNIZE THE A. A. A.

PARIS, July 15.—Apparently there is one insurmontable present reason why the International Association of Recognized Automobile Clubs could not, even if it so desired and found advisable, place on its membership list the American Automobile Association as the successor of the Automobile Club of America. The present constitution of the international body of clubs provides that only one club can have membership from a country, and no provision whatever is made for an association of clubs from a country, and 'tis a hard task to amend constitutions.

This situation was made very clear to the foreign relations committee of the A. A. A. at Dieppe, though it should be repeated again that this committee made no effort whatever to obtain at this time any membership in the international association, contenting themselves with making known the fact that it was the A. A. A. which had and did control racing.

Though the delegates of the recognized clubs now have a fairly comprehensive and correct idea of the situation in America, not a few of them are embarrassed with the probability

that the American situation may duplicate itself in their own countries; in fact, such actually is the case in Great Britain, where the Royal Automobile Club is finding itself most stubbornly opposed by the Motor Union of Great Britain and Ireland, which body seems to be getting much the better of the waging controversy. In Germany, the Imperial Automobile Club is having some difficulty in retaining its club aristocracy, and while temporarily the Automobile Club of Italy seems to be in the ascendency, there is likely to be a renewal of a troubled situation in that country.

Therefore, it is plainly apparent that in insisting upon recognizing the Automobile Club of America as the seat of government in America, though it has as yet no racing to govern, the recognized clubs come pretty close to "saving their own faces" by preventing the spreading of the idea that all of the clubs of a country, through national officers of their own sclection, should figure in the international congress.

While the recognized automobile clubs profess to concern themselves with other affairs than racing, it is an established fact that its other activities are minor in character and frequently—especially in the matter of touring—is excelled by similar work of other organizations. For instance, in France one finds the Touring Club of France the best source for information of this sort, and in England both the Motor Union and the Automobile Association meet the necessities more satisfactorily than the Royal Automobile Club. Also in Italy, the touring club of that country duplicates the work of the French organization.

There being only one speed contest of real international importance—that of the Grand Prix of France—the Automobile Club of France practically dominates the racing situation, and such domination finally reduces itself to the Sporting Commission of the Automobile Club of France, and its most forcible and sometimes stubborn chairman is Rene de Kynff, managing director of an automobile company. The majority of the Sporting Commission being composed of French manufacturers, it is a natural and expected sequence that the racing interests of France are first considered in the international rules.

The impression that exists on this side is that the American manufacturers will never succeed in winning the Grand Prix and that they are wasting their money in the attempt. Furthermore, the French makers intend to discontinue racing in America as soon as they do not sell enough cars in that country to commensurate them for the heavy expenses. Just at the present time it is not so much a question of New York or Savannah, but a question as to whether they will participate at all. If they do participate, it is the privately expressed belief that they will not permit the Vanderbilt Cup race to be neglected, even though their entries will be made in a roundabout way.

NEW JERSEY'S BIG CLUB BELIEVES IN WORTH OF ORGANIZATION

NEWARK, N. J., July 18.—That the Associated Automobile Clubs of New Jersey should take on a new lease of life and become a most powerful factor in ameliorating automobile conditions throughout the State, is the opinion of the New Jersey Automobile and Motor Club, the largest club in the State. Various rumors have been set afloat recently, apparently for various reasons, and, in order that there could be no misunderstanding of the exact situation in New Jersey, a meeting of the trustees of the New Jersey Automobile and Motor Club was called for Thursday night, when these resolutions were adopted:

Whereas, Statements have recently appeared in the press representing that the New Jersey Automobile and Motor Club was about to sever its relations with the Associated Automobile Clubs of New Jersey and also its relations with the American Automobile Association, and

Whereas, Statements have also appeared that this club was not in accord with the policy of the Associated Automobile Clubs of New Jersey in testing the constitutionality of the law; therefore be it resolved:

First—That this club is and always has been loyal to the Associated Automobile Clubs of New Jersey and expects to remain so, believing that the fundamental principle of organization is absolutely necessary for the success of all undertakings.

Second—That this club is in hearty accord with the management of the American Automobile Association and has no intention whatever of severing its relations with the association, but desires to cooperate with it in its efforts to better automobilists and automobile interests.

Third—That this board is in hearty accord with the proposed suit to test the consttutionality of the law, and to subscribe its necessary pro rata share of the expense of same in compliance with the wishes of the members of the club as expressed by a resolution unanimously passed at the annual meeting of the club on May 4.

Fourth—That copies of these resolutions be sent to the secretaries of the American Automobile Association and the Associated Automobile Clubs of New Jersey, and to the Press.

It is understood that the New Jersey club intends to concern itself immediately with increasing the efficiency of the State body, and plans are under way for a convention of all road users at Atlantic City, the result of which should be a better understanding between the automobilists and the farmers and all others who use the excellent roads of the State.

The Newark *Star* prints the following in its report of the New Jersey club's meeting: "As far as any stories of the local club resigning from the American Automobile Association are concerned, that subject has never been hinted at in New Jersey papers, and was suggested by the automobile man of a New York paper who found news dull one day last week. His article was widely copied until it grew from a suggestion into an absolute statement. The feeling between the Jersey club and the A. A. A. has always been cordial, and whatever friction there has been in the case of the New Jerrsey federation has arisen principally because the members of the Newark club failed to get the membership cards in the A. A. A. to which they were entitled. This matter has been amicably settled."

CHICAGO'S BID FOR THOMPSON CUP STOCK CAR RACE

CHICAGO, July 20.—The announcement that the Chicago Automobile Club wants the Thompson stock car race of the American Automobile Association has aroused a great deal of interest in automobiling circles in this part of the country, particularly as the club's application for the big event was preceded by a painstaking investigation of an available course by Chairman J. F. Gunther, of the racing board of the club. When President Hotchkiss of the A. A. A. was in Chicago attending the Republican convention, his conversation with the directors of the club led them to believe that an application for the event might receive favorable consideration, if backed up by a suitable course and military protection which appear to be forthcoming.

The projected course is in Indiana not far from Chicago, and is a 22-mile circuit without a railroad crossing on it and with but two small towns, through one of which at least no control would be necessary. There are 11 turns in all, some of them sharp, while the straightaway stretches are long and fast. With the exception of three miles, the course is an 18-foot strip of good macadam and the break in question is now in course of construction. On the tour of inspection, A. J. Banta's Locomobile roadster made 65 miles an hour on the straightaway with five people up, which gives some idea of the speediness of the course. One great disadvantage, however, lies in the necessity of establishing a control through Lowell, Ind.

GRAND PRIX WINNER TO COMPETE IN VANDERBILT RACE

PARIS, July 18.—The purchase by Robert Graves of Lautenschlager's winning Mercedes insures the appearance of the speedy German victor of the Dieppe circuit in the coming Vanderbilt race on Long Island next fall. Mr. Graves is a member of the Vanderbilt Cup commission, as well as of the Racing Board of the American Automobile Association, and constitutes one of the foreign relations committee of the A. A. A., which was appointed some weeks ago. He has already entered a Mercedes car in the Vanderbilt race this year, nominating the car which took part in the race of 1906 over the Nassau County course. His purchase of the new Mercedes which performed so well in the French race may mean that he intends to enter a second car in the Vanderbilt, or that he intends this recent acquisition to take the place of the older car previously nominated, but at all events it is certain that the Grand Prix winner will figure in the event to be held over the Long Island Parkway course, part of which is now being rushed to completion for this purpose and will shortly be ready for trials.

Just who will handle the wheel of Mr. Graves' most recent addition to his stud of racing cars when it lines up before the starter next fall is at present uncertain, but, figuring from past precedent, it is quite likely that he will bring over one of the Continental racing cracks, and it is not at all improbable that this may be Lautenschlager himself. In previous events, Mr. Graves has retained Jenatzy, and the red-bearded Teutonic Mephistopheles has become a familiar hero on the Long Island course. That driver is now a Mors pilot.

The Mercedes racer which figured so prominently in the Grand Prix is rated at 120-horsepower, and is a specially designed racing car that embodies numerous departures from the standard construction of the German factory. The four cylinders are cast in pairs as usual, but they have been designed with domed heads and have the valves placed in the head, thus following a design which has come to be accepted as making for the very highest efficiency. The cylinder dimensions are 155 mm. bore by 170 mm. stroke, or the equivalent of 6.09 inches by 6.68 inches. A honeycomb radiator is employed in connection with a centrifugal pump for circulating the cooling water, while a Bosch high-tension magneto constitutes the ignition system. The first step in the transmission of the power consists of a Lindsay spiral spring clutch, while the gear-set provides four forward speeds and is built with three shafts. Final drive is by means of double side chains. The wheelbase is 106.25 inches, while the tread is slightly less than the American standard.

FARMAN COMING WITH HIS AEROPLANE.

Henri Farman, the French aviator, is now on his way to this country to give a series of public exhibitions at the Brighton Beach race track, which a syndicate in conjunction with the Aero Club of America arranged for recently. The aeroplane left Antwerp last Friday on the *Kroonland*. M. Farman was to sail from Havre on the same day, but at the last moment, with characteristic prudence, he refused to start unless a guarantee of 30,000 francs was made him. This was satisfactorily arranged, and the aviator left according to schedule on the *Touraine*. Thomas R. McMechen, a member of the syndicate, after receiving a cablegram from F. S. Lahm, the foreign representative of the club, stated that he was now assured that the exhibition flights would begin as planned on July 29.

THAT TOLL BRIDGE ACROSS THE CONNECTICUT.

HARTFORD, CONN., July 20.—The Warehouse Point, Windsor Locks, toll bridge has been thrown open as a free bridge, and hundreds of motorists who have been well "stung" for excessive bridge tolls in the past will rejoice at the new turn of affairs. About 20,000 people participated in the celebration at Windsor Locks, Saturday afternoon and evening. Heavy electrical storms prevailed more or less throughout the day, but this did not interfere to any extent with the program. Members of the Hartford and Springfield clubs were present and took part.

NO MUFFLER CUT-OUTS IN NEW YORK.

According to Police Commissioner Bingham of New York City, the muffler cut-outs on automobiles and motorcycles come in the same class as whistles on peanut roasters, ringing of bells by scissors-grinders, and the yelling of "old clothes" men. The nine thousand policemen of Greater New York have instructions to remonstrate gently but firmly with any inconsiderate chauffeur who thus offends the public ear. The ban is also placed on all unnecessary blowing of horns and sirens. Chauffeurs who return to the garage at 2 A.M. must now arouse the watchman in the orthodox way, instead of serenading the whole neighborhood until they gain admittance.

EXCESS LICENSE MONEY FOR GOOD ROADS.

LANSING, MICH., July 20.—Michigan's State Highway Commissioner, familiarly known as "Good Roads Earle," will receive $12,000, collected by the Secretary of State for automobile licenses, over and above the cost of running the license department, to be used in the still further betterment of the highways in the State. Great things are expected from the use of this fund, as it is to be used not for the actual building of roads, but for the expenses of the men who are to be sent to the counties in the State in which the "county good roads system" has not been adopted as yet, on an educational tour to show the farmers the meaning of good roads to them.

HOOSIERS ARE AFTER ROADS AND GETTING 'EM

INDIANAPOLIS, IND., July 20.—The United States Government is doing more to extend good roads work in Indiana than all other associations combined. Estimates of $8,000,000 for road building in Indiana this year will probably be insufficient, for the amount to be expended will probably reach a larger sum.

Before the advent of rural routes, the farmer was more or less indifferent about the condition of the roads. In the last few years, however, he has been buying automobiles and has grown accustomed to having the mail left almost at his door. Recently, however, the Government, through its postal authorities, have been demanding vigorously that roads shall be improved still more. In the vicinity of Charlestown the entire rural mail service threatens to be discontinued because of bad roads and farmers are now projecting the building of forty-one new roads.

In other parts of the State officials and business men are hurrying through road improvements to save rural routes. Madison County is preparing to build twenty-one new roads at a cost of $250,000. At South Bend the Business Men's Association is making special efforts to have good roads built. A few days ago township trustees and road supervisors of three counties met at Peru to discuss good roads. George Allen was elected president and C. F. Davis secretary of a good roads body.

MIDSUMMER DOINGS OF THE AUTO CLUBS

SYRACUSE CLUB IS ACTIVE IN SIGN WORK.

SYRACUSE, N. Y., July 20.—During the past year, the Automobile Club of Syracuse has made an excellent gain in membership, its roster now containing 175 names, which means that it has practically doubled in strength within the past two years. Secretary Forman Wilkinson is about to launch a campaign to recruit the one hundred odd autoists of the city who are not at present affiliated with the club, for to quote him, "They need us as much as we need them." The organization is carrying out so much good work that every progressive autoist should lend it his financial as well as moral support, for every owner of an automobile within a radius of more than 50 miles benefits directly by the club's efforts for better conditions. It is estimated that the number of cars in Syracuse has grown by 50 per cent. within the last year, now totaling something like 350.

A great amount of work has been carried out this summer in placing route and danger signs, the Syracuse club being a pioneer organization in the provision of railway crossing signs. No less than 150 signs of various kinds have been placed in Onondaga county alone this summer and specifications have already been drawn for an additional lot of 75 to be placed in various small towns in this district. The Empire State is sadly deficient in these signs and the Syracuse club is setting an excellent example.

BOROUGH OFFICIALS IN PENN. TRY SPEEDS.

MEDIA, PA., July 20.—Last week several members of the Automobile Club of Delaware county gave President Samuel A. Field, of the borough council, and four other councilmen, a practical demonstration of the meaning of the various speed limits as applied to an automobile. Beginning with the legal borough limit of 10 miles an hour, which was characterized by the solons as a "snail's pace," the driver "hit it up" to 20 per, and showed how the car could be stopped within its own length while traveling at that gait. Then the borough fathers were taken to the Springhaven Country Club, the odometer showing a 40-mile clip at times. The lawmakers were charmed with the performance, especially when the car was brought to a dead stop in 25 feet while traveling at the last-named speed.

The club is doing excellent work in keeping the speed within the limits, all of the members having subscribed to the "honor" plan, agreeing to at all times observe the State and borough regulations. The club has two paid agents constantly on the road warning automobilists against overspeeding. Signs have been posted on the most tempting stretches bearing the legend: "No scorching or speeding through the boroughs."

As a result of the *entente cordiale* between the authorities and the club, Media is becoming a veritable automobile heaven, and the latter can have anything within reason that they want. Appeals for road repairs are responded to instanter, not alone in tbe boroughs but in the surrounding townships.

HARTFORD AUTOMOBILE CLUB IS GROWING.

HARTFORD, CONN., July 13.—The Automobile Club of Hartford continues to expand. Several of the members favor consolidation with the Hartford Yacht Club, making it possible to have a rendezvous at Fenwick, the Sound station of the yacht club. The growth of the club in the past nine months is remarkable. It is quite likely that the 300 mark will soon be reached. A clubhouse is talked of, though that cannot come for a while as yet. The present quarters in the Allyn House have proven very popular and useful for transient motorists who desire some authentic information concerning roads.

The newly formed Automobile Club of Willimantic, near here, is in a prosperous condition, and the membership is gradually increasing. Needless to say, the gain of any individual club means a gain for the Connecticut Association, and this is much desired in order that its scope of influence may be extended.

ANOTHER CUP FOR CONNECTICUT BODY.

TORRINGTON, CONN., July 20.—Twenty-five enthusiastic automobilists of this town met recently to organize the Litchfield County Automobile Club, of Torrington. John N. Brooks was chosen chairman of the meeting, and N. D. Holbrook, secretary. Mr. Brooks briefly outlined the purposes of the club, and later Mr. Holbrook read a communication from E. K. Dustin, secretary of the Connecticut Automobile Association, showing the objects of that organization and what its benefits were. The following officers for the ensuing year were elected unanimously: President, N. D. Holbrook; vice-president, John N. Brooks; secretary, W. P. Norton, Jr.; treasurer, George E. Cole. There will also be four standing committees on good roads, sign posts, membership and rights and privileges. The chairmen of these committees, who, according to the by-laws, was appointed by the president, are F. P. Latimer, J. H. Baeder, F. W. Mertz and Dr. Elias Pratt, respectively. Together with the four officers, they will form the governing board and will have the right to select the other two members of eacb committee.

There are said to be over seventy automobiles owned in Torrington and almost as many more in the surrounding towns. Efforts will be made to persuade all owners in the vicinity to join the club, which will then be affiliated with the Connecticut Automobile Association. The club will also attempt to get rid of several dangerous "thank you marm's" and grade crossings. The next meeting will be held about the first of August.

PENN. LAWMAKERS AND AUTOISTS IN HARMONY.

PHILADELPHIA, July 20.—The "honor" plan of solving the speeding problem in the townships and boroughs roundabout this city gives evidence of proving much more satisfactory than the "iron glove" method. The scheme was first inaugurated in this section by the Norristown club, when the members obligated themselves to faithfully observe all regulations at all times, and to do their utmost to induce others to do likewise, and, failing this, to assist in the prosecution of those who persistently violate the laws. The result has been a separation of the sheep—the club members—from the goats—the "unattached." It has been demonstrated that fully 80 per cent. of the convictions for speeding have been among non-club members.

In the smaller towns especially the scheme is working well. In Lancaster, Norristown, Media, and other places hold-ups by the authorities have become a variety, and in the majority of instances where a motorist is stopped it is found that he is some unattached wight who feels that he is not obligated by any action a club of which he is not a member may take; or else he is a stranger in the land, and is not "wise" to the existing conditions. In the latter case the culprit is usually let off with a reprimand; in the former he gets the limit.

That these "brotherly love" conditions do not obtain in all sections of the country hereabouts is evident from the weekly warning bulletin of the Automobile Club of Philadelphia, which calls attention to traps on the smooth roads between Hulmeville and Oxford Valley and between the latter place and Langhorne. To offset the efforts of the officers, the club has stationed men 100 yards above and below these traps, and will keep them there until the traps are abandoned. If established elsewhere, the club's watchers will follow them, and continue their warnings until the traps are finally abandoned.

AKRON CLUB IN OHIO'S ROAD CAMPAIGN.

AKRON, O., June 23.—The Akron Automobile Club has taken steps to bring about the construction of a paved road from Akron to Cleveland, a distance of 32 miles. The movement is in response to the efforts of the State Automobile Association to have the motorists of this section unite in the general good roads movement now sweeping the State. A paved roadway already exists to Brecksville, some nine miles south of Cleveland.

THE WINNERS IN THE WINTON CHAUFFEURS' CONTEST

THE winners in the $2,500 contest for Winton Six chauffeurs have just been announced and the prizes distributed. First prize was taken by Frank Schneider, driving for Milton Schnaier, of New York, with a record of 11,683 miles in seven months at a total repair expense of $12. The judges were E. E. Schwarzkopf, A. C. Faeh, St. Clair Couzens and M. M. Maxwell. Their decisions were based on monthly reports from the chauffeurs, certified by the owners, and final affidavits from both chauffeurs and owners. Schneider's expense of $12 was not incurred until after his car had run 8,000 miles, and as no other contestant had reached this figure without expense, the judges were unanimous in awarding him first prize.

Second prize goes to Arthur Donovan, chauffeur for J. Axelrod, of New York, who reported a mileage of 7,570, with no upkeep expense.

Harry A. Toomey, of Euclid, O., driving for Harry S. Pickands, won third prize on a mileage of 6,632.9, with no expense. Toomey's original report showed an expense of $284.85, but as this was caused by an accident while the wife of his employer was driving the car, the judges held that it should not be charged against him.

There were ten prizes, ranging from $1,000 to $100. All contestants who drove their cars more than 3,000 miles were awarded handsome gold watches, suitably engraved. It is noteworthy that six of the ten cars finished without any repair expense whatever. This is quite a feather in the cap of the Winton Company, and also shows the importance of having some incentive for the chauffeurs to take proper care of their cars. Such contests teach owners what they may expect in the way of economical upkeep, and should have the effect of making them less lenient in their review of the monthly garage bills, which so frequently contain numerous unwarranted items.

Frank Schneider, Winton Contest Winner, and His Car.

The Winton Company announces that this contest will be repeated in 1909, conditions to be announced later. The table which is appended furnishes the data of the ten prize winners:

Prize.	Amount.	Chauffeur.	Owner.	Residence.	Mileage.	Time.	Average per Mo.	Expense.
First	$1,000	Frank Schneider	Milton Schnaier	New York, N. Y.	11,683	7 months.	1,669 miles.	$12.00
Second	500	A. J. Donovan	J. Axelrod	New York, N. Y.	7,570	3.5 months.	2,162.8 miles.	none.
Third	250	Harry A. Toomey	Harry S. Pickands	Euclid, O.	6,632.9	10 months.	663.3 miles.	none.
Fourth	150	Chas. L. Bonner	Jas. T. Brennan	Brooklyn, N. Y.	6,806	8 months.	850.7 miles.	$3.00
Fifth	100	James Boice	Warren Somers	Atlantic City, N. J.	6,183	7 months.	883.3 miles.	$0.02 1-2
Sixth	100	A. R. Cowperthwaite	Mrs. L. R. Speare	Newton Center, Mass.	6,113.6	4.5 months.	1,358.5 miles.	none.
Seventh	100	Joseph Arnold	Joseph Fish	Chicago, Ill.	5,535	6 months.	922.5 miles.	none.
Eighth	100	James Townsend	H. H. Roelofs	Elkins Park, Pa.	5,415	6.3 months.	856.4 miles.	none.
Ninth	100	G. W. Butler	J. E. Cienny		5,155	3.2 months.	1,628.2 miles.	none.
Tenth	100	E. C. Knapp	E. A. Rooney	Buffalo, N. Y.	4,597	5.5 months.	835.3 miles.	$0.10

Summary.—Ten cars ran 65,687.5 miles in 61 months, averaging 1,076.8 miles per month per car. Repair expense, $15.12 1-2, averaging $1.51 per car; or 25 cents per month per car.

A. L. A. M. TAKES IN A NEW MEMBER.

For the first time in two years the Association of Licensed Automobile Manufacturers has admitted a new member. This was the Chalmers-Detroit Company (formerly the E. R. Thomas-Detroit Company), which was taken in at the meeting on July 17. This action was expected by many, as the Chalmers-Detroit Company had been selling their cars under the license of the E. R. Thomas Motor Company, of Buffalo. The license now granted is an independent one and places it on the same footing as the original members of the Association. The admittance of this company is announced to be mutually advantageous, as the Association will now have in its ranks another low-priced car, the lack of which has long been felt. This action is said to indicate the general policy which the Association intends to carry out, and it is believed to be the first move in a campaign of enlargement.

Roy D. Chapin, the treasurer and general manager of the Chalmers-Detroit Company, was very much pleased by the attitude of the association, and values highly the advantages which will accrue to his company through the new arrangement. The Chalmers-Detroit car will be sold by the licensed automobile dealers throughout the United States, and will exhibit at the Madison Square Garden show to be held next January. Mr. Chapin is very optimistic for next year's outlook.

BARTHOLOMEW 1908 OUTPUT COMPLETED.

PEORIA, ILL., July 20.—The last of two hundred Glide cars, the Bartholomew Company's product for 1908, was completed to-day. Plans are now being made for the season of 1909, and it is the company's intention to market a still larger number of cars than this year. They will continue to use the Rutenber motor, made by the Western Motor Company, of Logansport, Ind. There will be but one model, styled the Model "G" Special. It will have 4 3-4x5-inch motor, with magneto ignition, with a wheelbase of 120 inches, and in its general lines will follow the 1908 model. A roadster will also be built on the same design, except that the wheelbase will be 106 inches, and the steering post will be given a greater rake. This car will be furnished with two types of bodies, one with a collapsible double rumble seat, and the other with a close-coupled design.

On account of the constantly increasing Eastern trade, O. Y. Bartholomew, the present treasurer of the company, has been appointed Eastern manager. He will assume his new duties August 1, with headquarters at Philadelphia. With his personal attention and supervision it is believed business in that section will show a still added increase, as, up to the present, the company has not been in a position to devote the measure of attention to the Eastern trade that the demand for the Glide merited during the past three or four years.

Holsman Model 4—The Latest High Wheeler.

NEW MODEL HOLSMAN MAKES ITS DEBUT.

In order to bring out a car within reach of a much greater number of people, the builders of the Holsman, the Holsman Automobile Company, 444 Monadnock Block, Chicago, have modified the lines of their standard machine and while still maintaining the same design and constructional features throughout, as well as the same grade of materials, have produced what is officially known as the Model No. 4 Holsman runabout. The same power plant is employed as in the high-priced machines, and in many ways it is identical with them; the same high-grade forgings, castings, seamless steel tubing are used throughout. The wheelbase is 65 inches, while any tread from 52 to 62 inches is optional with the purchaser, the car weighing 800 pounds all on. It has a gasoline capacity of 5 1-2 gallons, on which it can cover 150 miles, and is equipped with solid rubber tires on the usual high wheels. In complete running order it lists at $550, the top and side lamps being extra.

Some idea of its appearance may be gained from the photograph of the first one of the new series in the Holsman fold, that tops the head of this column. It is there shown in complete running order, minus head or side lights.

A NEW CAR FOR 1909—THE WOODS.

Walter A. Woods, the general manager and treasurer of the Cleveland Motor Car Company, has resigned his position in that company and will now be at the head of a new concern located in Milwaukee, Wis. A six-story building now under construction on "automobile row" in New York City will be occupied by the new company as their headquarters and will be opened about September 1. Temporary offices have been secured in the Miller building, 1931 Broadway, New York City.

The new car will be of the four-cylinder type of five-inch bore and stroke, and will have double ignition with high-tension magneto and the now popular self-contained oiling system. The change-gear will be of the selective type, four seeeds forward and one reverse, with direct drive on the third speed. The clutch will be the improved Woods design multiple disc, containing 52 metal plates or discs running in oil and inclosed in a separate case. A new feature of this clutch is a form of brake which absolutely prevents the discs from turning while shifting gears, rendering this operation entirely noiseless and eliminating one of the principal objections to this type. The wheelbase will be 122 inches for touring cars, limousines and landaulets, and 112 inches for runabouts, toy tonneaus and town cars. Fully equipped with top, slip covers and glass front, the car will sell for $3,500.

Work on the 1909 product has already been begun, and deliveries will start on or about October 1. The new car will be known as the Woodsmobile, thus identifying it with the founder of the company, who for the past 15 years has been actively identified with the industry.

A. M. C. M. A. MEMBERSHIP ON THE INCREASE.

During the past week three more automobile manufacturing concerns have been admitted to membership in the American Motor Car Manufacturers' Association. They are as follows:,

Holsman Automobile Company, Chicago, Ill.

W. H. Kiblinger Company, Auburn, Ind.

Midland Motor Car Company, Moline, Ills.

The first two are well known as producers of the high-wheeled buggy type of car, of which such a large number are now in use in the West, while the Midland is a touring car of standard construction which is now being turned out by the new company which took over the plant of the former Deere-Clark Company.

MEMPHIS WILL HOLD GOOD ROADS CONVENTION.

MEMPHIS, TENN., July 20.—Draining the swamps and improving the roadways of the lower Mississippi are subjects to be discussed by a convention to assemble here July 27.

In this section of the country swamp drainage is imperative, from a national as well as a territorial standpoint, and the accomplishment will materially lessen the good roads problem now confronting this State. Memphis needs good roads—north, south, east and west—and it is hoped that by concerted effort at the coming convention much may be accomplished.

The automobilists here—500 of them—are not organized. As individuals they are all interested in this movement, but lacking an organization they cannot throw their combined strength in favor of good roads at the meeting.

CONVENTION OF MAXWELL DEALERS.

The main office of the Maxwell-Briscoe Motor Company at Tarrytown, N. Y., was a busy place last week on account of the annual convention of the company's branch-house managers. The first day's session was devoted to reports on business conditions throughout the country; Tuesday the guests went on a "rubberneck" tour through New York, dining that evening at the Café Martin. In a business session following the dinner Mr. Briscoe divulged part of his new selling plan, which he believes will revolutionize the methods of selling automobiles in this contry.

Among those present at the banquet were Benjamin Briscoe, J. D. Maxwell, W. S. Hathaway, New York; P. Chiera, Detroit; T. B. Smith, Chicago; J. W. Willcox, Los Angeles; J. C. Handley, Dallas, Texas; C. G. Bleasdale, Cleveland; C. F. Benzing, Buffalo; C. F. Monroe, Buffalo; T. F. Dunn, Pittsburg; F. J. Tyler, Boston; C. W. Kelsey, Philadelphia; A. R. Gormully, Tarrytown, N. Y.; J. M. Austin, Atlanta, Ga.; E. W. Davenport, Col. K. C. Pardee, and R. Irvin, New York City; F. D. Dorman, Tarrytown, N. Y.; L. W. Hazard, High Point, N. C.; A. I. McLeod, Detroit; F. J. Linz, San Francisco; Ernest Coler, Dobbs Ferry, N. Y.

Maxwell Branch Managers at Their Annual Convention.

NEW MICHELIN DISMOUNTABLE RIM.

Since the first dismountable racing rims came into use for the French Grand Prix of 1906, a few changes have been made in the details of these time savers, but the principle of such well-known makes as Michelin, Continental and Vinet has remained unchanged. As is generally well known, eight or more nuts have to be withdrawn and put into place again in the operation of changing a tire. When a revolver brace, such as is supplied with the Michelin rim, is employed, the operation is not a long one, it being possible to make a change, even under ordinary touring conditions, in the short interval of two minutes.

But two minutes is a long time with automobile races as keenly disputed as they are at present, and the Michelin people have sought to reduce the time to a considerable extent. The new rim, after undergoing long private tests, has been supplied to drivers in the Grand Prix, and will make its first public appearance on July 7 at Dieppe. Instead of eight bolts, there is now one fastening only, and no part whatever other than the rim to be taken off in making a change. With this improved type it is possible for a race driver to change a tire in 30 seconds, as we have proved under actual conditions.

The fixed rim, instead of having the inside edge raised and the outside flush, as in the earlier types, has both inner and outer edge beaded. The dismountable rim bearing the inflated

Single Fastener of the New Michelin Rim.

tire is split, and when in its open position leaves a gap of about three-quarters of an inch. The gap in the face of the rim is covered over by an internal brass lining, the main object of which is to prevent the nipping of the tube when the rim is closed up.

The two ends of the detachable rim are connected by a right and left screw fitting into a steel case riveted to each extremity of the rim. The central portion of the screw bears a worn gear operated by a small pinion within the casing shown in illustration, by the operation of which the two ends are brought together, this contraction being sufficient to bind the dismountable rim on the fixed rim. Immediately above the worm gear is a longitudinal pointer, the object of which is to show what degree of opening or closing has been obtained.

The fixed rim and felloe have had to be cut in order to accommodate the projecting lugs and the worm gearing. The hole goes right through the wooden felloe, but all the moving parts are protected by a sheet metal casing on the inner face of the felloe. Naturally, the outer face of the felloe has had to be pierced also to allow of the insertion of the square-ended bit which operated the gear. This opening is protected by a hinged metal cover, so that when the rim is in position it is impossible for either dust or moisture to settle on the threads or to reach the bearing surfaces of the rim.

The maximum expansion of the rim is just sufficient to allow it to be fitted over the outer edge of the fixed rim. In addition to contracting the rim, the turnbuckle prevents creeping, the opening made on the wooden felloe being just sufficient to

New Dismountable as It Appears on the Wheel.

accommodate the projecting portions. Instead of spaced bearing points as on the earlier type of rim, the two surfaces are in complete contact for their entire circumference, this arrangement considerably increasing the strength of the wheel, which is now completely bound. An ordinary type of long valve is employed, and the usual style of lugs with the short countersunk stems familiar to all users of dismountable rims.

Private tests which have been carried out by the Michelin factory for several months have shown that the rim was fully as strong as the earlier models; the ease of changing is obviously very much greater. It is with full confidence that it is safe and a time saver that it has been offered to all drivers of cars fitted with Michelin tires in the Grand Prix race. The new device will be used for the first time among others by Lewis Strang, the pilot of the American Thomas in the Grand Prix.

INDESTRUCTIBLE WHEELS FOR MOTORCYCLES.

It is evident from the illustration, picturing an Armac motorcycle equipped with Indestructible steel wheels of the type made especially for automobiles, that there is an unlimited field for the application of wheels of this kind for service where the wood or wire-spoked wheel has been universally used up to the present. For motorcycle use, the Indestructible wheels are equipped with Eclipse hubs, and, according to the manufacturers, the Indestructible Steel Wheel Company, 1211 Michigan avenue, Chicago, they have many advantages over the wire wheel ordinarily employed for this purpose. They are not only much stronger and more durable, but their enameled finish is also much more lasting than nickel plating. They are as resilient as a wire wheel and cannot get out of true, while there is no danger whatever of their collapsing, or of obstructions getting through them. Protection is also afforded for the tire valve, and means are provided for locking the valve nuts, so that the tire is prevented from creeping on the rim, even under the most strenuous conditions of high speed traveling over any kind of roads. Their ability to withstand treatment that would ruin a wire wheel should recommend them to motorcyclists.

Motorcycle with Indestructible Steel Wheels.

How the Supply of Fuel Is Assured on Hills.

RAMBLER SUPPLEMENTARY GASOLINE TANK.

Although every automobile manufacturer that has been building cars for any number of years has long since reached a standard of construction for his product that is consistently adhered to, there is always room for improvement in detail. Thomas B. Jeffery & Company, Kenosha, Wis., have found this to be the case, the latest refinement they have added to the Rambler being an auxiliary gasoline tank to insure a supply to the carbureter on hills, particularly where the latter are long, stiff grades. This new auxiliary tank, as shown by the accompanying photograph of a Rambler power-plant that has been fitted with it, is located above and behind the carbureter, and considerably below the level of the main tank. It has sufficient capacity to run the car for several miles on an upgrade and is so arranged that the gasoline will flow into it from the main supply on a level or a slight upgrade, but it cannot empty back into the main supply under any conditions of running. It measures 4 inches in diameter by 10 inches in length.

ONE OF THE MANY RAMBLERS IN MEXICO.

Mexico is proving quite a field for the American manufacturer to develop, as is already evidenced by the rapidly increasing number of cars of well-known makes that hail from across the border as compared with those brought from Europe. The foreign manufacturer has been more progressive in past years in introducing his product to this market, but within the last twelve-month American makers have gained a great deal of lost ground and are now making rapid strides, the winning of the first Mexican road race for the Jalisco cup by an American car over its high-powered foreign rivals showing that American automobiles are built for the roughest kind of roads to be found.

A Native Driver of a Rambler in Mexico.

MAY SHOWS A FALLING OFF IN EXPORTS.

According to the report of the Department of Commerce and Labor for the month of May last, there has been a considerable falling off in the value of the American automobiles and parts sent abroad, as compared with the same month of a year previous. This is principally to be accounted for by the fact that there has been a heavy cut in the English demand as shown by the difference in the figures for the United Kingdom during the two months in question. It is somewhat anomalous to note in the same connection that the American exports to France increased from $85,984 to $100,597 during May, 1908, as compared with May, 1907, while the returns for Germany and other Europe also show substantial increases. For the period of 11 months ending with May in the past three years, the totals are for 1906, $2.957,748; 1907, $4,770,187; and 1908, $4,567,125.

LOGAN SIGHT-SEEING CAR IN COLUMBUS.

During the past year or so one of the most prominent features of the demand for commercial vehicles has been the great number ordered for sight-seeing service. The Logan Construction Company, Chillicothe, O., have found this to be the case with their three-ton Model S chassis, which makes an excellent car of this type, as will be evident by the accompanying photograph of one of them that has just been supplied for service in Columbus, O. There are six seats back of the driver's, each of which is 6 feet wide and is designed to accommodate five persons. The tire equipment consists of 36 by 5-inch solids front and 36 by 3 1-2-inch twin tires on the driving wheels. Steering is made easy by the use of Timken roller-bearings in the steering knuckles. The gears of the change-speed gear-set are all of Krupp chrome-nickel steel, while the shafts are vanadium steel. The car shown was run from Chillicothe to Columbus, a distance of fifty-one miles, in about five hours. It is designed for a maximum speed of twelve miles an hour, but the roads were not in shape to permit of this.

Logan Truck Built for the "Rubberneck" Business.

STANLEY STEAMERS QUIT RACING.

Announcement was made yesterday by W. J. Morgan, secretary to the trustees controlling the Sir Thomas Dewar international mile trophy, that the Stanley Motor Carriage Company had returned the cup with the statement that they were out of racing. The contest for the trophy was not held at the Ormond-Daytona meet this year, as usual, because the rules adopted by the trustees were at variance with those established by the A. C. A. There was some talk of a match between the twelve-cylinder Maxwell racing car and the Stanley, but that, of course, will not now take place. It is possible, however, that a race for the trophy may be held some time this summer, if a fast mile straightaway course can be secured.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

Otto Holler, manager of the Paul Thomann Machine Company, Duesseldorf, Germany, Hansahaus No. 155, is interested in the representation of a small and cheap automobile for business and touring purposes, and will be glad to have catalogues and all particulars from prominent American firms.

Owing to a transposition in make-up in last week's issue of THE AUTOMOBILE, on page 99, the P. & S. Skimabout was given second place in the summary of the Arrowhead hill-climb, in the $1,251 to $2,000 class. The P. & S. Skimabout won the contest, and its time was :294-5; not :494-5, as printed.

E. R. Stockwell, Mechanicsburg, O., agent for the Reliable Dayton, accompanied by W. E. Sanger, also of that city, drove a Reliable Dayton type "E" to the Chicago factory and return last week, spending two days on the road each way and two days traveling about the vicinity. The total distance covered was 834 miles, an average of 139 miles per day. The longest day's trip was 209 miles.

For several years John D. Rockefeller has owned a White limousine and has taken a daily outing in it, no matter where he was staying. A few days ago he bought another White, but this time with a touring body. The supposition that Mr. Rockefeller intends to do some cross-country touring is strengthened by the fact that he has written to the touring bureau of the White Company asking for a set of White route books and making inquiries about State licenses.

The last car of the Winton Six-Teen-Six output has left the factory, and is now on its way to Wm. R. Hearst. It is fitted with a handsome landaulet body finished in maroon. Delivery was delayed until this time owing to Mr. Hearst's absence in Europe. The Winton factory has been at work for several weeks on the 1909 output, which, as has been already announced, will consist of six-cylinder cars exclusively. Details of the company's plans for 1909 will be announced August 1.

The Ventilated Cushion & Spring Company, Jackson, Mich., through their attorneys, Rummler & Rummler, have just brought an action against Frank D'Arcy, of Kalamazoo, in the United States Circuit Court for the Western District of Michigan, to uphold what is known as the Stott's patent on springs of the type usually employed in automobile work. The special feature of the latter that is covered by the patent in question is an auxiliary or supplementary spring constrution. The suit also protects the rights of the Jackson Cushion Spring Company, as licensees.

When the Y. M. C. A. relay runners carrying Mayor McClellan's message from New York to Chicago reached Syracuse, N. Y., the H. H. Franklin Mfg. Co. loaned three of its motor trucks to carry the spare runners. At 8:15 Thursday evening the silver tube containing the message was passed from the last Rome runner to the first Spracuse boy, in front of the Syracuse Y. M. C. A. The Franklin trucks, loaded with the runners, followed close behind, and at the end of every four minutes, or sooner if necessary, a fresh boy leaped from the truck, grasped the message, and sped on his way. The trucks took the boys as far as Auburn, where the message was delivered to the Y. M. C. A. of that city.

NEW AGENCIES ESTABLISHED.

The Philadelphia agency for the Clammers-Detroit has been placed with the Bergdoll Motor Car Company, Broad and Wood streets, that city.

The Pardee Motor Company, 1229 Michigan avenue, Chicago, has been appointed agents in that city for the Oakland, made by the Oakland Motor Car Company, Pontiac, Mich.

E. P. Moriarty & Company has been appointed agents in Kansas City, Mo., for the new Chalmers--Detroit. It is likely that western Missouri and Kansas will be included in the territory represented.

The Philadelphia Auburn agency, at 441 North Broad street, has just completed arrangements for the establishment of subagencies at Reading and Orwigsburg. The former will be in charge of D. M. Sohl; the latter of R. E. Yeager.

The Morrison & Price Company, Boston agents for the Rainier, Mora and Wayne cars, has just been appointed the representatives at the Hub of the New Everett, to be manufactured by the Verett-Metzger-Flanders Company, of Detroit, Mich.

The White Company has opened a branch office at Minneapolis, in charge of John F. Toole. Mr. Toole states that his company has felt for some time that their line of customers in Minnesota territory were entitled to the service which a branch guarantees. A completely equipped shop in which White mechanics only are employed has been started.

PERSONAL TRADE MENTION.

L. D. Mack has just been transferred from the New York branch house of the Packard company to act as assistant to A. T. Fuller, Boston agent for the Packard.

Arthur Moore, who has been connected with the passenger department of the Erie Railroad, has joined the sales force of the New York City branch of the Firestone Tire & Rubber Company.

Harry Fosdick of the Hol-Tan Company, of New York City, is taking a vacation of several weeks for rest and recreation. Most of it will be spent at Lake Winnepesaukee in New Hampshire.

A. B. Henley, for some time connected with the New York branch of the H. H. Franklin Manufacturing Company, of Syracuse, N. Y., has been made permanent manager of the Franklin branch at Boston.

Former Manager A. J. King, of the Philadelphia Studebaker branch, has joined the selling force of the Quaker City Automobile Company. He will have charge of the Peerless department of the company.

J. C. Zimmerman, for the past two years head of the sales department of the Western branch of the Fisk Rubber Company, of Chicopee Falls, Mass., has just been appointed manager of the Chicago branch of that company.

Walter S. Shawvan, who has been connected with the Chicago branch of the Locomobile Company, has joined the sales force of the Schreiber Motor Car Company, Milwaukee Locomobile agent.

William Stegeman, who has been considered for years by the western motor car makers as one of the prominent factors in the development of automobiles, has just joined the forces of the Palmer & Singer Manufacturing Company as chief engineer.

W. Wayne Davis has been appointed manager of the new branch of the Matheson Motor Car Company which has just been opened at Broad and Green Streets, Philadelphia. Mr. Davis was formerly connected with the Quaker City Automobile Company.

H. E. Butcher, formerly of the H. E. Butcher & Company, manufacturers' agents, with offices in the Stevens building, Detroit, has accepted a position with the Timken Roller Bearing Axle Company as traveling salesman. He will make his headquarters at Detroit.

F. H. Sanders, for several years the Franklin demonstrator and salesman for Adams & Hart, Grand Rapids, Mich., and recognized as one of the best automobile experts and salesmen in that section, has been employed as field salesman for the H. H. Franklin Manufacturing Company.

T. E. Hamilton, who has been acting as sales manager for the H. C. & C. D. Castle Company, Boston, has severed his connection with that concern, and has been appointed New England agent for the Haviland Oil Company. F. B. Armington will be associated with Mr. Hamilton, and they will open up on Boylston street.

A. A. Ledermann, for four years assistant engineer of the George N. Pierce Company, of Buffalo, has resigned his position with that company, to go into business for himself. Under the firm name of the A. A. Ledermann Company he will be located in a new garage at Utica, N. Y., and will have the agency for the Pierce-Arrow in central New York.

Ernest H. Braudt, formerly sales manager for the Corbin Motor Car Company, has been appointed Eastern manager for the Cadillac Company, with headquarters at 1649 Broadway, New York City. The company has taken the Mineola stable, at Columbus Circle, which will be remodeled for their use, and which they intend to occupy about October 1.

George C. Hubbs, for many years advertising manager for the Morgan & Wright Company, Detroit, Mich., has handed in his resignation, to take effect August 1. He will then be associated with the Long-Critchfield advertising agency in Chicago. No successor to Mr. Hubbs will be appointed, as he will continue to look after the Morgan & Wright advertising in his new position.

Charles L. Stevens, formerly manager of the Hartford Suspension Company, has just been appointed the Eastern sales manager of the Midland Motor Company of Moline, Ill., and is now located in New York, making his headquarters at the Allenhurst Garage, the New York home of the Midland. Mr. Stevens has recently been connected with the Matheson Auto Company of Denver.

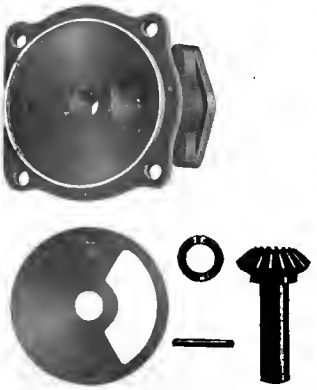
Harry L. Owesney, who has been acting as assistant manager of the San Francisco branch of the Winton Company, has been appointed manager in place of Charles M. Brown, who has taken the management of the New York branch of the company, while W. L. Duck, who was the former London manager of the Winton Motor Carriage Company, has been appointed manager of the Baltimore branch of the company, vice R. L. Williams, who resigned.

INFORMATION FOR AUTO USERS

Willet Motor—This represents a departure from current practice in this country, in that it is a two-cycle type of internal combustion motor fitted with a rotary inlet valve, the latter being water-cooled. It is the product of the Willet Engine and

SECTIONAL VIEW OF WILLET MOTOR.

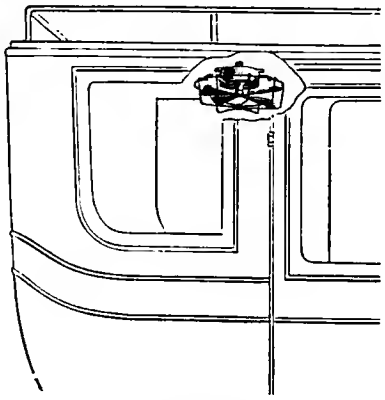
Carbureter Company, 764 Ellicott Square, Buffalo, N. Y. The cylinders are cast in pairs, and are made from the finest grade of gray iron, containing a percentage of Bessemer steel. The exhaust ports are so arranged that there are no sharp turns, thus eliminating any back pressure in the cylinders. The pistons are of the same material, and are fitted with four rings; they are of the Mercedes type, and, owing to their extreme length, they insure long life to the motor. Connecting rods are steel drop-forgings, fitted with cast-iron



DETAILS WILLET ROTARY VALVE.

bushings on the piston pin and interchangeable nickel babbitt bearings on the big ends. The two-cylinder motor has three bearings of open-hearth steel, ground on all surfaces. The crankcase, which is of aluminum, carries the gear case and the rotary valves. These gears run on annular ball-bearings, are marked to insure the proper timing, and are easily removable for inspection. Where the rotary valve is concerned, the valve housing makes the seat for the valve, and is cast of bronze. The valve itself is cast-iron, and is self-grinding and adjusting. It is driven by miter gears, and permits a full charge to enter the crankcase, regardless of the engine speed, making the motor extremely flexible. Thermo-siphon circulation is employed, while dual ignition using a high-tension magneto is fitted, a mechanical, gear-driven oiler taking care of the lubrication. The Willet motor is made in sizes ranging from 8 to 70 horsepower, all being properly counterbalanced, so that they run very smoothly at any speed.

Limousine Electric Fan.—The Motor Car Equipment Company, 1727 Broadway, New York, is introducing an electric fan designed for use in limousines. The motor is adapted to run on the current of an



LOCATION OF LIMOUSINE FAN.

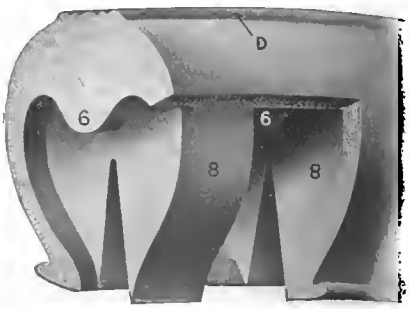
ordinary 6-volt ignition battery. The fan is intended to be placed in the roof of the car, and, being very powerful, keeps the air inside always cool and fresh. The interior of limousines and other closed cars is so apt to be hot and stuffy during the summer that this innovation will certainly be welcomed.

"Klaxon" Warning Signal.—According to the makers of the Klaxon, the Lovell-McConnell Manufacturing Company, 361-365 Market street, Newark, N. J., a musical note does not penetrate or command. It is the discordant note that dominates, and the Klaxon is guaranteed to produce the most startling discord ever heard. The device is electrical in action and is operated by a small electric motor and battery, commanded by an ordinary push button. On the end of the motor shaft is a toothed wheel that rubs across a knob fastened to the steel disk or diaphragm, the vibration of the latter producing the sound. The Klaxon can be easily applied to the right or left hand side of a car and the operation of installing it is very simply and easily carried out. It is manufactured under the patents of M. R. Hutchinson, and C. S. Knowles, 5 Arch street, Boston, Mass., is the sole distributer.

Dayton Airless Tires.—The ideal tire would seem to be the one possessing all the good features of the pneumatic and the solid rubber tire without the bad features of either, and this is something the Dayton Rubber Manufacturing Company, Dayton, O., think they have in the Fawkes tire, which was first placed on the market in 1906. It is of the non-inflated, punctureless type, and according to the makers, it more nearly meets the requirements of automobile work than any of the kind yet devised. When it first appeared it met with a very large demand and the plant could scarcely keep pace with the orders, but internal

SECTION DAYTON AIRLESS TIRE.

troubles, ending in the disruption of the firm, caused a loss of the success thus achieved through the long delay involved in litigation. The Fawkes patents became the property of one of the officers of the company, who is now the general manager of the Dayton Rubber Manufacturing Company. In the two years intervening large sums have been spent in tests and experiments, with a view to improving the Fawkes tire, and the result is known as the Dayton airless tire, which is illustrated herewith. It is now being manufactured under a number of new patents by the above company. Its construction will be apparent from the sectional view, showing that the columns of rubber are made of different sizes and strengths, and are placed at various intervals according to the load the tire is designed to carry, the factor of strength having been carefully computed and tested. A report by C. F. Adamson, M. E., shows the deflection or resiliency of the Dayton airless tire to be about 10 per cent. greater than that of a pneu-



METHOD OF REINFORCEMENT USED.

matic under the same load conditions, the vibration being the same. Nothing but the best of materials worked by modern machinery are employed, the durability of the tires having been proved by the experience of hundreds of users of the Fawkes tires, which have stood up for 20,000 to 30,000 miles. Various types of treads are made to fit either standard clincher or quick detachable rims.

VOL. XIX NEW YORK—THURSDAY, JULY 30, 1908—CHICAGO No. 5

THE AUTOMOBILE

WHAT THE BIG TOUR TOLD IN RELIABILITY

FORTY-SIX cars started from Buffalo, July 9, in the memorable 1908 tryout, known as the "Fifth Annual Reliability Touring Contest of the American Automobile Association." Thirty-two of these cars were of touring variety, and fourteen belonged in the runabout class. At Saratoga, N. Y., July 23, there were twenty-three surviving clean-score touring cars and five runabouts—a remarkable conclusion of a remarkable test.

As if the 1,675 miles' journey were not sufficient to determine beyond question the reliability of American cars, the five tied runabouts are now being driven once more over the course, in an effort to evolve a winner of the Hower trophy.

Furthermore, if it had not been for a combination of circumstances the three touring car teams would also have participated in a renewal of the journey. But one team was prevented from so doing by the business duties of a member, while another trio declined to accept the special committee's decision regarding a protest, the details of which are hereinafter stated. This left a single team of the three tied trios, and, after reporting for an official start on the morning of July 24, it formally withdrew, declining to win unopposed, and, therefore, the Glidden trophy returns to the custody of the touring board of the American Automobile Association as its official depository until next year.

The automobile-buying public, which had followed closely the progress of the contest, was inclined to regard the run-off with mere curiosity, and, perhaps, some wonder that the interjection of prize trophies should have made it necessary to carry the test to so merciless a conclusion, in order to decide this point.

The wonder of the demonstration of the fitness of American cars of all types, powers and prices to negotiate such highways as the States provide, under such abnormally strenuous conditions as were set by the rules, grows with contemplation and analysis of the results. Nothing like it has ever preceded.

A "perfect score" meant the maintenance of a time schedule that but once was as low as 17 miles and but once as low as 18 miles an hour, in both cases over the roughest of water-break abounding mountain roads, and during the other ten days ran from 19 to a fraction under 20 miles an hour, the legal speed limit at all times being regarded by the schedule makers. It meant that during the run no replacements could be made of parts not carried and catalogued on the list given the committee, and that all adjustments, replacements and replenishment of fuel should be made on tour without allowance in the time schedule. None was possible outside the run, for all cars were placed under guard from the checking in at night until the checking out in the morning, so that the cars could not be touched.

Yet for twelve days the cars had battled with the worst roads the Middle and New England States had to offer, in a run of 1,675 miles, furnishing an average of close to 140 miles a day, a touring proposition that even the most enthusiastic voyagers-a-motor would hesitate to undertake simply for pleasure purposes.

Pennsylvania furnished two days of rough going through the Alleghenies and added a third in the Delaware Water Gap region, that meant bumping the bumps and chug-chugging up grades that put frames and motors to as cruel a test as the East can furnish. New York gave good roads most of the way, and so did Massachusetts. Maine, New Hampshire and Vermont, however, were penetrated to their picturesque wilds. The Poland, Rangeley and Bethlehem district highways, to put it

Typical Scene of the Big Tour—This Was at Poland Springs in Maine, Where a Night Stop Was Made.

mildly, were not built for "joy riding." Then came the wind-up run of 184 miles to Saratoga, on a 20-mile-an-hour schedule. It embraced a scramble over the Green Mountains that put even the run in and out of Bedford Springs in the shade for knock-out qualities. Here were water-breaks that could not be "one—two—three—foured," and furnished sheer drops of from two to three feet. If any part were weak from long pounding there would have been no escape for it.

The conduct of the tour was businesslike and effective. Chairman Hower was courageous in carrying out rules, and rendered his decisions promptly, without any diplomatic attempts at glossing them over by roast-saving compromises or diplomatic soft-soap. It was particularly noticeable on this tour that his decisions carried with them no conspicuous aftermath of dispute and argument, and there were few penalization points at which any pretense of protest was made. One highly important question, and, in fact, the crucial one of the tour, was left by the chairman to the officials, owing to its affecting his own club and incidentally a maker to whom he was indebted for the use of his pacemaking car, and this constitutes the one jarring note.

Facts Relative to Protest Are Conflicting.

The facts relative to the protest are conflicting in not a few respects, but sufficiently congruous to make it certain that there only could be in the realm of equity one decision.

Immediately after checking out Thursday morning, at Bethlehem, N. H., J. W. McGuire stopped when one-half mile from the checking station to take off the tire chains. Two men were on the job, and the utmost dispatch used. The chains, without wait, were tossed into the tonneau and the car was off in hot chase of the chairman's pacemaking machine. Nothing more was said of the matter by observer or driver. The car waited in line at Saratoga one hour to check in, there being no intimation on the observer's part that 3 minutes should be added to the car's running time because of the time lost taking off the tire chains, and nothing was said of this time by the observer before checking in. Immediately after checking in, the observer made up his report card, recording the three minutes' time lost. Driver McGuire signed it, and, immediately after signing, noted the 3 minutes recorded. He at once protested, claiming that the time spent in removing the chains was less than one minute, which would not affect his checking in because of the two minutes' leeway permitted. The observer claimed he took the time accurately, from the time the car stopped until the time it started again, and for this was censured by Chairman Hower, because observers were explicitly instructed to take the actual time required on the tire work, and not the time from the stopping of the car until it started on the road again. Much talk was heard because of the observer not having made out his report until after the car crossed the checking line. McGuire made a mistake in not asking the observer immediately after the chains were taken off as to the amount of time consumed. It was not obligatory on the observer to give this time without being asked, as his duties were simply those of observing and recording his observations.

Both Driver and Observer at Fault.

In commenting upon the decision in which the Pierce car was given a clean score, Chairman Hower dwelt on the fact that the car waited in line for over one hour, and that no work was done on the car during that time excepting to fill with gasoline and oil. The contest was not one of watches, but of cars, and it was not the spirit of the rules to throw out a perfect-score team because of a dispute in which it was apparent both driver and observer were at fault.

Earlier in the run penalties were thrown off other makes of cars on technical grounds. One Oakland had 2 points removed which were imposed for having a person other than the driver and mechanic pour water into the radiator. The car was by the roadside. R. M. Owen had bought a pail of water for 60 cents and only required a part of it. He asked anybody else if they wanted what remained, and, being answered in the positive, proceeded to empty the remaining contents of the 60-cent pail into the Oakland radiator. The rest is known. The observer, faithful to duty, recorded it and the chairman at first imposed the 2 points, but later a sensible interpretation removed the points. On the first day of the tour three or four cars crossed the line ahead of time, but the penalties were removed.

Only One Day without Penalties.

Of the 12 days of the tour there was only one in which not a car received a penalty, that blissful day being the ninth out, or the run up the ocean side from Boston to Poland Springs. Perhaps it was the two days of resting in Boston, coupled with the exceptional entertainment offered, that was responsible for the only clean day of the run. Certainly it was not the roads because in places there were trails through forest land where recent forest fires had destroyed the timber on either side, and at other times sharp jutting stones threatened tires, springs, and axles. Not a few of the cars took big chances on broken culverts and sharp turns, as well as with deep sand, but in spite of it all the cars were victors.

The worst day was "Black Monday" of the run from Bedford Springs to Harrisburg over the mountains and six cars received penalizations, in all 1,696 points being lost on the day. The evils of the day were not altogether responsible for the heavy toll; rather the previous Saturday climb from Pittsburg to Bedford over the Alleghenies weakened a few of the machines, and the second day of mountain work completed the breakdown. The remaining 10 days of the tour were about equal in the penalty score, although the toll was heaviest at the start.

In all twenty-seven penalizations were imposed, which does not mean there were twenty-seven cases of defects, as it often happened that a car broke a spring one day and was penalized points for being late in arriving, and the following day the car withdrew as a contestant, preferring to put in a new spring and take the full 1,000 count. This condition shows up as two penalties, when in reality it is but one. Eliminating all cases of this, there were but twenty-one cases of troubles in the twelve days of the run. Of these three were cases of wheel breaking, the offenders being Van Tine's No. 29 Garford, Jones' No. 25 Studebaker, and Clark's No. 22 Marmon. Three went out through springs breaking, No. 32 Selden, No. 12 Franklin, and No. 106 Franklin. In addition to this were a few other cases of spring troubles: Frank Nutt broke a leaf and the No. 28 Oakland broke every leaf of one spring on the third last day, but was able to continue without replacement until the end of the tour. Two cars were eliminated because of cracking cylinder castings: No. 102 Moline went out when 3 miles out of Harrisburg, the casting of one pair of cylinders breaking, due to a too thin portion in the wall between the waterjacket and the cylinder bore. The car was run to Philadelphia on two cylinders, at which point a new casting was put on. Howard Marmon broke a cylinder casting the last day and had to withdraw.

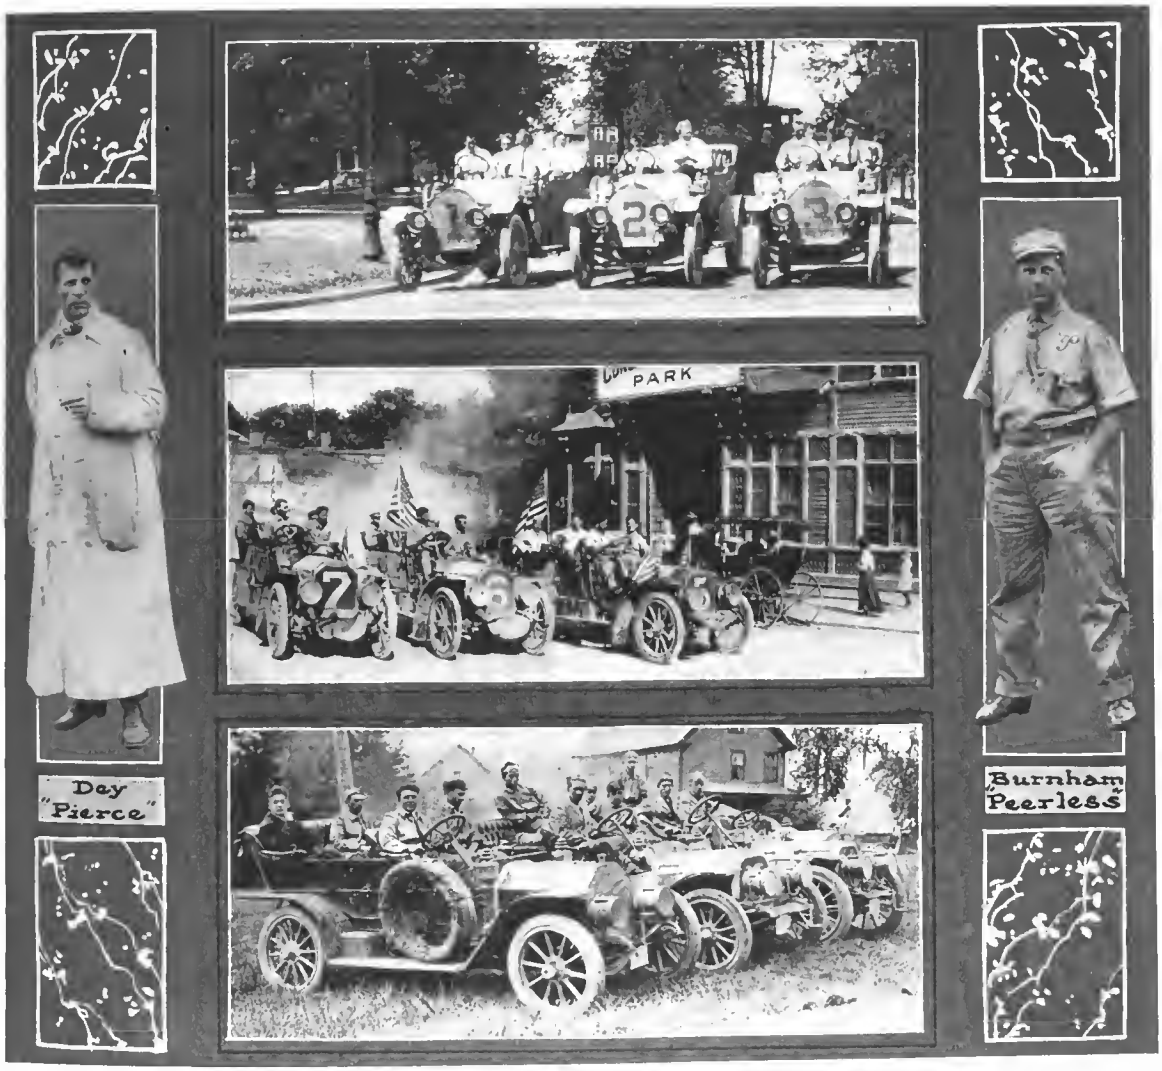
Repairs Were Accomplished Skilfully.

There were three or four cases of rear axle trouble. Hurlburt broke the drive shaft in the rear axle of his No. 31 Garford on the third day out and lost 8 points by using a new one; No. 111 Overland broke a rear axle leaving Pittsburg, but a new one was made in a blacksmith shop and the car finished the run. Owen's No. 4 Reo struck a hole too severely the second day out and had to straighten a back axle, which ran through the tour without any more attention and in good shape, there being no evidence that anything had ever occurred; and another of the Overlands broke a rear axle on the second last day's run, due to skidding when giving the road for a contesting car to pass. The No. 18 Gabriel horn Oldsmobile skidded into a stone on the second last day of the run and sprung the axle driver shaft. It was repaired in a blacksmith shop in a few minutes, after which it was impossible to detect anything wrong with the wheel or the smoothness of the car's running.

Few parts of the cars were watched more closely than the back axles, and it is one of the pleasing comments of the tour that they stood up so well. There were three cases of truss rods supporting the axles breaking, but all of them were speedily repaired. But one case of frame trouble arose, that being the No. 110 Overland that was ditched on the run to Harrisburg and cracked the left side frame member midway of the axles. The driver and mechanic in a blacksmith shop made a repair that lasted in perfect shape until the car reached Saratoga. Transmission troubles were practically eliminated, there being only three cases of such and all of minor importance.

ing knuckle, the car striking the curb so hard that the wheel was forced almost under the car. The replacement was made in an hour or so, and the car finished the tour without any further trouble. No. 28 Oakland had trouble twice with its straight tubular front axle, caused primarily by the driver taking the water breaks straight head-on, so hard that the tonneau passengers were nearly thrown out at times. The axle was taken out and reset; later it gave way and an improvised truss rod was used.

How many of the cars behaved is best gleaned from information given by drivers of many cars upon their arrival in Saratoga, and which information in not a few cases was borne



The Trio Numbered 1, 2, 3 Is the Pierce Team; 5, 6, 7 Are the Peerless Trio, While the Lower Picture Consists of the Oldsmobile and the Two Haynes Cars. The Pierce Team Represented the Buffalo Club; the Peerless, the Columbus Club; and the Mixed Team, the Chicago Motor Club.

Record exists of only one case of brake trouble, that being the seizing of one brake on No. 22 Marmon when the brake was too hurriedly applied at a water break. The brake seized not because of faulty design, but due to the bearing for the expanding cam becoming loose and allowing the cam to lodge crosswise between the shoes so tightly that the wheel had to be taken off before the cam was properly positioned. Front axle troubles were few. No. 9 Premier ran into a curb on the sharp turn entering Kingston and broke the hub bolt of the left steer-

out by the testimony of observers. No. 35, Oldsmobile, had six tire punctures, used one new casing, did not make a single motor adjustment or brake adjustment, and broke one spring shackle bolt, which was replaced by one of the driver's manufacture, without penalty. This car took on about four gallons of water on the entire run, showing the efficiency of its cooling system.

Teddy Dey's Pierce had a brake adjustment as its only alteration. Arthur Kumpf made a brake adjustment and added a new casing. The story with the Pierce and Peerless machines, which

was recorded in these pages last week, remained unchanged. No. 14, Franklin, did not make an adjustment of any nature, had only one puncture, but not a blowout, and did not need a new casing. Harry Hammond's No. 8, Premier, went through without a single adjustment other than one on the brakes, and used but two new casings. The two Stevens-Duryea machines traveled with particularly little tire difficulties. Driver Clark of No. 17 had but one puncture, and the observers reported very little use of the brakes on this car in the mountain work, the driver controlling the machine when going downhill by the motor.

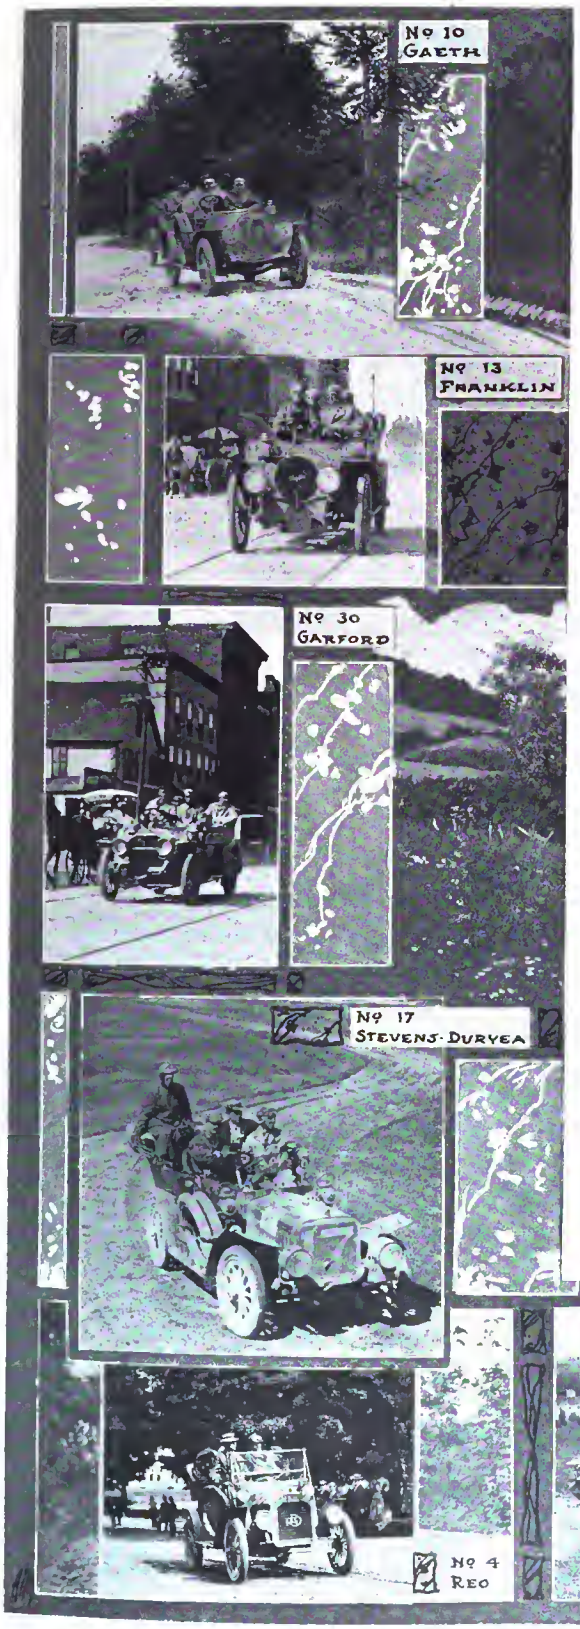
The two-cylinder Reo cars and the two-cylinder Oakland machines astonished a great many of the four and six-cylinder enthusiasts on the run. Before leaving Buffalo many of the tourists predicted they would never reach Pittsburg, but all four of them were on hand ahead of time at Saratoga, and not one of them took the 1,000 count, either. In fact, Lockwood's Reo and No. 28, Oakland, have a unique record, being the only two cars to receive penalization and not to withdraw. Lockwood's carried 12 points and the Oakland 58. It was remarkable how these little machines performed in mountain work, and the manner in which they took grades on the high speed. Both of the Reos were excellently handled by Owen and Lockwood, and the cars were in as good shape and running as well at the completion of the tour as at the start. The Oaklands were not so well handled, and No. 28 received all of its penalizations for reckless driving over water breaks. The other Oakland received better care, and went through in good shape, and without a point against it from the start to the finish at Saratoga.

As previously stated in these columns, radiator troubles were noted in a great many cases, and continued until the end of the tour. Radiators leaked near the base plates, and every job of soldering sufficed but for a day or more, when the water would be running out as bad as before. The cause was more with the radiator support than with the radiator construction. From a careful analysis the trouble can be avoided to a great extent by the use of a heavier transverse member of the frame in front of the engine as well as a more flexible method of support.

Fenders stood up remarkably well, and in the majority of cases rear fenders are attached sufficiently far from the wheels so that when tire chains are used they do not rattle against and wear out the fenders. Only two cases were noted where holes were worn in the fenders because of the tire chains hitting them. Last year many fenders were put entirely out of commission. This year only the Studebaker, that hit the bridge and tore off the right front fender, finished so dilapidated. The wrapping of springs was practised by a great many contestants, and proved most efficacious, not a case of springs so wrapped being broken. Shock absorbers gave a much better account of themselves, but the flexible shafts of the speedometers gave a little trouble, although 100 per cent. better than a year ago. Lamps and horns stood up well, and other accessories showed little evidences of the hard usage that was only too evident last year.

Ready to Start on Another Run.

In fact, looking over the cars as they stood in line waiting in front of the Grand Union Hotel, at Saratoga, to check in, made



everybody proud. The cars were in good condition, and looked more as if they were waiting to start out on a 2,000-mile run than after having actually finished such a test. The wheels were straight, mud aprons were tight, axles were in line, bodies were good, and every motor was hitting regularly on all of the cylinders. It was a supreme moment for American cars when, after 1,700 miles of running, twenty-eight of the original forty-six came in with perfect scores, and all but six of the cars that started were on the road and finished the tour. To the European with his fine roads, this might not be considered a great performance, but over American roads it is a truly great achievement, and one which speaks volumes for the American makers who had confidence that their cars could stand the test.

This year's Glidden deserved double, in fact, triple the entries it received; next year's run will be a winner, when more than one hundred cars should be lined up for the fray. Already many of the makers this year have signified their intentions of being on hand in next year's event. The Moline interests, that were represented by one car this year, will be in with a team next year. Franklin, that had a little spring trouble, due to not using shock absorbers or wrapping the springs, will be back next year with a team. It is certain the White people will have a team or so; other newcomers will be on hand; all of the old-time supporters who have now been in for several seasons will be on hand; and the 1909 tour through the West will, according to present prospects, be the biggest motor demonstration that America has ever seen. D. B.

PIERCE RUNABOUT NO. 103 WINS THE HOWER TROPHY

PITTSBURG, July 29.—The two Pierce runabouts left here this morning for Bedford Springs, and to-night a conference will take place as to a continuation of the tie, in case neither car loses points to-day.

The following letter was this morning handed to E. C. Ferguson, official tour representative, and practically explains itself:

"With the elimination of our most esteemed and worthy competitor, a situation presents itself, which, together with other complications, has prompted me, with Mr. Stoddard's authority, to withdraw the Stoddard-Dayton cars now tied with the two Pierce cars for the Hower trophy. Our confidence in the ability of our competitors to continue this thing under the existing circumstances for the major part of the summer, together with Mr. Moore's refusal to continue further with his entry, and Mr. Cox's determination to withdraw from the contest, prompts us to take this action. We wish to pay the highest tribute to all our competitors in this run-off, and sincerely trust that our action in this matter will be taken in the proper light.

"(Signed) HARRY B. TUTTLE."

Brockway in Overland Which Had Unfortunate Skid.

When R. M. Owen left this morning in his No. 4 perfect-score Reo, carrying Dai Lewis and the confetti, he said he could continue indefinitely on the job.

How They Reached Buffalo.

BUFFALO, July 25.—The five perfect score runabouts that left Saratoga on Friday morning on the run-off for the Hower trophy all reached here to-night with their scores in as good condition as when the run proper was completed.

The first day's run from Saratoga to Syracuse, a distance of 160 miles, the roads were fairly good.

In contrast to this was to-day's run from Syracuse to Buffalo, over a 180-mile course, 9-hour schedule, 50 miles of which were over slimy roads that had been soaked with a 12-hour rain and additionally moistened by a good downpour that lasted during the first two hours of the run.

The five contestants involved in the run-off are the following:

No.	Car	H.P.	Entrant	Driver
100	Pierce Arrow	40	R. D. Garden	J. S. Williams
103	Pierce Arrow	40	Chas. Clifton	E. A. Rattling
104	Premier	30	G. A. Weidley	G. A. Weidley
107	Stoddard-Dayton	45	G. P. Moore	G. P. Moore
112	Stoddard-Dayton	45	R. G. Cox	R. C. Shirk

Of these five machines the two Pierces are six-cylinders, of 43.8 horsepower; the other three, the Stoddard-Daytons and the Premier, are four-cylinder cars of much lower rating. The Premier is the only example of low-tension ignition, as well as the only one of the five having a multiple disc clutch. The two Stoddards and the Premier use selective gear-sets, where the Pierce cars use a three-speed progressive set, with the speed-change lever on the steering pillar immediately beneath the steering wheel. Magneto ignition is employed on all, and of special interest is the use of Goodrich tires on all five contestants.

The drivers are in every instance quiet, stand pat performers, not a single one of the grandstand variety. Ed. Rettling is a tester at the Pierce factory. He drove the Pierce pilot car in the New York-Pittsburg run in 1903, the car being a two-cylinder type. He drove from Boston to St. Louis in the St. Louis tour, obtaining a perfect score certificate. The present run is his third big performance. J. S. Williams is coupled with the New York Pierce Agency. He drove in the 1907 Glidden, carrying off a perfect score. George Weidley is factory superintendent and treasurer of the company, as well as being head of the Premier engineering department. He has never driven in a tour previous to the present one. Both of the Stoddard-Dayton drivers are novices at the touring game, but have already shown their knowledge of road driving.

Scores Were Unchanged at Cambridge Springs.

CAMBRIDGE SPRINGS, PA., July 27.—The five runabouts arrived here from Buffalo to-night without any change whatever in their perfect scores. The run was uneventful.

Third Day Brought the Changes.

PITTSBURGH, July 28.—To-day saw the commencement of the finish, with Weidley going out with a broken front axle, 48 miles out from Cambridge. The prime cause was a water crack, evidently due to the too sudden chilling of the forging. The immediate cause was due to coming over a sharp rise and then down a steep dip that at the bottom had a double washout. The place was just beyond Mercer, and on the regular route as laid out in the book, the detour made in the tour proper going through New Castle being avoided in the run off. Owing to heavy rains the better part of last week all through that section, and from the fact that the roads are of clay and with many sharp grades, there were many washouts covering 40 miles of the day's run.

Premier Runabout in the Maine Woods.

From this, it is the opinion of all in the present run that had the tour proper gone over this section there would have been less perfect scores, as it was a hard road to travel, irrespective of last week's weather conditions. Weidley was not the only one to come to grief, as Moore on No. 107, Stoddard-Dayton, broke his side frame, and, while finishing to-day with a perfect score, is hardly in position to continue for another day.

Another car not in the run was seen on this stretch out of commission with the down lever from the steering gear broken short off. The driver of this car had not ten minutes before offered sympathy and help to Weidley.

At the finish of to-day's run the cars had little, if any, time to spare, and are a unit in declaring the run the severest of them all. Weidley fixed up his axle and came in this evening.

THOMAS DUE TO-DAY IN PARIS ON LAST STRETCH

NEWS received late Wednesday afternoon to the effect that the Thomas car had crossed the French border and was rapidly approaching Paris, made it apparent that the American car would arrive at the French capital either that evening, or the next morning, thus making it the victor, by about 28 days, of the longest race that has ever been run, owing to the 30-day handicap of the Protos, due to the latter not having completed the crossing of the American continent under its own power by more than 1,000 miles. Dispatches received by the New York *Times*, from its staff correspondent on the American car, tell of the arrival at Berlin over one of the most magnificent stretches of highway that they had encountered in the whole of the 13,000-mile run. During the last stretch to the German capital, between Koenigsberg and Berlin, the Thomas was lost to sight, and, as no bulletins were sent ahead, the arrival of the American car in Berlin was entirely unannounced. It did not take long for the population to discover its presence, however, one of the first to greet Schuster being Colonel Koeppen, the white-haired father of the German lieutenant who successfully piloted the Protos into Paris Monday evening. The news of the Germans' successful arrival at the French capital did not disturb the American crew in the slightest, and but for the fact that botb Schuster and Miller are practically worn out with night and day driving, they would keep on at the same pace.

The silent and unannounced entry of the Thomas into Berlin brought forth profuse apologies and regrets from the German automobiling fraternity there, as had the car's coming been made known in advance, there would have been an escort to meet them some distance out of the city, and a formal reception. Count Sierstorpf, president of the Imperial Automobile Club, and Rudolf Ullstein, one of the four brothers who own the *Zeitung Am Mittag*, the German daily which backed the Protos car in the race, took Schuster and his fellow travelers in hand and tendered them a breakfast at the Fuerstenhof hotel, while the sight of the car over which the Stars and Stripes waved attracted a vast assemblage before the hotel.

In fact, from the moment the American car raced across the Russian frontier into Germany, there has been the most marked difference in the spirit of the greetings, a small group of peasants at Eydtkuhnen sending up the first real cheer that the Thomas crew had heard since leaving Japan. The sight of the American flag seemed to arouse the greatest enthusiasm, the pretty flaxen-haired peasant girls hurling bouquets and kisses at the travel-stained crew as if they were long-lost friends. All the way from St. Petersburg, the roads have been so fine that it was monotonous driving, after the constant struggle to make progress carried on ever since leaving Vladivostok.

Thomas Siberian Trip a Marvelous Feat.

When it is considered that on the run from Vladivostok the Protos has, through unfortunate accidents happening to the Thomas, been able to gain more than 10 days, the fact that the Americans will reach the end of their 20,000-mile journey but 48 hours behind is certainly a marvelous accomplishment. This will mean that they have won with a leeway of fully 28 days, as had they reached the French capital at any time within the 30-day allowance granted them against the Protos, due to the latter never having completed the American stage of the journey to San Francisco, as well as the fact that the Thomas crew wasted a fortnight in finding out that the Alaskan trails were impassable. The most wonderful feature of the run of the Thomas is to be found in its having covered every foot of the way under its own power, being the first to arrive at San Francisco of the numerous competitors then in the race, while the Protos never got beyond the Union Pacific Shops at Ogden, Utab, to which it had to return three times in succession for repairs of a serious nature. Had it complied with the rules as originally laid out, by completing the journey to San Francisco overland, thence to Vladivostok by steamer via Seattle, it is safe to say that the American car would have been half way across Siberia before the Germans arrived in the Czar's dominions.

But the Germans were game sportsmen for all that, as was evident from Lieutenant Koeppen's determination to keep on at all hazards, and by the manner in which he brought the Protos car through the numerous difficulties encountered in the Siberian wilds. Both the Americans and the Germans, as well as the Italian Zust team, started from Vladivostok together, the French De Dion team going as far as the Russian Pacific port, only to abandon the race there, Marquis De Dion giving as a reason, that having been through the Pekin-Paris of the year before, this would be only a repetition. The Thomas and its German rival kept together for the first few hundred miles, when Schuster found the Protos hopelessly mired. The German car was extracted from its mud bed with the aid of the Thomas' motor and the Germans stole a march on the Americans by abandoning the so-called road for the railroad right of way, which gave them a two-day lead before this was discovered. The Thomas crew also took to the railroad tracks, but in bumping its way over stretches of the unballasted ties, the car was damaged and five days were wasted in obtaining replacement parts, this being but the first of a long line of mishaps that befell the Americans from that time on.

From the very outset the crew of the Zust appears to have suffered the greatest misfortunes. It was at first reported that the Italian car would be withdrawn along with the Frencb De Dion from the Siberian leg of the race, but this later proved unfounded, and Scarfoglio started out of Vladivostok at the same time as his German and American competitors. His progress has been exceedingly slow, however, and althougb he would be entitled to second place by arriving in Paris at any time within 30 days after the Protos reached there, it does not seem likely that this will be the case, as according to last accounts he was still 5,000 miles away from the French capital when Lieutenant Koeppen officially registered there Monday evening.

Question of Awarding Thompson Prize.

It will be remembered that on the evening prior to the start of the race from New York, which took place February twelfth, Lincoln's birthday, a banquet was tendered to the drivers and crews at the A. C. A., during the course of which Jefferson De Mont Thompson, chairman of the racing board of the American Automobile Association, presented American flags to each one of the cars and offered a prize of $1,000 in gold to the crew which should be the first to deliver its flag in Paris. Actually, the Protos car has been the first to reach Paris, but under the rules, one of the most important of which had to be waived in order to allow it to continue as a competitor, it is not the winner of the race and it did not cover the entire distance under its own power, which would apparently seem to be a vital condition precedent to a claim on the Thompson prize.

The reception of the Protos at Paris was a most frigid affair compared to the great ebullition of joy which greeted the arrival of the German "victor" at Berlin, this being the manner in which the Protos was generally hailed there. In the French capital, two members of the committee of the A. C. F. bowed and shook hands with the Germans in front of the *Matin* office, and it was all over, indicating rather strongly that France's automobile pride is still writhing over the Grand Prix defeat, as well as its lack of representation in the present event, an impression that is further strengthened by the statement which appeared in *Le Matin* the next day, that the race had officially ended at Berlin for the German car, and accordingly there was no necessity for an official reception at Paris, though how this was figured out it is difficult to say.

OBSERVED IN THE BREAKING-IN OF A NEW HAND

By CHARLES B. HAYWARD.

"HANDSOMELY there, you lubber—steer small or we'll sink the next ashcart that crosses our course," yelled the driving instructor to the novice at the wheel beside him, and whom he had allowed to assume that post of importance in a burst of overconfidence in the learner's skill. A close escape from making a brougham minus one of its rear wheels, and the succeeding lunge to the opposite side of the more or less crowded street, that threatened bringing up against something undesirable, had considerably shaken this confidence and brought forth the above remark. In navy parlance, "handsomely" means a very little at a time, as in lowering something on the end of a tackle, while "steering small" is something that the aspirant for honors at any steering wheel has to acquire before he can become proficient in the art of guiding either a sea-going craft or an automobile.

Until he can learn to "steer small," the beginner is a memace to himself and everything else on the road; a ten-acre lot is the best place for him. That irresistible desire to yank the steering wheel half way round every time an obstruction looms up, is an extremely dangerous tendency that the average beginner finds himself possessed of the first time he takes his seat behind the steering wheel, and realizes what an *awful* speed the car is actually traveling at. Queer how 10 miles an hour seems five to the new man when he is sitting beside the driver, but when he is the driver himself and he finds it his duty to keep the machine on its course, and, worse than that, to avoid other users of the road, every one of whom appears to be heading straight for him, that otherwise most moderate speed seems little short of appalling. It looks as if nothing short of a half turn of the steering wheel would suffice to clear another onrushing car, or the exasperatingly dilatory wagons and pedestrians, who will persist in getting in the way.

Wide Streets Become Alleys to the Novice.

There is no street wide enough for the brand new hand at the steering wheel of an automobile to have plenty of seaway in. He finds the broadest of them all too narrow for him when he gets started on the see-sawing process that only the acquirement of the knowledge of "steering small" can cure. When it is borne in mind that it is seldom necessary to give the steering wheel a whole revolution to bring the front wheels to rigbt or left locking position, it will be apparent that the slightest movement of the wheel is greatly magnified in the effect it has on the angle of the front wheels, while the latter in their turn increase the effect they have on the direction of the vehicle according to the speed at which the latter is running. Hence, guiding an automobile, particularly through thick traffic, is an art that involves quite a few factors, the full value of each of which must be realized by the novice before he can attain to that eminencc of easy nonchalance with which the average driver tools his car along the city streets, apparently undisturbed by the maze that surrounds him on every hand.

It is only when he comes to appreciate the fact that the car responds instantly to the slightest movement of the steering wheel, for the automobile is the easiest vehicle to guide that has ever been invented, that the beginner really commences to learn how to take care of what is now justly considered the most elementary rudiment of the art of running an automobile. Over self-consciousness of the fact that he is sitting behind the steering wheel and that it is his duty to turn it, betray the tyro into most of his lapses from the straight path, and it was this same quality that made it difficult for many people to master the bicycle. They were under the impression that the handle bar had to be forcibly wrenched to one side or the other in order to obtain the desired result, whereas a little experience demonstrated that steering was practically an unconscious function, once the art was acquired. So it is with the driver of an automobile. It is nothing uncommon to see the driver of a racing automobile remove both hands from the whcel to adjust his goggles while going more than 30 or 40 miles an hour on the straightaway, and instances have been known where this apparently foolhardy performance has been indulged in at extremely high speeds.

Though such a practice is hardly to be recommended, the automobile can always be relied upon to guide itself to a certain extent when running straight ahead and at a moderate speed. If the forward wheels are parallel to the driving wheels, the car will continue to run straight ahead, with little or no deviation, so long as it does not run against an obstacle. Realization of this fact goes a long way toward firmly establishing the confidence of the beginner, for, as was the case with the new band on a bicycle, the would-be driver of a car hesitates to relinquish the wheel for an instant, lest the machine take a sudden freak into its head and turn a corner unaided.

There Are Other Equally Important Things.

This, together with the acquirement of sufficient ability in handling the wheel to know just how little or how much to move it to attain the desired end, is rcally all there is to the business of guiding the car. The rest is entirely a matter of experience—the gaining of that familiarity in handling the car which makes the driver a part of his machine. But it is only after he knows how to "steer small" that this begins to count, and the nautical term expresses a grcat deal in its brief two words, as most ambitious would-be drivers find out very quickly.

After all, steering a car is really the easiest thing to learn about its control, though gaining a knowledge of this rudiment is considerably complicated by the fact that there are other equally important operations that must be carried on simultaneously with the guidance of the vehicle. The average gasoline car presents an imposing array of pedals and levers to the inexperienced eye, and at first it becomes a difficult matter to remember just wbich ones require to be pushed and which have to be pulled to bring about certain results, and at the same time give that undivided attention to the essential of steering that seems to be so necessary in the early stages of the curriculum. It looks so ridiculously easy, the way the average driver starts and stops, takes his car in and out of the mazes of traffic, changes gear and performs the other operations incident to handling the car, that it does not seem possible that there are so many perplexing things to it as confront the beginner.

The new hand's first inclination is to jam on the emergency brake the moment that danger threatens, not realizing that the running brake under his foot is sufficient for all uses at ordinary speeds, and that reckless use of the more powerful brake is apt to mean a substantial increase in the tire bill, not to speak of the only too obvious indication of a lack of skill on the part of the driver that it implies. But next to steering, gcar-changing is the most difficult thing to master, and not alone the mere performance of this operation, but a realization of when it is necessary and when not. But the gasoline motor has a habit of stalling, when its speed and the gear on which it is running do not happen to agree, and when this happens in the middle of a busy street, it is more than sufficiently disconcerting to cause the novice to regard this peculiarity of the motive power of the car with due respect.

Beginners Invariably Leave Gears in Mesh.

Doubtless one of the hardest things to instill into the new hand is the danger of leaving the car with the motor running and the change-speed gears still in mesh, but it is a habit that is almost universal, as well as one that requires several lessons to overcome. Even then, there is as apt to be a relapse into forgetfulness of the importance of this essential, as there is to be due heed paid to the instructor's forceful reminders on this

point. An automobile has not ordinarily the inherent power of running away that is given as one of the most dangerous propensities of the standing horse, but when in this condition it can only be compared to the restive animal that will bolt on the slightest provocation. With the gears in and the motor running, only the interlocking device on the emergency brake that holds the clutch out prevents the car from starting of its own accord, and that it does not take a great deal to bring this about was made evident by a comparatively recent case in which a driver started the motor of his car with the gears in while on a ferry boat. The latter bumped the side of the slip in coming in and the shock was sufficient to release the emergency brake lever and allow the car to start. It all took place so quickly that the car went overboard, despite the folding gates, before the astonished driver could do anything.

Oiling is another item of considerable importance that the driver, in the process of having the rudiments thrust upon him, forgets to take due note of, so that frequently where the instructor purposely stops the flow of lubricant through the sight feeds to test the skill of his pupil in this regard, the latter goes ahead as if everything were in perfect working order. On many cars the oiling system has been reduced to such a high degree of self-contained simplicity that only periodical attention is required, but this is not the case on the old-timers that do duty as a medium for instructing those who aspire to the title that was imported along with the first French automobiles.

If the number of coachmen who have taken up the curriculum of the New York School of Automobile Engineers, at which the foregoing observations were made, were generally known, the weight of the phrase about the passing of the horse would be given a great deal more credence. Your typical Jehu is a born type and mechanical knowledge usually comes hard to him, but he makes an excellent driver at all times and particularly in the city. He is accustomed to paying due regard to the rights of other users of the road and he seldom has resort to speeds of much more than 12 miles an hour at any time. It is so much faster than he has ever been accustomed to traveling that he does not wish anything higher but is content to plod along at this conservative pace. He is methodical, too, and does not forget the necessity of oiling, filling water and gasoline tanks, and, above all, of keeping his machine scrupulously clean.

He forms quite a goodly portion of the number of men who seek automobile education as a means of bettering their positions in life, and while his mechanical skill upon graduation will not average quite up to that of the remainder of the student body, which is composed of young mechanics, electricians, garage attendants and the like, on the whole he makes a much more careful and conscientious driver than the latter class.

HOW ONE MAN BECAME AN AUTOMOBILIST

By A. H.

WHEN the auto fever first took hold of me, in the summer of 1906, my problem seemed insolvable. Even a runabout of standard make cost more than I felt justified in paying for a mere luxury, and yet such a vehicle would have been unsatisfactory, as it seats only two persons, and my family consists of three, none of whom would take much enjoyment in autoing if one had to be left behind every time the car was taken out. At last a friend, himself the owner of a fine gasoline touring car, advised me to investigate the merits of a certain steamer, which at this time, in spite of my careful study of the automobile question, I had never so much as heard of. I soon ascertained that second-hand cars of this make, in fair condition, could be bought for very little money, and in a short time I found what I wanted and made my purchase. My car cost me, delivered at my home, a little less than $375. This was just before cold weather set in, so that I did not attempt to get any use of it until the following spring.

On the opening of the season of 1907, as there was no one where I lived familiar with this particular make of car, I sent for an expert from a garage and repair shop in a neighboring city. He repacked a few valves, made some necessary adjustments, fired up, and gave me instructions in the management of the car. The following day I fired up and took the car out myself, unassisted, and ran it for several hours, both morning and afternoon. For a number of days all went well, and we were delighted with our acquisition.

But, after a time, a series of annoying mishaps occurred; none of them serious; many, in fact, mere trifles that I could now set right myself. They would not have been so perplexing if there had been any one in town acquainted with this make of car. As it was, I was obliged to depend on the foreman of the railroad repair shops, who is at liberty only after hours, and not always then. I got along, however, with some expense and much exasperation, almost on the verge of giving up autoing as too troublesome and costly an amusement for me, until the first week in July, when on the top of all my other troubles, the superheaters burned out.

Though disheartening enough at the time, this was really the best thing that could have happened, for it was the cause of my taking the car out of town to the repair shop above mentioned, where, with all necessary machine tools and spare parts at hand, a workman could do more in an hour than he could at my house in ten. My expert spent a few hours on the car, and did so thorough a job that from that day until the close of the season the car cost me less than one dollar for repairs and replacements. This does not include what I have paid for tires, which is another story. The tires were not new when the car came to me, and I have bought three new ones, at $22.22 apiece. I bought another before taking the car out this spring, so that I have four practically new tires, and two spares ones, good enough to carry for use in emergency. The car is in better condition now than when I bought it, and will undoubtedly cost far less to run this season than it did last.

During the summer, when I had ten weeks free, I ran the carriage nearly every pleasant day, at a cost of about $3 a week for gasoline. My entire outlay for the year, including original cost of car, three new tires, tools, and other equipment, gasoline, oil, barn rent, repairs, everything, amounted to a little less than $600. This is more than I intended it should be when I started out; but, considering all that we got for the money, it was probably money well spent.

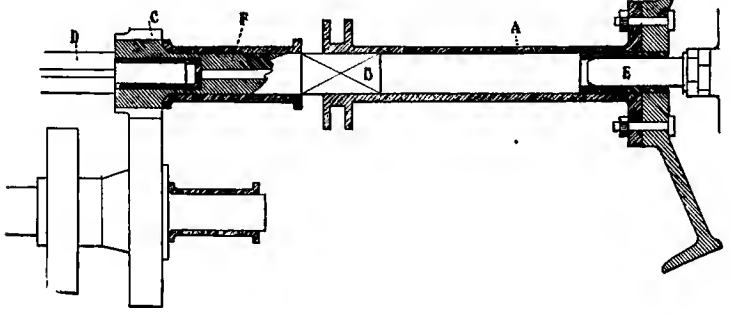
Being so much in the open air has benefited us all greatly. Autoing is better than medicine. Hitherto during the summer months books have been my chief occupation, and no open air amusement gave me much real pleasure. Last summer the automobile afforded a delightful form of recreation and a change of occupation so wholesome to both mind and body that I entered upon the work of the autumn and winter with a larger store of vigor than I had enjoyed for years.

Being unaccustomed to machinery and to the use of tools, I was surprised to find the automobile so simple and easy to manage and care for. My eleven-year-old boy can run it as well as I can: and I sometimes allow him to fire up, which he can do unaided, without one word of direction from me.

The little car is graceful in its lines and unpretentious in appearance. Indeed, it looks more like a buggy than an automobile, in spite of its low wheels, pneumatic tires and comparatively long wheelbase. It has ample power to carry four persons, is smooth-running and quiet, and easy to control even in the midst of a crowded street. Though it has its limitations and disadvantages, it has done all one could reasonably expect, and I am abundantly satisfied.

GOOD POINTERS FOR AMATEUR REPAIRMEN

OCCASIONALLY a car will be found in which unclutching fails to completely relieve the strain on the sliding gears, so that, although the clutch is disengaged, it is difficult to shift the gears. This is always due primarily to the forward journal of the squared shaft binding in the bushing in the first spur pinion which received the power from the clutch. The effect of this binding, however it happens, is to make the squared shaft tend to turn with the first spur pinion, and if any gear but the direct drive is in engagement there will be a drag imposed on the gears in mesh which will make them hard to shift. The cause of the binding between the square shaft and the pinion is another matter. If there is a flexible coupling between the clutch and the first spur pinion, the cause of trouble may be looked for in the gear box itself, in the shape of a sprung sliding gear shaft or badly aligned bearing carrying the first pinion shaft. Sometimes, however, there is no flexible coupling between the clutch and the gear box, and the clutch shaft A is internally squared to make a slip joint on a squared forward extension B of the first spur pinion shaft. See sketch. In this case there



How the Gearshaft May Become Sprung and Cause Binding.

is no more chance for disalignmcnt than is afforded by the side play in the square slip coupling just mentioned, and if, for any reason, that play is insufficient, the clutch shaft will forcibly slant the first pinion C out of line with the other shafts in the gear box, thereby cramping it on the shaft D carrying the sliding gears. Disalignment of this sort is usually due to sagging of the frame, and is to be corrected by suitably shimming the engine and the gear box, or the gear box alone, as circumstances require. If the engine rests on the side members of the frame by four narrow feet it may be difficult to hold shims in place under these feet. In this case both the front and rear ends of the gear box may be dropped to bring the gear box in line with the engine, and the rear end of the gear box may be dropped to bring the gear box in line with the engine, and the rear end of the gear box will have to be lowered more than the front end. If the gear box is boltcd to the under side of the cross members of the frame, shims are easily inserted, but if it rests on the latter it may be necessary to go to the trouble of soldering brass shims to the frame under the rear feet of the engine.

At Times Both Shafts Will Be Out.

In case it is found that the slide gearing and first spur pinion bind only in one position of the clutch, but are free when the clutch is turned 180 degrees, it follows that the clutch and pinion shafts are mutually out of line, probably owing to the internal squared portion of the clutch being out of line with the front bearing running on the engine shaft E, and the squared extension B of the pinion being out of line with the journal portion F. If these respective squared portions are separated and one is given a half turn it is likely that the errors will neutralize each other, making it very easy to correct the defect.

Some of the old forms of make-and-break igniters depend on mica washers for insulating the stationary electrode. These washers may be found at both the inner and outer ends, or at the inner end only. If they are at the inner end they are very easily rendered ineffective by deposits of carbon. It is of no particular avail to clean them with gasoline, if the oil soaks in between the mica leaves, since on subsequently burning out it leaves the carbon behind it, where, of course, it is perfectly inaccessible. For this reason the use of mica for internal insulation has been practically abandoned; but there are many cars still running which have igniters arranged in this way. Even when lava bushings are used, cleaning is occasionally necessary, although in this case it is much more effectual, and a little gasoline and sandpaper will keep a lava bushing in service for a long time. When the engine fails to ignite, particularly if all cylinders fail owing to a recent heavy dose of oil, and if the circumstances are otherwise such as to make it uncertain whether the igniters or carbureter is at fault, it may be desirable to test the insulation of the igniters without removing them. If the igniters have mica washers, an electrical test may be the only way to settle definitely whether or not the insulation is good. A very easy way to make this test is to use a battery of any convenient strength —a single cell will suffice—with a pocket voltmeter whose scale is proportioned to the battery used. All the electrodes are disconnected from the bus bar, and note is taken which, if any, of the igniters is making contact from the action of its cam. The others are then tested by putting the voltmeter in series with the battery, and connecting the free terminals of the voltmeter and the battery to the insulated electrode and the engine frame respectively. If the insulation is perfect the voltmeter will give zero reading. If the electrode is completely short-circuited, the voltmeter reading will be the voltage of the battery. If there is a partial short circuit due to carbon, the voltmeter reading will bear the same proportion to the full voltage of the battery that the resistance of the voltmeter coil bears to the resistance of the carbon short circuit, being low when the carbon resistance is high and increasing as the carbon affords a freer path for the leakage of current. If any of the igniters is making contact, the crank must be given a turn before testing it. If suspicion is directed to the magneto itself or the switch or wiring, one can tell whether or not a spark is produced at any igniter by touching the insulated electrode and the engine at the same time while the crank is turned. This test, however, will not betray carbon leakage.

A Simple Gasoline Separator.

An effective and very simple device for separating solid particles and water from the gasoline as it enters the carbureter is the tee connection shown in the sketches. The gasoline pipe is probably 1-8-inch pipe size and the union to the carbureter the same size. Both the pipe and the union can be threaded into the tee and a short 1-8-inch pipe 1 or 2 inches long is threaded into the bottom connection of the tee and is closed by a removable cap or petcock. The flow of gasoline through the tee will be slow enough to permit water and solid particles to setttle in the bottom pipe. Evidently the tee can be connected with ease, and without change in the length of the gasoline pipe, whether the carbureter connection is in the side or bottom. The threaded connections should be sweated together so vibration will not start leaks, this being a prolific source of trouble with poor joints.

ABOUT REPAIRING BROKEN CYLINDER CASTINGS

By M. E. WILSON.

WE recently had a couple of standard cylinder castings cracked as a result of the connecting rods breaking loose, and as we were too busy to await the arrival of new ones we set to work to repair them. No. 1 shows the first casting, which was cracked around the cylinder head just above the top of the piston stroke. Three one-inch holes ("*A*") were first drilled in the water jacket to examine the injury. Through these holes the crack was cleaned and "Smooth-On" put on; then a little solder was run into the crack on the inside of the cylinder. These holes were afterwards plugged with ordinary one-inch threaded plugs. Next, three 3-8-inch set-screws were run through the jacket and gradually set down against the cylinder head, offering little resistance to the flow of water and reinforcing the head immensely. This cylinder has been in use ever since—over four months—and we have discovered no signs of a leak nor any indications of weakness.

Another pair more seriously damaged is shown in No. 2 and No. 3. In this the crack was higher up, towards the center of the head. The crack was filled like that in the first casting and up seemed to be needed, however, and as the hand-hole plate on the top of the jacket was too light to hold screws, an iron strap was finally bound over the head and fastened with bolts ("*E*") through the lower part of the jacket, between the cylinders.

One end of the base plate of this casting was broken off, including the lugs for the bolts which hold the cylinder casting to the crankcase, and the repair made of this is also shown in No. 2 and No. 3. A dovetailed, overlapping brass corner was four set-screws ("*A*") put in to reinforce it. Some support higher moulded on and fastened by screws at "*C*," and the entire base was then reinforced by an iron band ("*D*") around it. As this was still not strong enough to take the strain of an explosion in the cylinder, a strap ("*B*") was put on, held to the side of the cylinder by the jacket hand-hole studs, with its lower end bent over and drilled to take the bolt through the crankcase. This cylinder, like the other, is still in commission and, considering its apparently hopeless condition when the job was undertaken, it runs surprisingly well. These two cases are striking illustrations of the fact that few repair jobs are absolutely hopeless.

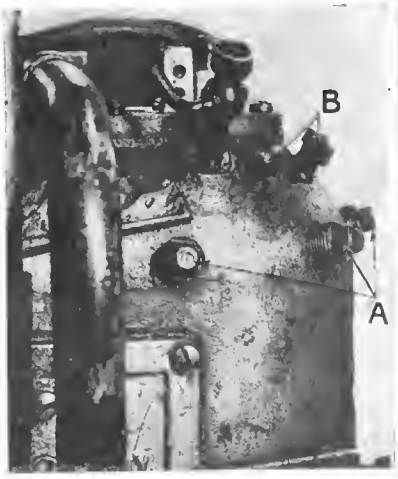


Fig. 1.

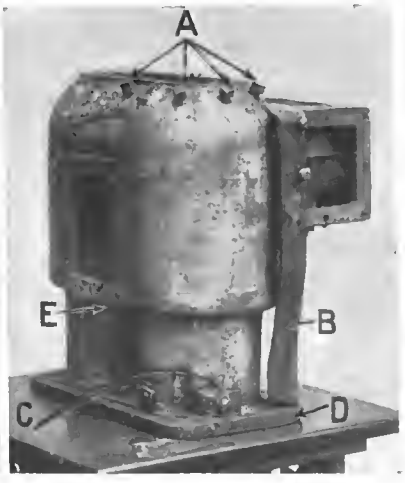

Fig. 2.

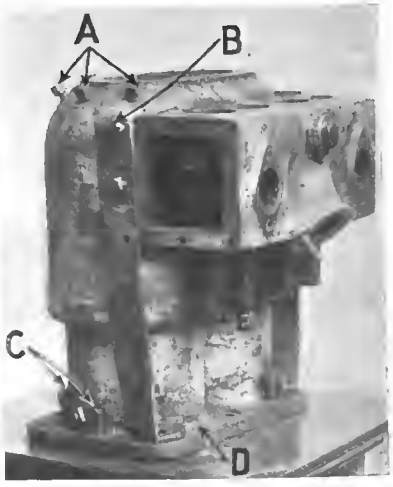

Fig. 3.

Reading from left to right, the illustrations show the manner in which two badly cracked cylinder castings were made sound. The first job is shown by the left-hand photo alone (Fig. 1), the letters A and B indicating the location of the holes made for examination, and the set screws. The other two pictures (Figs. 2 and 3) illustrate what was apparently a hopeless job, but which, with a little ingenuity, was remedied at practically a nominal outlay. The average repairman would have given up without attempting to fix it.

WHAT IT MEANS TO STOCK COMPLETE REPLACEMENTS

By JAMES E. COUZENS, Secy. and Treas. Ford Motor Company.

IT is as important to be able to fill a repair order as it is an order for a new car, and one of the principal troubles with so many automobile manufacturers is their inability to ship repair parts without keeping the purchaser waiting indefinitely.

Before the Ford Motor Company was organized I made up my mind that when I entered the manufacturing line I would make it impossible for a customer to fail to get any repair he might order, even if I had to dismantle a new machine to take care of the repair order. And when the Ford Motor Company was started that fact was kept in mind, and to-day a Ford owner anywhere in the world can order any part for a car, from a screw to a wheel, on any model, and have it shipped the day the order is received. We have to date made eight distinct models, but we carry a stock of repairs for each of them, and not only of each model, but for each little change made in each model, every one of which is carefully catalogued.

This is absolutely necessary and by putting yourself in the other man's place you will realize it. Suppose you are making a tour in the car you bought a couple of years ago, you have an accident and wire in for repairs. After waiting a day, suppose the house wires back "Account of machine being out of date cannot furnish repair parts ordered." How does that help you forty miles from nowhere? If we found that our parts department could not get the repair parts on the way in two hours, there would be another set of men for that department.

It costs money—lots of it—to maintain such a department. A quarter of a million dollars is easily invested in that way. Just the other day we issued a manufacturing order to make a one-hundred-thousand-dollar stock of parts for repair orders. But it's money well spent, for a satisfied customer means a recommendation of Ford cars to all his friends, and these personal recommendations are our biggest advertisements.

LETTERS INTERESTING AND INSTRUCTIVE

CORRECTING A WORN VALVE-SETTING.

Editor THE AUTOMOBILE:

[1,483.]—We hsve a Rambler two-cylinder car on which the factory setting of the valves is represented by the enclosed sketch. This is not ss we think it should be, and we would like to have your opinion as to the advisability of changing the original setting. We enclose a second diagram showing how we think the vslves should be set, but do not like to do this without first consulting you, and are accordingly taking the liberty of asking if you will help us out. EDWARD C. STILL.

Hamilton, N. Y.

If the car be an old one, the valve timing shown by your sketch illustrating the original setting of the valves, Fig. 1, would appear to be the result of wear, as this always tends to retard the valve operation. The intake appears to open quite late—almost 30 degrees on the circle of the flywheel, as shown by the sketch, whereas its opening should follow the closing of the exhaust valve as quickly as possible. The opening of the exhaust valve is also very much retarded, and, without knowing the circumstances, we should say that a motor with the valves set in this manner would be far from giving its rated output, and should think that it would tend to overheat considerably, particularly at high speeds, where it is desirable to give the exhaust valve quite a substantial lead. The closing of the intake valve appears to be the only part of the operation that is approximately correct, but this also seems to be retarded somewhat beyond what is consid-

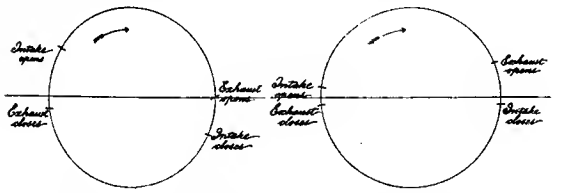

Diagram of Valve Action with Suggested Remedy.

ered as good practice by a great many designers, the majority holding it open not to exceed 15 to 20 degrees on the circle. We think it would also be advantageous to make the closing of the exhaust valve correspond more closely with the upper dead center.

Regarding your second diagram showing the valve-setting that you propose, Fig. 2, we should suggest making the closing of the exhaust and the opening of the intake closer together. The opening of the exhaust valve appears to be about right to get the best results, unless the motor is designed to produce its normal output at a rather low speed, say 800 r.p.m. or less, in which case the exhaust could be held closed for probably 10 degrees later. The intake valve is not held open long enough, according to this diagram, as suggested in our criticism of the original valve setting. Unless the car is an old one, in which case the trouble might be due either to worn contact faces, such as on the cam, tappet rod and the like, or to displacement of the cams on the camshaft, it may be that an error has been made in assembling, but in view of the numerous and painstaking tests through which the majority of manufacturers now put their motors this hardly seems probable. If the cams be integral with the shaft, it may be that the timing gears are improperly meshed, and upon comparing your two diagrams this seems to be likely in the case of the intake, as its lateness of opens corresponds with its delayed closing, but this does not hold good in the case of the exhaust, only the opening of which appears to be delayed. With the exception of the point of closing of the intake valve on your proposed diagram, the latter corresponds closely with present approved practice.

CARBURETERS USED IN THE GRAND PRIX.

Editor THE AUTOMOBILE:

[1,484.]—In your July 2 issue is a table of mechanical features of the Grand Prix racers and reference is made to carbureters, viz., perpendicular currents, parallel currents, converging currents, etc. I wish you would publish some information concerning these so that I could get some idea of what they refer to. I wish you would publish a description of the Mercedes engine that won the Grand Prix. AUTO ENGINE WORKS,

St. Paul, Minn. J. D. MOONEY, Pres.

The abbreviations you refer to are employed to indicate the manner in which the main air supply entered the carbureter and passed the gasoline nozzle. "Perpendicular currents," for instance, means that the air passed the gasoline nozzle perpendicularly; "parallel currents" indicates that two currents of air are led by the nozzle, while "converging currents" that two currents of air are brought together at the point of the nozzle. We must confess that we have never seen carburcters described in this fashion before, and on looking the matter up, find that our Paris representative has literally translated the French descriptions of the cars. Of course, these are perfectly legible to the Frenchman, but we do not wonder that you wished further light on the subject to make them intelligible. You will find a description of Lautenschlager's Mercedes, which also applies to the other cars of the same make, on page 137 of the July 23 issue of THE AUTOMOBILE. This is not as comprehensive as it might be, but the car is a specially designed racing machine and this represents the extent of our present knowledge.

QUERIES CONCERNING FUEL CONSUMPTION.

Editor THE AUTOMOBILE:

(1,485.]—Would be pleased to have you answer the following in "Letters Interesting and Instructive": Compared with similar cars in general, what can be regarded as a fairly economical consumption of gasoline per 100 miles for a 2,500-pound touring car with 6 by 7-inch opposed motor when carrying five passengers on average country roads?

With car and load identical in other respects, what per cent. more fuel (if any more) will be used by four-cylinder motor than two-cylinder opposed of same rating, traveling same road? Compared with 6-inch by 4-inch opposed motor, about how much more fuel will be required by good 4 1-2 by 4 1-2 cylinder vertical two-cycle motor, other conditions being the same?

Is there any preparation to be had which will prevent or lessen the accumulation of rust in cooling water in an automobile?

Pleasant Lake, Ind. C. A.

Five to six gallons would be an economical showing for this distance, but the consumption would naturally vary according to the amount of low-gear work that was necessary, as well as with the character of the road surface. On a good road, such a car as you mention ought to be capable of covering 17 or 18 miles to the gallon. The difference between this and the consumption of a four-cylinder motor of equivalent power in the same car would not be very great, though readily perceptible. Doubtless such a car would average 15 to 16 miles to the gallon under similar circumstances. As compared with the two-cylinder opposed horizontal motor of the four-cycle type, the four-cylinder, two-cycle motor might use anywhere from 10 to 50 per cent. more fuel, according to the efficiency of its design. Unfortunately, the two-cycle motor has not been brought to the same degree of standardization that characterizes the four-cycle, so that it is naturally difficult to make comparisons of this kind that will hold good generally. It is safe to say that the two-cycle, four-cylinder motor will require considerable more fuel than the two-cylinder, four-cycle, as the two-cycle is not as economical as the four, and adding to the number of cylinders always tends to increase the consumption, but just what this excess would be cannot

be stated definitely, as two-cycle motors of some makes are known to operate very much more economically than others.

There are numerous boiler compounds on the market that are intended to prevent scale and rust on the interior of a boiler and we have no doubt they would be found equally effective in the case of an automobile radiator. Probably more so, as the conditions in the latter are not so bad, in that the water seldom actually boils away to any great extent, so that scale-forming conditions are not present.

AN IDEAL THAT IS ALREADY "ON WHEELS."

Editor THE AUTOMOBILE:

[1,486.]—I have read so much this year about the "ideal car" that I, an old subscriber to "The Automobile," would like to have my say. My "ideal" is not a "dream on paper," but a "dream on wheels," the 1908 Model M Pope-Hartford. Now, I haven't come to this decision from merely looking at the specifications of the 1908 Pope-Hartford, although this alone is quite convincing. But when you consider that my 1907 Pope-Hartford was driven 10,000 miles through four States over variable roads and at a good speed, as I like to go fast, and never failed to take the opportunity to let her out, all of this strain without one repair of any kind whatsoever and with but a 25-cent replacement (a part of the magneto), you can see that my decision is based upon sound facts brought to light by experience.

The 1908 Model M Pope-Hartford "30" touring car has all of the standing up qualities of the 1906 Model F and the 1907 Model L, and the wonderful hill climbing ability also, but with the luxury of any $5,000 car built and the style and general appearance of the most costly foreign or American cars. But just think of the comparatively low first cost and the very low upkeep. What more ideal car would the idealist want?

I am in no way connected with the trade, but just one of many enthusiastic Pope-Hartford owners.

E. D. R.

Spring Lake, N. J.

Your ideal is the first tangible one to come to light, and those who are indulging in "dreams on paper" for future investment might well follow your example and indulge in a "dream on wheels," as some of the proposed ideals will take a long time to materialize and undoubtedly many of them will never reach that state.

(The writer of the foregoing letter has requested us to give his name and address to any inquirers, but did not care to have it published in this connection.—ED.)

ANOTHER IDEALIST IS HEARD FROM.

Editor THE AUTOMOBILE:

[1,487.]—Every little while someone writes about his ideal car, so I think I will add mine to the collection. Engine, three-cylinder, two-cycle, 30-horsepower, thermo-syphon circulation, three-point suspension, internal expanding clutch, three speed and reverse selective type of change-speed gear-set, and a unit power plant. Atwater-Kent spark generator. Wheelbase 105 inches, 36 by 4-inch tires on Fisk detachable rims, full elliptic springs with Hartford-Truffault shock absorbers. Pressed steel body with detachable tonneau. All trimmings that are usually brass, such as levers, etc., to be gunmetal or copper oxidized finish; also lamps, speedometer, windshield trimmings and the like.

I believe that if half the time that is spent in polishing brass were used to keep the engine and transmission clean and in proper shape, owners would get better service out of their cars.

Paterson, N. J.

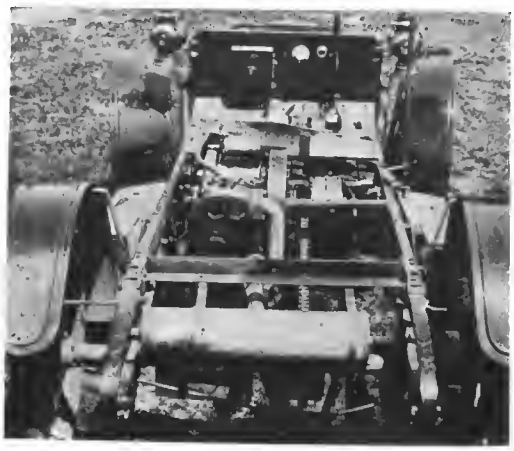
ANTI-BRASS.

As is the case with another contributor to the list of ideals, yours seems to be one that is already on wheels and not merely in the paper stage, as the specifications you quote sound strangely familiar and read something like a catalogue. In other words, it strikes us as if you were describing the Elmore three-cylinder two-cycle car. We quite agree with you on the subject of brass polishing and it is noticeable that the tendency in this direction is quite general. A plethora of fine brass work to polish is certainly out of place on the car when its owner is also its driver and caretaker. There is nothing quite so ornamental as brass trim when it is kept in proper shape, and likewise there is nothing that looks quite so disreputable when it is neglected as that same brass work. For the autoist who employs a man to do nothing but drive and look after his car continually, this does not involve any hardship, as a good car does not require a competent man's entire time to keep it in shape, no matter how much it is run. But where the owner is his own chauffeur it is quite another story. Polishing brass is rather a lazy man's job and takes considerable time, which, as you say, might much better be applied to keeping the mechanical details of the car in shape.

INCREASING HORSEPOWER OF AN OLD CAR.

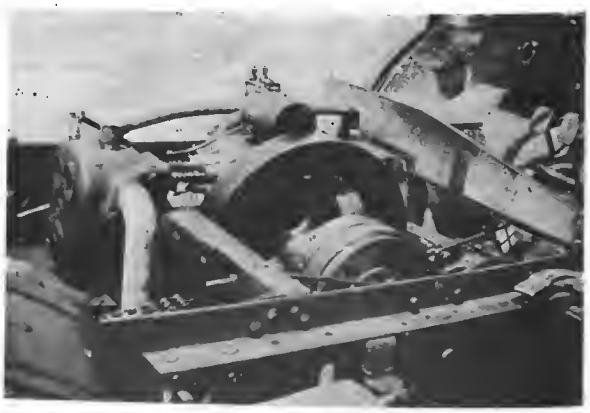
Editor THE AUTOMOBILE:

[1,488.]—In your issue of "The Automobile" of June 25 you published a letter from Joseph Sylvester, of Jamaica, N. Y., in which he made an inquiry as to whether he could install a two-cylinder 10-horsepower motor on a 6-horsepower chassis. You advised him not to try it, and as he does not state the make of car it would be impossible to say whether it would be of advantage in his case or not. Enclosed please find two photos of a remodeled one-cylinder Pope-Hartford. The motor is a Bellfus two-cylinder, 18-20-horsepower. As it is the same make as he inquired about and which you expressed ignorance of, I will say that it is all to the good.



Rear View of the Remodeled Chassis.

Fig. 1 shows chassis view. At the rear can be seen the muffler; and this also shows how wheelbase was lengthened six inches by use of three-quarter springs. Fig. 2 shows the power plant. The forward cylinder is just under the footboards. The car was also changed from a rear entrance to side entrance, this being made possible by the lengthened wheelbase. The car now carries five people comfortably and has a maximum speed of 47 miles per hour. New parts required were as follows: Engine and timer, oiler, three-quarter springs, one foot of chain, two dash coils, new mudguards, copper gasoline pipe, gas tank being moved forward under the bonnet. The old one-cylinder engine is sawing wood.



How the New Power-plant Was Installed.

DOUGLAS ADAMS.

Keene Valley, N. Y.

The job of installing a larger power plant on an old car such as you refer to, and that afforded by the problem submitted to us by the inquirer in question, are two very different things, as you will see by again referring to the specifications he gives in his letter. The substance of his

inquiry was whether it would be advisable to install a twin-cylinder horizontal engine of the same power as the vertical engine originally placed on the chassis, i.e., 6 horsepower, in order to overcome the excessive vibration, or whether it would be better to employ a 10-horsepower engine of the twin-cylinder opposed type. We are of the opinion that it would not pay the inquirer to do either with nothing better than the chassis he described to build on, and because you have succeeded in installing an 18-horsepower motor on a chassis well adapted to carry it does not suffice to alter his opinion. You have evidently made a very good job of rebuilding your car, to judge from the photographs submitted and published herewith, and there are doubtless many old-time cars that could be similarly improved.

PLACING A NEW CAR ON THE MARKET.

Editor THE AUTOMOBILE:

[1,489.]—I am a member of a company which has developed a gas engine especially desirable for auto vehicle work of all kinds, and as we are not fully convinced in regard to the style of vehicle with which to introduce our engine, I am taking the liberty of addressing you on this subject. Your intimate knowledge of the field and its wants will enable you to give me some helpful suggestions. If you will kindly answer the enclosed list of questions I will greatly appreciate it:

(1) What in your judgment would be the best vehicle for us to make first—Runabout, touring car, roadster, freight truck, or light delivery wagon? If roadster, what horsepower?

(2) If runabout, what horsepower and price? Same with regard to touring car, truck and delivery wagon, this constituting questions 3, 4 and 5.

(6) Which of the above could be most readily sold and which would be the most profitable?

(7) Which class of vehicle will be in the greatest demand in the future? A. C. H.

Los Angeles, Cal.

(1) Considering all the circumstances, we should think the building of a standard chassis upon which could be fitted a runabout, touring, roadster or light delivery wagon body would be the most advisable manner of starting. Twenty horsepower would be ample for a light car, and to keep it within the bounds of general demand in the various rôles it has to assume it should not exceed 25-30 horsepower. This also serves to answer your questions 3 to 5 inclusive. No. 6 is rather more difficult. At the present time the pleasure vehicle is easier to sell and may, in consequence, be put down as more profitable in a new enterprise.

(7) There is no doubt that the commercial vehicle will be in great demand as progress and education in its use develop, but it is likewise quite apparent that the demand for the pleasure vehicle must be equally great, as it is constantly being brought within the reach of an increasingly greater proportion of the population.

ABOUT THE BEST ROUTE TO SARATOGA.

Editor THE AUTOMOBILE:

[1,490.]—I should be much obliged if you would kindly inform me in your columns of "Letters Interesting and Instructive" what is the best road to take to go to Saratoga, good roads being desired. Also, what is the best road at this particular time for going from Albany to the Berkshires? I have heard that the road usually given in the road book is now being repaired, and is, therefore, in very bad shape for a good part of the way. J. R. PETERS.

South Orange, N. J.

The best way from South Orange to Saratoga is via Newark, Newburgh, Poughkeepsie and Albany, which is covered entire by the following references to the 1908 Blue Books: Newark to Passaic, Ridgewood and Hohokus, N. J., pages 101-103 of Vol. 3, connecting at Hohokus with the New York-Tuxedo-Newburgh route, pages 99-100 of the same volume, giving the exact mileages, with full running directions to Newburgh. Descending to the ferry and taking same to Fishkill Landing village (not Fishkill village proper, which is four miles farther inland), immediate connection is had with the New York-Poughkeepsie route in Vol. 1 (last part, pages 79-80), which will carry to Poughkeepsie. See (particularly) in this connection the Fishkill Landing diagram, page 73, which will make this part of the route clear.

Poughkeepsie Section Route No. 2 (pages 276-281 of the New York book, Vol. 1) will extend the run to Albany by exact mileages and reliable information throughout. Albany Section, Route No. 8 (pages 328-329 of the New York volume, No. 1) will carry you through to Saratoga by what is generally considered the best of the several available routes, though this line was not revised new for 1908. Your information as to the repairs being made to the Albany-Pittsfield usual routes this year is correct, an emergency which is covered by a special route via the Post Road, Valatie, Chatham, Stockbridge and Lenox (pages 305-307 of Vol. 1, New York State volume). Except for the unusual conditions between Albany and Pittsfield, the roads mentioned are good practically throughout.

INCREASED MILEAGE WITH LESS PRESSURE.

Editor THE AUTOMOBILE:

[1,491.]—As you are probably aware, I have made very considerable experiments to find out, firstly, whether reduced pressure decreases the speed of the vehicle fitted with pneumatic tires or not: secondly, whether decreased pressure decreases or increases the life of the tire. The first series of tests prove that reduction of pressure in the tires makes practically no difference in speed.

The second series of tests prove that you can use your tires with less preseure than was commonly thought, and, therefore, the whole car rides more easily and smoothly, and at the same time the tires actually last longer. The tests have all been carried out on the road on my own six-cylinder Napier.

The weight of the car complete, as I generally drive it, was a shade under 35 hundredweight. The result was that with 60 pounds pressure in the front tires, 880 by 120 mm., they ran 88 per cent. further than when the pressure was kept at 70 pounds to the square inch, and when the preseure of the back tires (895 by 135) was reduced from 85 pounds to 70 pounds, I got an increased mileage of 49.9 per cent. It is, therefore, clearly proved, that reduced pressure means greater comfort on a motor car and less expense in tire bills.

I am now carrying out experiments with still lower pressures, but owing to the distance one has to run, it takes a considerable time to obtain results. S. F. EDGE.

London, Eng.

This is an extremely interesting line of experiment and one that is of vital importance to automobilists at large, particularly as the results shown run directly counter to the prevailing impressions on the subject, tire manufacturers without exception cautioning users at all times to maintain their tires well inflated. They also go counter to the reasons that tire makers and tire experts have advanced for keeping pneumatics well inflated, in that a good pressure prevents the side walls of the tire from bending so much, which is given as the chief cause of rapid wear, and especially of that bugaboo of the autoist, blowouts. Further data as the result of carefully carried out investigations will not only be of great interest but should prove valuable.

AN UPHOLDER OF THE FRICTION-DRIVEN CAR.

Editor THE AUTOMOBILE:

[1,492.]—Referring to your letter No. 1,452, I would like to say that I think if Mr. Meiser will get the right kind of a friction drive car, it will prove very satisfactory. There are a great many hills in Southern California, having driven an Earl roadster all over the hills around here.

Was there ever an eight-cylinder Darracq in a Vanderbilt Cup race? WALDO D. WATERMAN.

San Diego, Cal.

We have no doubt that friction-driven cars are making a success in practically every part of the country, or it would not be so easy to introduce them. But only the man who owns and drives such a car knows what it can do.

There was never an eight-cylinder Darracq used in a Vanderbilt cup race. The car you evidently have in mind was the Darracq, driven by Demogeot in the straightaway speed trials at the Ormond-Daytona meet, January 29, 1906, and in which he made the record of :58 2-5, in the two-mile-a-minute race.

COMMERCIAL MOTOR VEHICLES NUMEROUS IN INDIANAPOLIS

INDIANAPOLIS, IND., July 27.—There are few lines of business in this city that do not use, in some form or other, an automobile runabout, delivery wagon or truck. It is only within the last two years, however, that the delivery wagons and trucks have attained anything at all like popularity.

In the first place, the city is well adapted to the use of motor commercial vehicles. Streets are well paved and well kept; there are no hills and the expense of up-keep is materially lessened by the maintenance contract that has become quite popular within the last eighteen months.

The maintenance contract, in fact, has doubled the use of the automobile for commercial purposes in little more than a year. Under it the selling agent agrees to keep the vehicle in service every day in the year for a specific amount each month. The truck or delivery wagon is to be left at the agent's garage over night, when it is thoroughly overbauled and cleaned. If it breaks down in service an emergency car is sent to take its load and finish its work for the day.

There is only one instance recorded in Indianapolis where a business concern has discontinued the use of automobiles. An investigation revealed that this was a firm of undertakers that used an electric runabout night and day for five years, then discarded it for the very good reason that it was badly worn out.

With one exception, all local department stores are using commercial vehicles; a firm of plumbers have had built a very successful delivery wagon with a Marmon chassis as a basis; wholesale and retail cigar dealers, manufacturers of food products, wholesale and retail grocers, furniture dealers, brewers, piano dealers, express companies, parcel delivery companies, hardware merchants, manufacturers and many others are successfully using delivery wagons and trucks.

The latest acquisition is an immense gasoline van just placed in service by a firm of household goods movers. The company also sells second-hand furniture, so that the big van is used both for delivering furniture and moving household goods. This is the first company of its kind to use a motor vehicle.

There are about 250 runabouts and touring cars in the city used for business purposes, many of which are used by city and traveling salesmen. During the last year half a dozen implement and farm machinery companies have equipped their salesmen with runabouts. The public utility corporations and the various municipal departments have automobiles in service.

Both those who sell and use automobiles for commercial purposes say that the motor wagon and truck has come to stay.

AUTOMOBILES NEEDED IN CEYLON.

In a report from Colombo, Consul E. A. Creevy states that there is a considerable market for automobiles in Ceylon, which needs only proper development. Some 1,200 tea and rubber estates are situated on the island, and as railroads are still very few practically every one of these could make good use of an automobile. The question is whether the need would be recognized by the expected purchasers. At present there are only about 200 cars in use, and only one of them of American make.

The conditions demand a machine which is a good hill-climber, reasonable in cost, and economical in operation. The importance of the last requirement may be seen from the fact that the Colombo price of gasoline is 50 cents a gallon. The island is very mountainous, and most of the plantations are reached only by narrow roads with heavy grades and sharp turns, where the driver is liable to find himself confronted at any moment by a bullock cart taking up the whole width of the roadway, with a rocky wall on one side and a precipice on the other.

No business can be done by means of catalogues only. The manufacturer who wishes a share of the Ceylon market should begin by sending out a representative with a sample of his machine, with the assurance that a supply of parts would be kept at Colombo. This last condition is essential, as it is useless to expect a purchaser to place himself in the position of having to wait, in case of accident, three months for a part to be shipped from the United States. The three companies at present handling autos in Ceylon are listed at the Bureau of Manufactures.

USES A HORSE IN HIS GARAGE.

A horse in a garage certainly seems out of place, but that is what the curious may see any day in Asbury Park, N. J. The idea originated with William Powell, night foreman of the Zacharias garage. He uses the animal to haul the cars to and from the washing stand, instead of having them pushed by manpower, and says he gets the moving done in one-third the time. There is also a considerable saving in wages, as some five or six men are dispensed with by the new arrangement. The plan is very simple. The horse is direct-connected to the front of the car, transmitting his power to the rear hoofs without the use of a clutch; a chauffeur specially trained in the language of "gee" and "haw" takes the wheel, and away they go. The present record to and from the stand is between 40 and 50 seconds.

WASHINGTON'S AUTO MAIL COLLECTING.

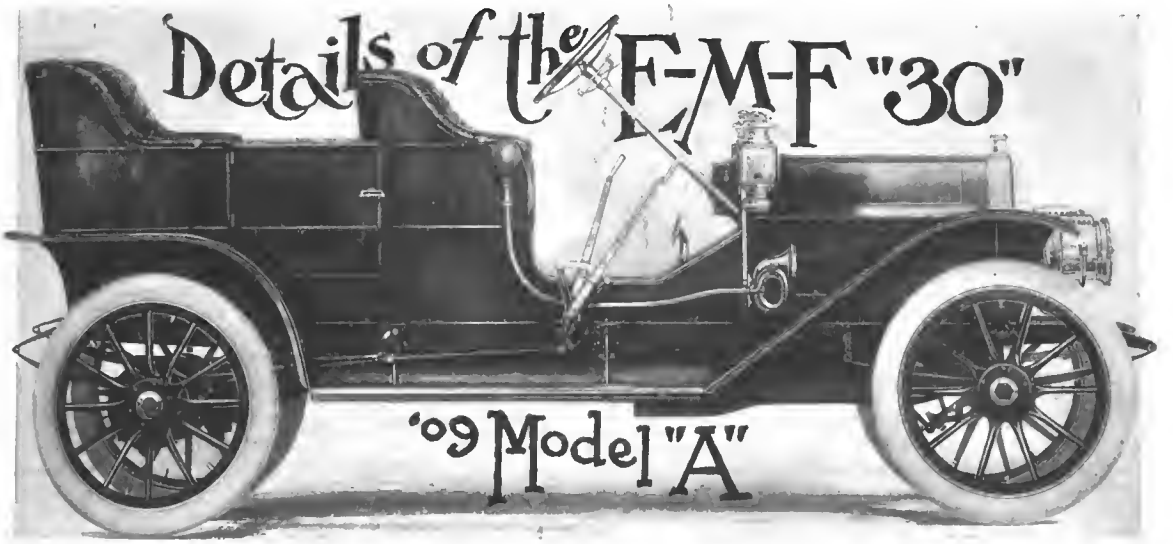
WASHINGTON, D. C., July 20.—Two single-cylinder Cadillacs have been purchased by the postal authorities of this city for the purpose of determining the advisability of substituting automobiles for the present horse and wagon system of collecting mail. A special appropriation of $1,440 was secured for this purpose and out of this sum the cars must be maintained for a certain period. The routes selected for the two automobiles, which will be put into service on August 1, are located in the upper and lower parts of the city. While the cost and maintenance of the two automobiles is $60 more than that now allowed for the horses and wagons, the use of the automobiles will result in the saving of two letter carriers, who are to be assigned to the delivery service. If the results achieved with the automobiles prove satisfactory it is likely automobiles will be substituted entirely for the horse and wagon collection service throughout the District of Columbia.

AUTO TRADE DIRECTORY FOR JULY, 1908.

The *Automobile Trade Directory*, which is issued quarterly by the Class Journal Publishing Company, 231-241 West 39th street, New York, has just made its appearance for July, 1908. It is now a volume of 384 pages, thus exceeding in size any of its previous issues, and it is correspondingly more replete with information of a nature that every designer, purchasing agent, garageman, or, in fact, anyone who has to do with the automobile industry, has pressing need for at one time or another. It is the aim of the publishers to make it a most complete compendium of the American automobile industry, and a review of its pages leaves no doubt as to the manner in which they have succeeded in carrying out this work. Every manufacturer of anything pertaining to the automobile, whether directly or indirectly, is listed in a manner that makes reference easy and saves much useless searching, while there is also a great deal of information in the shape of data that is of considerable value.

The tax imposed upon foreign automobiles entering Germany has yielded only 1,618,834 marks instead of the 3,500,000 marks expected. In addition it has deprived the country of other and more important revenues, and altogether has proven itself to be the unsatisfactory legislation that its opponents predicted.

Details of the E-M-F "30"



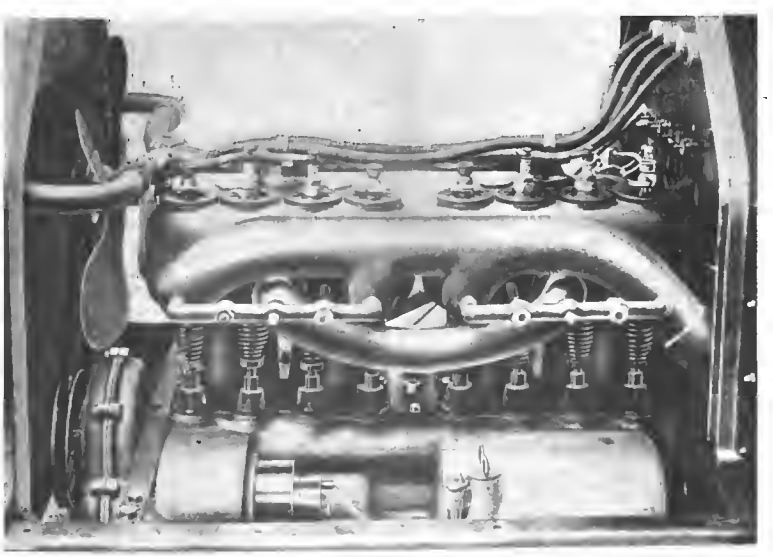
WITHIN the last few months a new descriptive term has come into vogue in automobiling. It is the word "classy," and, in a few letters, it conveys more about the appearance of some of the new medium-priced cars that have been responsible for its creation than a ream of description. Hence, the publicity statement that the new Everitt-Metzger-Flanders production is the "classiest thing on wheels at its price." That there is ample justification for this will be evident when the foregoing illustration of the new E-M-F "30," which is its official title, is viewed with the knowledge that here is a modern four-cylinder machine, of the most approved design and construction, to sell complete for $1,200.

But it is not all appearance by any means. The official announcement of the consolidation of the Northern Motor Car Company and the Wayne Automobile Company, both of Detroit, and the experience and standing of such men as Messrs. Everitt, Metzger and Flanders in the automobile industry is a guarantee that the car will be all that is claimed for it, while the backing of men like William T. Barbour, J. B. Gunderson, Charles L. Palms and J. B. Book goes to show that the new company will have almost unlimited resources and intends to do things on a scale that makes the building of a modern four-cylinder car at this price a possibility.

However, the car really speaks for itself, as the following specifications go to show. A perusal of these makes it plain that the machine is what has generally come to be accepted as standard construction. There are no freak innovations or radical departures of any nature. The 30-horsepower motor has its cylinders cast in pairs with the water jackets integral and valves all on one side. The latter are interchangeable, and are mechanically operated. The cylinder dimensions are 4-inch bore and 4 1-2-inch stroke, the motor being designed to produce its rated power at a moderate compression and speed, factors which make for durability. A feature that will be generally commended by both designers and users alike is the elimination of the aluminum alloy supporting arms of the motor. This material is employed for the crankcase proper, but the weight of the motor is carried on pressed steel arms of "U" section, which do not weigh any more than the usual aluminum supports, but which are far stronger and much more flexible, thus insuring greater safety at this vital point.

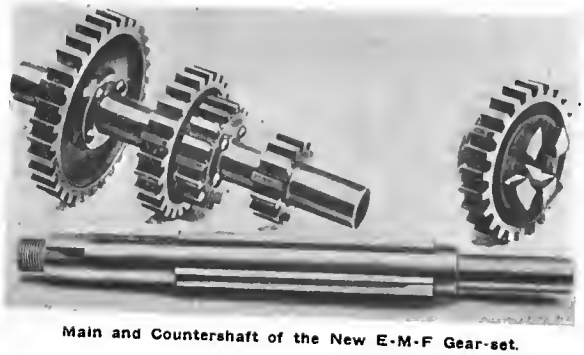
Details Have Come in for Painstaking Attention.

In going through the specifications it will be evident that while standard practice has been closely followed, it has not been slavishly adhered to, detailed refinement and improvement having been made wherever the designers thought it necessary. For instance, the valve guides are machined and pressed into place on the cylinders, instead of being cast integral with the latter, thus making it easy to replace them when worn. The valves themselves are very large, measuring 2 1-8 inches in diameter, and are drop-forged from special steel, both the stems and seats being accurately ground. In addition to providing ample sized valves, the inlet and exhaust passages have been made very large and unobstructed.

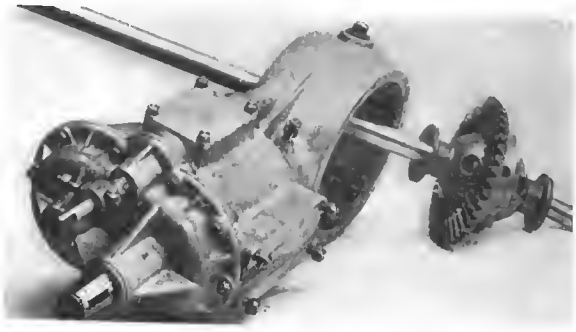


Working Side of Motor Showing Magneto and Lubricating Oil Reservoir.

The single camshaft of the new E-M-F "30" is made in one piece, with



Main and Countershaft of the New E-M-F Gear-set.



Aluminum Housing for Gear-set and Differential.

the cams integral, the piece being case-hardened after milling out the cam contours to machine finish, and the latter are then ground and "miked." That is, tested with a micrometer gauge reading to thousands of an inch, and it is by such painstaking care in the manufacture of the parts of a car that silent and efficient running is insured. The crankshaft is drop-forged from special steel, and is supported on three main bearings of babbitt, offset 3-4 inch from the center line of the cylinder, thus relieving the walls of the latter from excessive side strains. A flange, forged integral with the shaft, carries the flywheel. Connecting rods are steel drop-forgings of I-beam section, big ends being of the marine type, while phosphor bronze bearings are provided at the piston-pin end. Shims are provided for the adjustment of the die-cast babbitt crankpin bearings, and this may easily be effected through the large hand holes in the bottom of the crankcase. The latter are closed with sheet steel covers, in place of aluminum, as is usually the case. Five-inch pistons are used, fitted with four compression rings, both the piston and its rings being accurately ground to size. The hollow piston pin is a piece of case-hardened steel, and is also ground. All the moving parts of the motor are carefully balanced mechanically to reduce vibration to the lowest possible point.

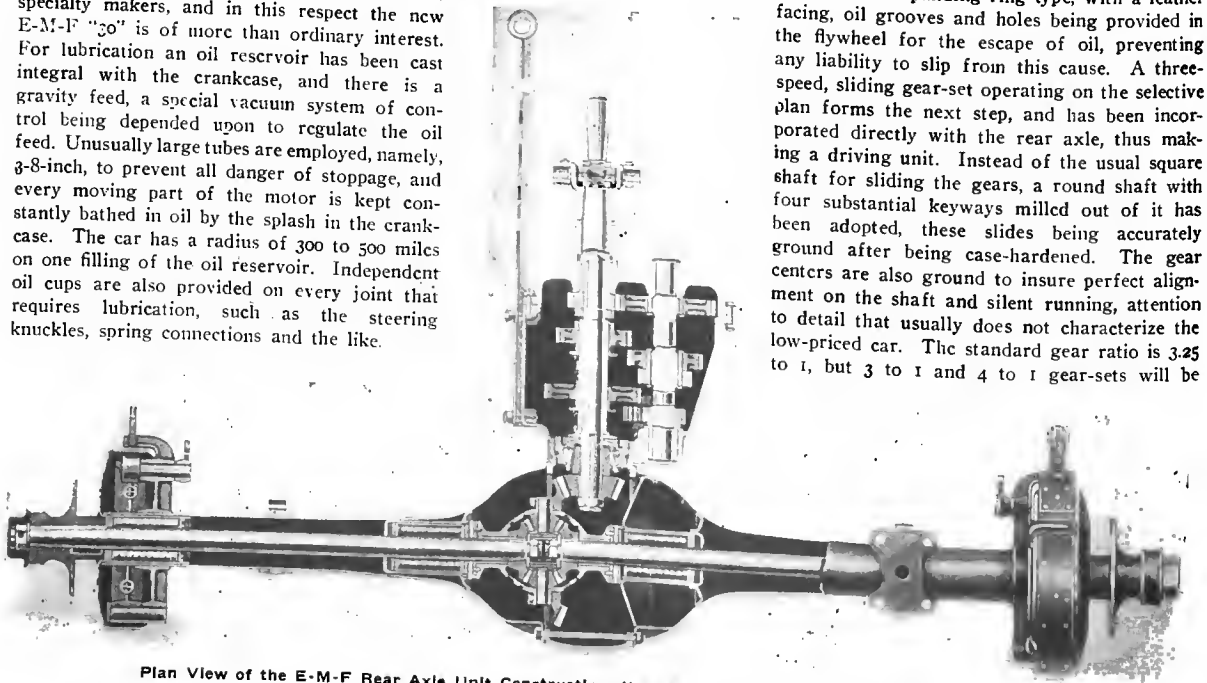
Motor Accessories Are of Interest.

It has been usual hitherto in placing a low-priced car on the market to purchase its accessories from the specialty makers, and in this respect the new E-M-F "30" is of more than ordinary interest. For lubrication an oil reservoir has been cast integral with the crankcase, and there is a gravity feed, a special vacuum system of control being depended upon to regulate the oil feed. Unusually large tubes are employed, namely, 3-8-inch, to prevent all danger of stoppage, and every moving part of the motor is kept constantly bathed in oil by the splash in the crankcase. The car has a radius of 300 to 500 miles on one filling of the oil reservoir. Independent oil cups are also provided on every joint that requires lubrication, such as the steering knuckles, spring connections and the like.

Doubtless the most unusual feature of a car to sell at such a low price is the fitting of a magneto as a part of the regular equipment, the makers stating that "it is as much a part of the E-M-F motor as are the valves." The magneto is a part of the design, and is permanently attached, the gears and all moving parts being enclosed in an oil-tight and dust-proof case. It is fitted so as to be readily removable for inspection. In addition to the magneto there is an emergency system of ignition, consisting of a quadruple unit dash coil, in the high-tension side of which an innovation has been made by connecting the leads through the back of the mahogany case and the dash directly to the plugs. The timer is an improved Lacoste type, mounted on a vertical shaft, and driven by bevel gears from the camshaft. Another feature of the motor to be commended is the separate housing of camshaft and magneto gears, lubrication being by non-fluid oil. Cooling is on the thermo-syphon principle, supplemented by a belt-driven fan consisting of a steel stamping, mounted directly on the motor, instead of being attached to the radiator; an eccentric belt adjustment is provided. The carbureter is a simple, single-jet design of the float-feed type, located in an accessible position on the off side of the motor and is an exclusive design that is turned out complete in the E-M-F plant.

Features of the Transmission System.

The clutch is an improved expanding ring type, with a leather facing, oil grooves and holes being provided in the flywheel for the escape of oil, preventing any liability to slip from this cause. A three-speed, sliding gear-set operating on the selective plan forms the next step, and has been incorporated directly with the rear axle, thus making a driving unit. Instead of the usual square shaft for sliding the gears, a round shaft with four substantial keyways milled out of it has been adopted, these slides being accurately ground after being case-hardened. The gear centers are also ground to insure perfect alignment on the shaft and silent running, attention to detail that usually does not characterize the low-priced car. The standard gear ratio is 3.25 to 1, but 3 to 1 and 4 to 1 gear-sets will be



Plan View of the E-M-F Rear Axle Unit Construction, the Main Housing Sections Being of Sheet Steel.

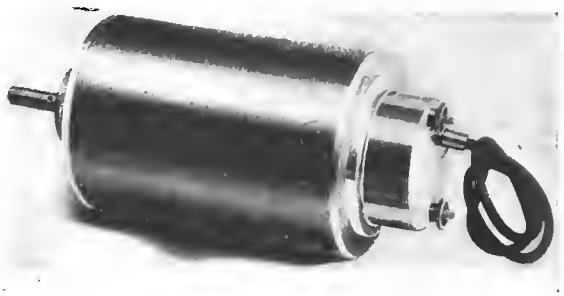
optional with the purchaser. The bevel driving gears have been made unusually large, both these and the sliding gears being turned out of a special alloy steel and accurately cut. Two universals are fitted on the propeller shaft. The differential is of the bevel gear type, something that has hitherto appeared only on the higher-priced cars, with but few exceptions. With the high gear ratio mentioned, the E-M-F is said to be capable of 50 miles an hour, or a range of from 4 to 50 miles on the high gear.

Details of the Chassis and Running Gear.

The rear axle is of the semi-floating type, and its design and construction form a chapter in themselves. Due to the use of drawn steel as the material and autogenous welding for putting the parts together, coupled with its design, this axle is said to weigh less than any other of its type on cars of similar weight and power, notwithstanding that the gear set is incorporated with it. The right and left sections of the housing are drawn from sheet steel and welded by the new process, Hyatt roller bearings in hardened and ground removable sleeves carrying the load. The thrust of the driving pinion is taken on a Timken roller bearing, while the differential thrust bearing is of babbitt between ground steel washers. All gears are in an oil bath, provision having been made to keep the housings oil-tight, and also to prevent oil running out of the axle ends when on an incline, so that the car should be free from dripping oil.

The forward axle is a one-piece drop forging of heat-treated steel, with the spring seats forged integral, the steering knuckles and connections also being drop forgings of steel. The steering gear is of the worm and sector type, these parts being made from specially hardened steel, while all surfaces are ground. The gear-shifting levers have been placed on the driver's right hand, as usual, but the control levers are on the steering pillar at the left and below the wheel, instead of on top, it being easy to operate them with the left hand, without releasing the wheel. An accelerator pedal is also provided. The left pedal operates the clutch and the right the service brake, the usual hand lever, with ratchet lock, being provided for the emergency. The brakes are centered on special drums on the driving wheels, the service brake consisting of camels-hair-lined steel bands, acting on the pressed steel drums, while tbe emergency brakes expand against the inner face of the same drums, and are of the metal-to-metal type, both sets being double-acting. Pressed steel discs enclose the drums, making them dust-proof.

The car is carried on semi-elliptic springs in front and full elliptics in the rear, unusually large springs being specified for the car's weight. All driving strains and thrusts are taken by two radius rods. The frame is pressed steel of "U" section, the side members being perfectly straight throughout their whole length. Twelve-spoke artillery wheels are fitted, while 32 by 3 1-2-inch Morgan & Wright clincher tires on universal quick detachable rims form this part of the equipment. The makers of the new E-M-F, the title of which, by the way, coincides with the abbreviation for electro-motive-force, or *pushing power,* lay special stress on the grade of materials employed. The cylinders, pistons and exhaust manifold are of the best gray iron; intake manifold of brass, crankcase of aluminum, while the frame, gears, springs, axles and driving shafts are of special steels, heat-treated for the purpose in view.



Simplicity of the E-M-F "30" Magneto.

The wheelbase is 106 inches and the tread standard, while the weight of the car is 1,800 pounds. It is listed as a five-passenger touring car, a standard type runabout, single or double rumble roadster, or as a demi-tonneau, which is an E-M-F innovation, this making a smart-looking four-passenger car with detachable tonneau. With standard equipment, which includes a high-tension magneto, beside the usual outfit of lamps, horn, tools and the like, the E-M-F "30" lists at $1,200. It is licensed under the Selden patent, and is the lowest-priced car of its type in the licensed fold, and out of it as well.

In speaking of the new production, W. E. Metzger, secretary and sales manager of the company, states the interest created by the advent of the new car is unprecedented in his experience and the rivalry among dealers to obtain agencies is very keen. "In appointing agents," said Mr. Metzger, "I take into consideration: First, the reputation of the dealer for taking care of his customers. I believe that is the vital point. Then his financial standing. Third, whether he is willing to devote his entire efforts to pushing our product exclusively. I don't always make the last a condition, but it's a strong point in the applicant's favor. I have already signed up for some of the larger cities and I think the names of the concerns will be a surprise."

FRENCH MAKERS MAY NOW ACCEPT DISMOUNTABLE WHEELS

By W. F. BRADLEY.

PARIS, July 23.—Before the last of the racing cars had left Dieppe, the racing board of the French club had sent forth a notice calling its members together to consider what steps should be taken for the Grand Prix of 1909. The meeting, which is announced for next week, will have under consideration the regulations for the next annual event and will consider what offers of courses may have been made to it.

It is doubtful if any definite arrangements can be made until the international conference of Recognized Automobile Clubs has decided what rules shall be in vogue for next year, but it is possible for the French constructors to decide what they will support and to bring the matter up for decision at the first meeting of the European body. French constructors recognize that they have been beaten, some of them by the tire and rim element, others by defects in their over-speedy racers, and if early preparation can prevent a repetition of the disaster of July 7 the Frenchmen will certainly not be lacking.

Two possible changes present themselves: that the engine bore should be still further limited in order to reduce the speed to limits that tires can be reasonably expected to maintain, or to allow the use of dismountable wheels in order that it may be impossible for such accidents as happened to the Renault cars to again throw down an entire French team. The French sporting commission has a hankering after the highest speeds in order to impress the public; it will, therefore, hesitate to materially reduce the power of the cars. Some of its most prominent members have a deep-rooted objection to the use of the dismountable wire wheel, commonly seen on Brooklands track, and would not admit it except under strict necessity. But the necessity appears to have come in the last defeat. If dismountable wire wheels, therefore, or a change of wooden wheels under exceptional circumstances can save the situation, they will be allowed.

It is of some interest to note that the dismountable wheel, which is invariably of the metallic variety, originated in England, and since the opening of Brooklands track has been very prominently employed there for racing cars, the change of a complete wheel being effected in considerably less time than is necessary for the dismounting and remounting of a ready inflated tire and rim. As the hub of the wheel was never changed, only the outer shell being taken away, fastening being by means of a single key, the English claimed that the device should be admitted in the French race. To this, however, the racing board would never agree, maintaining that the wheel was a part of the car and as such should be rendered unchangeable.

Now that they have suffered defeat, very largely through their refusal to allow the changing of wheels, there is a sudden change of opinion, many of those in authority being willing to allow the use of the British device. It is never safe to prophesy, but the chances are that next year instead of rims it will be wheels that are changed, and one element of chance will thus be eliminated.

Dieppe has about one chance in fifty of again being the scene of a Grand Prix race. The district will certainly put in its claims and they will be considered by the club, together with probably fifty others; but as there is now no special love for the scene of their defeat, and as innumerable difficulties have arisen with the authorities on the question of roads and general organization, it is more than probable that a new site will be chosen for 1909. Happily there are so many of them in France that it is not merely a question of picking a good set of roads, but also of discovering which district can give the largest indemnity and assist most powerfully in the organization of the contest. The receipts this year were $100,000, and expenses $72,000, leaving $28,000 profit. Anjou is spoken of as a favored bidder for next year, but as yet, trying to name the course is mere quesswork.

FRENCH AUTOMOBILE EXPORTS SHOW A BIG SHRINKAGE

PARIS, July 23.—On the first six months of 1908 French automobile exports show a shrinkage of $1,882,600 compared with the corresponding period of 1907. The amount of business done with foreign countries is also slightly less than during the first half of 1906, but is considerably better than during January-June, 1905. Thirteen nations are on the French trading account, and of these eleven have reduced the amount of their orders during the period for which returns have just been made. Russia has increased her orders for French cars 257 per cent., and the colony of Algeria has also shown a considerable awakening. England, the most important customer of France, has cut down the value of her imports of French cars during this half year to the extent of $354,000. The loss here, however, is not great and can be accounted for by the general financial depression, the trading account with Britain still being better than in 1906 and 1905.

During the first half of 1906 the trading account with the United States was more than doubled. Since then, however, there has been a steady decline, 1907 showing a drop of $98,800 and 1908 a further decrease of $97,480, making a total fall over the period of two years of $196,280. During the first half of 1905 the French automobile bill stood at $558,600; the one for the current half year totals $991,400.

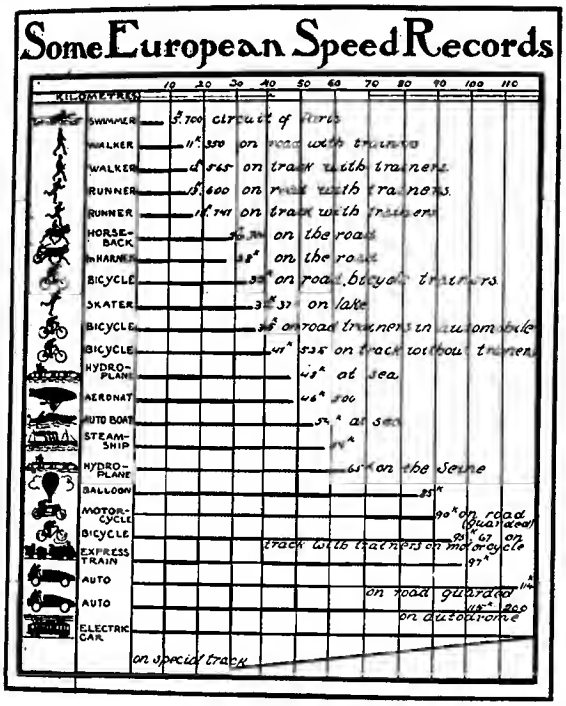
With Italy, Switzerland, Belgium and Germany the amount of business has dropped off considerably, and is not likely to be regained with either Germany or Italy. Spain may improve, and the whole of South America is looked upon as a field with considerable promise. The following table shows the amount of business done with the thirteen most important countries the initial six months of 1908 and 1907. The total does not accurately represent the French automobile exports, there being a number of other countries having small trading accounts which are grouped in the government report and are not included here.

Countries Showing an Increase.		
Russia	$166,600	$402,800
Algeria	352,800	467,600
Countries Showing a Decrease.		
Great Britain	$6,664,000	$6,210,000
Germany	1,741,200	1,372,000
Belgium	1,676,600	1,087,200
United States	1,088,800	991,400
Argentine Republic	660,600	491,400
Italy	441,000	236,800
Spain	419,600	372,400
Switzerland	417,600	205,800
Brazil	405,600	250,200
Austria Hungary	99,200	44,000
Turkey	10,800	10,000
Total	$14,034,400	$12,150,600

BLERIOT TAKES A TUMBLE.

Louis Bleriot, the French navigator, suffered his fourth or fifth smashup July 23 while making a trial of his new monoplane. Bleriot made several short flights that morning on the Issy les Moulineux grounds, and being apparently unsatisfied removed the machine to the shed. Practically all the spectators had left the field when he reappeared again at noon. He made a quick start and was soon well up in the air, traveling at about fifty kilometers an hour. Then, just after the first turn, a sudden gust of air twisted the tail of the machine skyward and Bleriot found himself sitting on the ground in a heap of wreckage.

The propeller of the machine was completely destroyed, the wheels damaged beyond repair, and the left wing crumpled into a shapeless mass. In fact, the tail was about the only part which did not show the effects of the tumble. Bleriot himself escaped without personal injury.



SPEED is a relative and mystifying thing. It is also a fascinating thing, else why the emotions which we all experience at a race of any sort, whether on land or water.

The late W. E. Henley sang a song of speed as a result of one of the too infrequent journeys which he had taken en auto, and Maurice Maeterlinck praised "the wonderful unknown beast" for its attributes as a conquerer of space.

The automobilist is generally decried—by those who are not themselves automobilists—as a speed fiend who drives to the common danger of all other classes of humanity, in all places and at all times. This idea is a fallacy, as is proved by the figures recently evolved by the Royal Automobile Club of Great Britain.

They sought to prove that a ten-mile-an-hour limit for automobiles was ridiculous when a horse-drawn omnibus was allowed to roll and career madly through London streets at 11.3 miles per hour, a cyclist at the rate of 15.85 miles, a private trap at 13.55 miles, and butcher's and baker's boys in their nerve-racking, rattling carts at any speed they could attain, frequently fifteen, sixteen, or even eighteen miles an hour.

The automobilist can get up speed when he wants to, but first, last and all the time he has his mechanical horse under better control than are the sorry hacks who draw the hansoms on the Thames embankment at fifteen miles an hour, or the electric trams which run out through Battersea or Hounslow at twenty miles an hour or more.

The fact that the automobile is as speedy a vehicle as it is speaks well for its controllability; otherwise, we should all have met untimely deaths before now. The opponents of automobilism seem to forget that there is often as much danger for the occupants of the automobile, when it arrives in a tight place, as for those on the road or footpath, or in another vehicle.

The comparative speed table reproduced herewith reduces the speed of modern locomotion in Europe to a common denominator, and should prove interesting to students of that all-important present-day question of roads and road-making and all that is thereto allied, and the question of speed and its relation to the needs of our modern life is a very potent one.

In a dozen years *"la vitesse"* in most forms of locomotion has been sensibly increased, and though the figures given are of European recorded records the comparisons hold equally good when viewed from either side of the big duck pond between us.

Billington, an Englishman, swam the Seine as it flows down through the very heart of Paris at a speed of 5.700 kilometers an hour, a water record that has not been approached.

Fantou, a Frenchman, made the circuit of Paris by road, on foot, walking, 36.600 kilometers in all, at an average gait of 11.350 kilometers an hour. Fantou also holds the European track-walking record of 12.565 kilometers an hour.

Loys, a Greek, ran 13.600 kilometers in an hour on the road—with trainers, and Schrubb, an Englishman, did 18.741 kilometers in the hour on the track, with trainers.

On horseback the record is 26.700 kilometers. It was made by Jobourg, mounted by the Marèchal de Logis, Peyraud, who also covered 100 kilometers—Brussels-Ostend—in 4 hours 15 minutes, an average of 23.500 kilometers an hour.

In harness, Prince, belonging to and conducted by A. Roy, made 28 kilometers in the hour, on the road between Nangis and Verneuil-l'Etang, near Paris.

Garin, a Frenchman, did 32 kilometers an hour on the road with bicycle trainers.

Troning, a Norwegian, comes next in point of speed with 32.370 kilometers to his credit, a skating record made on the ice of the lake at Davos, Switzerland.

The road bicycle record, paced by an automobile, 35 kilometers an hour, was made by Huret, a Frenchman, on the Paris-Bordeaux road, 594 kilometers being covered in 16:35.

The bicycle track record, without trainers, belongs to Berthet, 41.525 kilometers. This beats Petit-Breton's record of 41.110 kilometers.

The hydroplane record (a *bateau-glisseur* which just skims the surface of the water, its power coming from a gasoline motor) the invention of Comte de Lambert, is 48 kilometers an hour, made off the coast. In the sheltered waters of the Seine below Paris a speed which worked out at 63 kilometers an hour was attained for a short distance.

The aeronaut or dirigible balloon record for the hour seems still to rest with Count Zepplin's airship, Zepplin, 350 kilometers in 7 hours 30 minutes. This equals 46 kilometers an hour.

The motor boat record, that of the Lorraine-Dietrich belonging to Perigon, is 54 kilometers. It was made in Normandy.

The passenger-carrying steamship record belongs to the *Viper*, a cross-channel boat between England and France; 32 knots in the hour, equalling 59 kilometers.

The balloon record for speed is undoubtedly that made by the Hirondelle in 1887, when the formidable *vitesse* of 145 kilometers an hour was attained between Saint-Denis and Neuilly-Saint-Front. Eighty-five kilometers were covered in 35 minutes.

The motor-cycle record, on a road guarded by national troops, is held by Bucquet, 202 kilometers in 2 hours 12 minutes, the equal of 90 kilometers an hour.

The bicycle track record, paced by motorcycles, belongs to the Frenchman, Guignard, 95.67 kilometers in the hour.

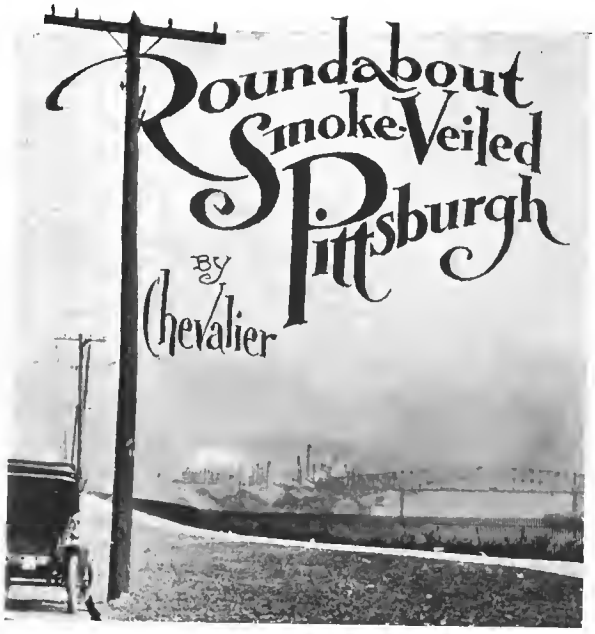
The express train record is that of the run from the Paris Gare du Nord to Amiens (the Paris-Calais Rapide). The 131 kilometers take 1 hour 35 minutes, or 131 kilometers an hour.

Automobile records in general are apt to be things of dispute these days, but the following are unquestionable recorded times, which may or may not be records in the light of the personal knowledge of other phenomenal, if seemingly fantastic, results achieved by the modern speed king, the automobile. In the Grand Prix race of 1907, on the Seine-Inferieur circuit, Nazzaro on a Fiat averaged 114 kilometers an hour for the entire distance. On June 9, 1908, the same driver and car went over to England in answer to S. F. Edge's challenge and set up a record for the Brooklands track of 120 miles—184 kilometers—an hour, over a total distance of 271-2 miles. Nazzaro deserves additional credit for this performance on account of his unfamiliarity with the course and the necessity of carrying a mechanician.

The Siemens-Halske electric car, on a section of specially laid track between Berlin and Jossen, made 210 kilometers an hour.

Roundabout Smoke-Veiled Pittsburgh

By Chevalier



A Haze of Smoke Obscured Our View of the City.

READERS of Daudet will remember that Tartarin de Tarascon was made up of two diametrically opposed temperamental halves. He was a combination of Quixotic love for travels and adventure on the one hand, and Sancho Panzaic love for home and comfort on the other. Quixotic Tartarin would say to himself: "Sally forth into the world of adventure and cover yourself with glory." Sancho Tartarin would whisper: "Stay at home and cover yourself with flannel."

The writer confesses to a similar make-up. Maps are studied, road books are read, and a trip is laid out months in advance, with all the pleasures of anticipation.

When the time of departure arrives, Sancho has his innings, and a debate arises. What about changing tires in the mud and rain? What if we should get "hung up" in the mountains with major mechanical troubles or with a leak in the gasoline system? What about having to sleep out in the machine on the mountain? Would it not be more comfortable to sit under the shade of our own big white oak, and read and doze? Usually the Quixotic half comes out ahead, and we pack our luggage in the hamper, fill the lunch basket, and we are off.

But once a compromise was struck between the Sancho and the Quixote halves, and the trip over the rough and rugged roads of the Allegheny mountains was abandoned for a delightful little run around near by, where "home, sweet home," can be reached quickly, whether the machine is willing or not.

Passing through Bellevue, where property is worth $300 a foot, and where the streets are so bad that your teeth are almost shaken out of your head, we cross the Allegheny river, and wend our way through the grime-laden atmosphere of Pittsburg. We pass the Carnegie Institute, and take off our caps and bow to the genius of the man who can earn a million dollars a week while playing golf four thousand miles away. We pass over the smooth roads of Schenley Park, whose beautiful green grass and foliage are turned brown, and, in some places, black, by the grimy, brown, ore-laden atmosphere, polluted by the mills which have made Pittsburg. We speed on, that we may the sooner rid our lungs of the filthy atmosphere, and fill them with the pure air of the open country.

We keep the speedometer right up to the legal point. If it passes it, it is because of the vibration of the machine. We hurry through Highland Park, over the Allegheny river, and, taking the Evergreen road, we are soon among the beautiful hills and fields of Western Pennsylvania. We then turn into the Perrysville plank road, and, going east, we turn down into the Lowries run road. We bowl along, coasting over this smooth, newly improved highway, and our Quixotic half has his innings. Is this not better than sitting at home reading about some other fellow's trip?

When we get to the next hill, however, some misgivings arise. Our power is nearly gone. The vehicle is not running hard, for it just coasted beautifully, even on the less steep portion of the down grade. The motor does not seem to be skipping, and, to make sure, as well as to see if the muffler is choked, we open the cut-out. There is no skipping, the explosions are very weak, and cutting out does not increase the power. The gasoline valve on the carbureter is opened and closed slightly without any effect. The dry cells and storage battery both are in good condition, and both give equal results. The valves are tight, their lift is right, and the compression is good and equal.

Here is a bad state of affairs. We are on a valley road, in a pocket, to get out of which it is necessary to climb some steep hills. We must fix things or abandon the machine and "hike" five miles in the blazing hot sun. Sancho Panza says: "I told you so." We sweat for an hour trying to locate the trouble, and then sit down to think and reason, and to allow the motor and ourselves to cool off. We now do what we should have done in the first place—make a diagnosis.

We have made the same blunder that is made in most repair shops, where they take a machine all apart to find the trouble, instead of reasoning out the probable source of the difficulty. They do an exploratory operation instead of making a diagnosis. We reason that the weak explosions heard when the muffler was cut out could not have been from faulty carburetion or there would have been at least an occasional skip. Could there be an obstruction in the exhaust pipe? The symptoms were so like a choked muffler, except the failure to cure by the opening of the cut-out.

By this time the exhaust pipe is cool, and when we take it apart and find a piece of a baffle plate choking it up almost completely, we remember that after coasting that last hill we had a terrific explosion in the muffler because we failed to close the throttle when we shut off the spark.

We connect up the exhaust pipe, wash off the grease and dirt in the stream, brush our clothes, start the motor, and hear with

After We Left the Din and Grime of the Iron Mills.

A Pennsylvania Oil Producer's Home and Derrick.

Shagbark Cottage Which Delighted Sancho Panza.

joy the deafening cannonading of the cut-out explosions. Never was noise more musical to the trained automobile car than that.

We bowl along through the valley, crossing and recrossing the brook. We come to a sudden ending of our smooth macadam, and bump along over the rough clay, just dried after recent rains. It is one of the galling things to a Western Pennsylvania autoist that all good roads lead to bad ones. Allegheny county has been improving roads in patches here and there, so that only a few continuous miles are yet available.

Soon we come to something worse. The Telford foundation has been laid, sharp stones on edges, but the top layers of broken stone have not been added. This is ruinous to tires, but, hoping it will end at every turn, we keep on, still thinking that it is a farther escape backward than forward. After four miles have been traversed, we come to an utterly impassable road. We think of the four bad miles behind us and no extra casing along. Sancho Panza says: "I told you so." Fortunately, we discover a side road, which we take, over steep hills, through muddy, swampy, shaded valleys, where the sun has not yet had time to dry out the roads.

We pass through old fields, where black old derricks a quarter of a century old, still stand, the wood preserved by the oil sprayed over the structure when the "gusher" was struck that made the owners wealthy at the rate of hundreds of dollars a day, a man's capital being figured in barrels of oil.

Soon we reach the Perrysville road, on which we turn homeward. After a good dinner, both Quixotic and Panzaic halves are satisfied by the pleasure of the summer afternoon's trip.

THE MICHIGAN CONSTABLE TRUST.

A party of amateur Sherlock Holmeses, while on an automobile tour through Michigan, succeeded in unearthing a copy of the rules in force among a certain band of constables operating there. By what devices and underhand methods it was obtained there is no need to relate. All autoists who intend to visit that State should read the rules and be prepared with the necessary equipment. They are:

1. On discovering an approaching team, the automobiliet must stop offside and cover his machine with a tarpaulin painted to correspond with the scenery.
2. The speed limit on country roade thie season will be secret snd the penalty for violation will be $10 for every mile an offender is caught going in excess of it.
3. In case an automobile makes a team run away, the penalty will be $50 for the first mile, $100 for the second mile, $200 for the third mile, etc., that the team runs, in addition to the usual charges for dsmsges.
4. On approaching a corner where he cannot command a view of ths road ahead, the automobiliist must stop not less than 100 yards from the turn, toot his horn, ring a bell, fire a revolver, hailoo, and send up three bombe at intervals of five minutes.
5. Automobiles must be seasonably painted—that ie, so they will sgree with the pastoral ensemble and not be startling. They must be green in spring, golden in summer, red in autumn, and white in winter.
6. Automobiles running on country roads at night must send up a red rocket every mile and wait ten minutes for the road to clear. They may then proceed carefully, blowing their horns and shooting Roman candles.
7. In case an automobile comes up behind and wants to pass, the farmer will affect deafness until the autoist calls him a hard name, and will then enter suit for defamation of character.
8. All members of eociety will give up Sunday to chasing automobiles, shooting and shouting at them, making arrests, and otherwise discouraging country touring on that day.
9. In case a horse will not paes an automobile, in spite of the scenic tarpaulin, the automobilist will take the machine apart as rapidly as possible and conceal the parts in the grass.
10. In case an automobile approaches a farmer's house when the roads sre dusty it will slow down to one mile an hour and the chauffeur will lay the dust in front of the house with a hand sprinkler worked over the dashboard.

LEGAL DECISIONS OF IMPORTANCE.

NEW YORK, July 27.—Two decisions that have been handed down during the past week or so by the courts in this jurisdiction are of considerable interest and importance to automobilists at large. Probably the one that will come in for the greatest commendation was the sentencing of Charles McLeod, a Brooklyn chauffeur, to six months in the penitentiary by Judge Norman S. Dike, for what is most familiarly known as "joy riding." It happened to be the second occasion on which McLeod had taken a machine from the garage at which he worked for the purpose of showing some of his friends how fast he could drive, and in each instance he ended by demolishing the car. He pleaded guilty to grand larceny in the second degree.

The second decision is by the Appellate Division of the Supreme Court, and is to the effect that the owner of an automobile is not responsible for damages inflicted by it upon a third party when in the hands of his servant for the latter's personal convenience. This was rendered in the case of Cunningham *vs.* Castle, which was an action brought to recover damages for injuries sustained by being run down by the defendant's automobile while under control of the driver, Henry Boes, for his own purposes. In the lower court the jury found for the complainant, but the Appellate Division reversed this and ordered a new trial, Justices Clarke, Ingraham and Scott concurring, while Justices Houghton and McLaughlin dissented.

TOLLS DOUBLED ON A MARYLAND TURNPIKE.

BALTIMORE, July 27.—The toll charge for automobiles has been doubled by the Frederick and Jefferson Turnpike Company, whose road runs between the city of Frederick and the village of Jefferson. This road is one of the best-kept highways in the country and the officials claim that the autos cause great harm to the pikes. The advanced rate will make the charge for two-seated autos 32 cents. The road is eight miles long, so that the cost per mile will be four cents.

A TOUR THAT UNDENIABLY DEMONSTRATED.

When 28 automobiles out of 46 can travel 1,675 miles in 12 days, observing a schedule that demanded much over roads fluctuating suddenly from excellent to vile, and receive attention from driver and mechanic limited to the use of parts carried on the vehicle, the percentage of clean-score finishers supplies a demonstration of the American automobile that should be acceptable even to those few skeptics who have been waiting for public proof that the new means of individual transport had reached that stage of perfection which would commend it to all as reliable and assured for short and long hauls.

Surely even the most exacting could not ask anything more convincing than what was accomplished by the automobiles participating in the "fifth annual reliability touring contest" of the American Automobile Association, and it should be here mentioned that, besides the perfect-score brigade, the survivors of the hardest test ever asked of motor-driven vehicles, either here or abroad, included others which fell short of a clean-score record by margins so scant that they are entitled to almost equal credit. When one adds a half dozen official and press cars which practically duplicated what had been done by the contestants, the reliability showing gains more in the fullness of the measure.

Automobile endurance runs are sporting propositions only in a minor sense, and the general public is mainly interested in being informed as to what cars have met the extraordinary touring conditions called for. If more than one car answers these requirements, the interest of the automobile-buying public is that much increased, for the greater number of clean-score participants—providing the contest is one really deserving of the name—makes evident the reliability of automobiles as now produced.

It is a fact, however, that a certain percentage of the public are particularly interested in any sort of a contest, human or mechanical, or combining both, and to satisfy these it may or may not be advisable, according to the viewpoint, to continue an automobile endurance run until a winner is evolved for any trophy which may be offered.

If independent owners, for their own sporting amusement, were the only entrants in automobile contests of a reliability nature, and insistent upon a fight to a finish, a single winner would be a natural sequence. But it is the makers themselves who now pay the heavy bills, and, having met the extraordinary touring conditions by participating in a reliability contest, they are entitled to a reasonable amount of unquestioned publicity for having successfully passed the hard mechanical examination.

Therefore, while it might be a matter of interest in some quarters, it would seem that it really mattered little whether or not the tie was decided in the matter of holding the Glidden trophy, for, if no club team won it, it naturally reverted to the A. A. A. touring board, to be held until the contest of another year. To have penalized a car at the conclusion of the tour because it checked in a minute earlier than it was required to do would have been action somewhat unusual when all attendant circumstances explained elsewhere were taken into consideration. The most scrutinizing discoverer of technicalities might so rule, and he would find those who agreed with him. But a common-sense interpretation of the incident would not have blackened the otherwise faultless mechanical record of the car for such a palpable and indirect error in mathematics, which, if it gained nothing for the car, certainly should not have counted against it. It might be said, too, that a rule of this indefinite sort might better be left out of future conditions of endurance runs.

If winners must be had at the conclusion of endurance runs, they can be more sensibly obtained by an examination of the cars, letting general condition decide any ties which may exist.

The tour told a story full of praise for the endurance qualities of American automobiles, and a sporting sequel may or may not be a necessity, according to the manner in which one looks at the proposition as a whole.

It is now plainly apparent that the American automobile has risen superior to any prolonged contest conducted over American roads with due observance to the existing laws. And its ability thus demonstrated is greatly in excess of anything which it might be asked to perform in its use even by an owner who might demand much more than would the average autoist, who does not expect to utilize the highways as a race course.

Exactly what sort of a contest should be planned for next year is a matter requiring most careful consideration. It would seem a likely proposition that the tour of 1909 should be held somewhere in the center of these United States, where automobiling has not yet lost its recently gained newness, and where roads are scarcely such in name.

ASK FOR ROADS TO COMPLETE VANDERBILT CUP CIRCUIT

PROGRESS on the 12-mile stretch of the Long Island Motor Parkway, between Central Park and Meadow Brook, has so far advanced as to positively insure its completion for the Vanderbilt Cup race and justify the commission is going ahead in securing the use of the existing highways to complete the 30-mile circuit.

Accordingly, on Tuesday last A. R. Pardington, on behalf of the Vanderbilt Cup Commission, made to the Board of Supervisors of Nassau county formal application for permission for the use of about a score of miles of the county roads in the towns of Oyster Bay, Hempstead and North Hempstead for elimination trials between 5 and 10 o'clock on the morning of Saturday, October 10, and for the Vanderbilt race itself on Saturday, October 24, from 5 A.M. to 3 P.M.

The board has set Monday, August 3, at 10 o'clock in the morning, for a public hearing at the courthouse at Mineola. In view of the fact that permission has readily been granted for previous Vanderbilt races, and in the face of the undisputable eagerness of the Nassau county citizens for the running of the race, with its attendant liberal pouring of the fraternity's money into the county, there seems to be little doubt of the desired permission being granted. In its application, filed at Mineola, the Cup Commission outlines the course desired as follows:

Beginning at the Round Swamp road at or near the juncture with a road known as the Manetto Hill road to Plainview, thence on a straight road to Woodbury and east along the Woodbury road to a point or juncture of the Woodbury road with the Jericho turnpike, over the Jericho turnpike west to Jericho village, thence south from Jericho village, on the Massapequa-Oyster Bay road to its point of juncture with the Jericho turnpike, thence west over the Jericho turnpike to the old Westbury road, thence south to the Old Country road and easterly along the Old Country road to Merrick or Whale Neck avenue; thence along Merrick avenue to a point about 400 feet north of the Central branch of the Long Island Railroad to the roadway of the Long Island Motor Parkway.

Though entries for the Vanderbilt Cup race do not close until September 1, with the privilege of making nominations up to October 1, the commission has received ample assurance of a representative field of American contenders, and is confident of a sufficient number of competing foreign cars to preserve the international character of the race. Entries are now being made.

Robert Graves, a member of the commission, who has purchased the Mercedes which won this year's Grand Prix, has not yet made known his intentions as between substituting the newer car for Janatzy's Mercedes of the 1906 race already entered by him, or putting the Grand Prix winner in as an additional entry. A six-cylinder Mora has already been entered.

An announcement was made Tuesday of the entry of a special Chalmers-Detroit of 50-horsepower, it being entered in the name of J. S. Harrington, of the Worcester Automobile Club. The car will be driven by Oliver Light, who is well-known.

The nomination of two Locomobiles and two Thomas cars seems assured. There are also in circulation reports of intended entries of an Apperson, an Acme, a Chadwick, a Frayer-Miller and two more Chalmers-Detroits by their makers.

FRENCH CLUB AT WORK ALONE ON 1909 RACE RULES

PARIS, July 23.—The absence of two of its most prominent engineers, Louis Renault and Henri Brasier, was largely responsible for the Racing Board deferring its decision on the regulations for the 1909 Grand Prix at the meeting this week. The gathering of the Racing Board, the first since the Dieppe event, was occupied in talking over the situation for next year, but was not productive of any important decision. It was decided in principle, however, that there should be a race in 1909, thus putting an end to the rumors that, as the result of the recent defeat, the Grand Prix would be abandoned.

In all probability a decision regarding next year's regulations will be made within a week, the intention of the Commission Sportive being to announce the conditions and place of the race practically twelve months in advance, so that constructors will have an opportunity of preparing well ahead and of testing the actual racers on the course before it is closed for the necessary repairs prior to the race.

Regarding the rules to be adopted, there is complete confusion at the Commission Sportive. A still further limitation of the bore in order to reduce speed to the limit which tires can reasonably be hoped to maintain is strongly supported. On the other hand, M. Arnoult, the vice-president of the technical board of the club, declares in favor of full liberty, maintaining that the tire element alone is sufficient check upon exaggerated horsepower. The recent race is an argument in favor of M. Arnoult's theory, the fastest cars in the Grand Prix all being killed out as the result of tire trouble caused by their excessive speed.

There is something of an anomaly in the Racing Board of the French Club seeking to settle the rules of the race without any reference to the other members of the International Association of Recognized Automobile Clubs. The burlesqueness of the situation does not even escape the Frenchman, who asks why, after so strongly protesting the independent rules of the Vanderbilt race, the Commission Sportive should meet with the avowed purpose of drawing up rules for its 1909 speed test, which will not be in conformity with the decisions of the Ostend conference. Doubtless the Belgian decision of 1907 was only intended to apply to the races of 1908, but if it needed the combined clubs of Europe to formulate a set of rules for the present year, why should a single club usurp that power for 1909; the fact that it is anxious to make early arrangements is not sufficient excuse for the irregularity.

Despite the serious drubbing that the Dieppe district has received at the hands of the French club, the Norman authorities have boldly come forth with a request for the race to be held a third year in their district. The chances are that the request will be turned down without thanks. Drivers still remember that a few of their number had to spend a day in jail for exceeding a ridiculously low speed limit, and that others had to meet fines for exceeding 15 miles an hour with cars that could not be throttled down to such a crawl. The Racing Board is sore over the bad condition of the course and the stupidity shown in the tarring arrangements, while the treasurer is not likely soon to forget that the Prefect of the district demanded 734 free grandstand seats for himself and his friends, and thereby reduced the profits by $6,036.

There are half a dozen districts ready to make every sacrifice to secure the 1909 race, the favorite for the moment being the Anjou district, a few miles to the west of Tours, and on the border of the beautiful chateau country, well known by all foreign tourists. A strong argument in favor of the district is a subvention of $20,000.

Though all the accounts are not yet in, it is estimated that the recent race will leave a profit for the Racing Board equal if not greater than that of the 1907 event, despite the reduction of the town indemnity from $20,000 to $10,000.

The voiturette race of itself, though well attended, was not sufficient to make expenses.

BAD WEATHER MADE OSTEND MEET TIMES SLOW

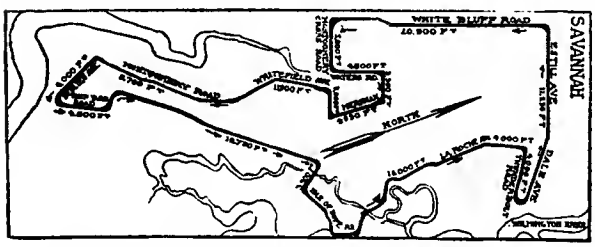
OSTEND, BELGIUM, July 23.—Rain spoiled the last day of the Ostend meet, which in the past has been famous for the breaking of records. When the powerful Grand Prix cars lined up for their fling at mile and kilometer distances the wind was blowing half a gale and the rain was descending in torrents, with the result, as can readily be supposed, that no record went by the board during the 1908 gathering. The Belgian method of making mile and kilometer tests is for the cars to cover the distance in both directions, the times being totalled and the average maintained as the official performance.

Hautvast, who handled the Bayard-Clement 155 millimeter machine which fell down on him in the Grand Prix, made the fastest time on the flying kilometer, his total time for the two tests being :45 2-5. Rigal, also on a Bayard-Clement, took second place with :46 4-5; Gabriel on the Grand Prix Mors was clocked in :49 2-5; S. F. Edge's six-cylinder Napier could not do better than :50 4-5, and De le Marra's Fiat finished in :55 1-5.

For the mile test, standing start, Hautvast again scored, his Bayard-Clement covering the double distance in 1:33 4-5; Gabriel ran the Mors into second position with 1:39 3-5; Rigal got third place for the Bayard-Clement with 1:48, and De la Marra was again tail-ender on the Fiat with 1:59.

COURSE ANNOUNCED FOR SAVANNAH RACE.

The Automobile Club of America has definitely announced at Savannah, Ga., the course for its "Grand Prize of America," and work has been started to prepare it for the race. The course is 26.73 miles long, and will be covered fifteen times, making a total distance of 400.85 miles. While the road surface is undoubtedly excellent, no record-breaking speed can be expected on account of the great number of turns. There are at least a dozen right-angled corners, and two or three even sharper; the longest straightaway stretch is about two and a half miles. An elimination race may be held three days before the main event, as the A. C. A. officials expect will be necessary, and a proposed 200-mile light car race is talked of the day before.



Route of "Grand Prize of America" Course at Savannah.

The course will be patrolled by State militia and a detail of police, and if these repeat their good work of last year there should be no trouble from the crowds. The present grandstand holding 8,000 persons will be enlarged, with ample parking space nearby. All information concerning hotels and boarding-houses will be furnished through a special bureau.

AERONAUT FARMAN ARRIVES IN NEW YORK.

When the *Touraine* steamed into New York harbor last Sunday morning with Henry Farman on board it was met by an enthusiastic delegation from the Aero Club of America, who transferred the aviator to their tugboat and escorted him to the Hotel Astor. Later in the day Mr. Farman went out to the Brighton Beach race track, where the flying exhibitions will begin August 1, and looked over the ground. He seemed very much pleased, but took occasion to warn his companions not to expect him to fly away over the housetops or soar into the clouds, for developments had not reached that as yet.

"We must remember," said Farman, "that there is a great difference between the aeroplane and the dirigible balloon. At present the latter has the best of it, at least from the spectacular side, but there is no doubt that the aeroplane will prove far superior as its development progresses. I always go upon the principle, however, that it is better to be a live experimenter than a dead dare-devil." Farman's machines arrived on the *Kroonland* and were immediately transferred to Brighton Beach, where they will be set up at once.

RACE PROMOTERS CASH A $7,000 RAIN BET.

It will be remembered that the coterie of multi-millionaire racing enthusiasts summering at Long Branch resolved to take no chances of unfavorable weather making the meet they promoted at Elkwood Park, on the Fourth of July, a financial failure, hit upon the expedient of insuring themselves against a storm on that day. Accordingly, by the payment of $1,400 premium, they secured at the Lloyds', in London, insurance to the amount of $7,000 against one-tenth of an inch rainfall on that day. The promoters were easy winners of the 5 to 1 bet.

The Vanderbilt Cup Commission has invariably insured itself against damage suits, and similar insurance was taken out by the Briarcliff race promoters.

In view of the outcome of the precaution taken by the Long Branch race givers, it is not at all unlikely that in future many of the big automobile events will be thus insured against financial loss. Race promoters, grandstand builders and other holders of privileges will probably seek the Lloyds to make their good things sure things.

INDIANA'S GOVERNOR IS CONSERVATIVE.

INDIANAPOLIS, IND., July 27.—The rumor reached here last week that Indianapolis is in a fair way to get the American automobile derby to be run under the auspices of the Chicago Automobile Club. The only thing in the way, it is said, to prevent the State from getting the race would be the refusal of Governor J. Frank Hanly to lend the services of the State troops to police the course. The Governor has been on a lecture tour for several days and has not been seen on the subject so far. However, it is believed that he would not consent to the State troops aiding such a race, as he is decidedly conservative.

It is reported that a 26-mile course in the vicinity of Crown Point in the northern part of Indiana has been decided upon, and it would be necessary to have the military forces patrol the course to prevent accidents to spectators.

CALDWELL, VANDERBILT PUBLICITY MAN.

Henry Caldwell, whose "Gasoline Gossip" column in the New York *Evening Telegram* attracted widespread notice during its printing, has taken charge of the publicity department of the Vanderbilt Cup race, which means that the work will be exceptionally well done and satisfactory generally to all newspaper men. Mr. Caldwell's office will be at 437 Fifth avenue, New York City, in a room added to the A. A. A. headquarters.

MARYLAND STARTS ROAD IMPROVEMENT WORK.

BALTIMORE, MD., July 27.—Routes for improved highways in Calvert and St. Mary's counties, in southern Maryland, have been selected by the Good Roads Commission. This is the first move for the construction of the system of State roads for which $5,000,000 was appropriated by the Maryland legislature.

THINGS DOING AMONG THE AUTO CLUBS

ATLANTIC CITY CLUB FLAGS THE FLAGGERS.

ATLANTIC CITY, N. J., July 27.—Automobile travelers approaching this city, from whatever direction, will find the roads patrolled by county constables. To offset these pests, the Atlantic City Automobile Club has established counter-patrols, each man armed with a huge yellow flag bearing the emblem in black letters, "Police trap ahead—slow down." The business of the yellow flagmen will be to locate the traps and station themselves accordingly—moving from place to place with the Vidocqs and checkmating them at all times. The yellow-flaggers have been on duty but a few days, yet in that short time they have done excellent work—so excellent, in fact, that they have aroused the ire of the constables, who threaten to nab them if they interfere with their legitimate prey. So bitter has the feeling of the cops become that they threaten to even cause the arrest of the Atlantic City club officials on the charge of obstructing justice and abetting violations of the law. Certain it is that the arrests of automobilists during the past week have practically ceased.

A number of Chelsea cottagers, whose business takes them to Philadelphia every day, have organized an exclusive motor club which they call the "D-T Association." (They are kept constantly busy explaining that the initials stand for "Daily Trips" and not "Delirium Tremens.") The "D-T's" go to and from business each day in their cars instead of patronizing the railroad's flyers and find the scheme highly enjoyable. Traveling together, any breakdown likely to result in delay is discounted by the owner getting into another car and leaving his own car in charge of a chauffeur, who, after fixing the car or getting it fixed, brings it on to its destination, where its owner finds it ready for him.

ARREST OF A CLUB'S SPAGHETTI SCATTERER.

COATESVILLE, PA., July 27.—But eleven of the expected half a hundred cars participated in last Saturday's endurance run of the Automobile Club of Chester County, because of a dispiriting all-day downpour. The course was to Oxford and return—about 80 miles—and the roads were hub-deep in many places. The competitive feature of the affair was practically abandoned, and the run home degenerated into a flounder, which resulted in a pair of Buicks—John Boyd's and Dr. H. S. Scott's—finishing first and second, with J. H. Maynard's Ford third.

The contestants were hot over the arrest of the pilot, Walter L. W. Jones, in West Chester, for scattering confetti at the turns. The cleanly officials asserted that Jones had "cluttered up the streets with his d——d paper," and the culprit was mulcted a five spot by Burgess Reid. Jones stripped off a twenty from a fat roll, and the burgess had to run all over town to get it changed. The run was almost on his heels when he got away.

JERSEY CLUB WILL RACE AND PROTEST LAW.

WILDWOOD-BY-THE-SEA, N. J., July 27.—There will be a great gathering of automobilists here on Friday evening, July 31, to protest against the many injustices of the New Jersey motor law. The affair will be under the auspices of the Motor Club of Wildwood, and the date was selected on account of the great influx of motorists expected here to witness the "sprint" races on the Central avenue boulevard the following afternoon. The meeting will be the first gun in a strenuous campaign of the motor clubs and hotel keepers against the Frelinghuysen law, which, while proving decidedly obnoxious to motorists, especially those from outside the State, has taken thousands of dollars from the pockets of the seashore bonifaces, who complain that automobile travel has fallen off 50 per cent., as compared with last year—this, notwithstanding that with the marvelous growth of the sport elsewhere, a 50 per cent. increase could have been otherwise looked for.

The three Philadelphia clubs are taking a lively interest in the meeting, and are endeavoring to secure a big turnout of their members. "Charlie" Swayne, former president of the Quaker City Motor Club, now lives here, and has guaranteed a big representation of his clubmates. The Philadelphia and Germantown clubs will also be largely represented, while there will be delegates not only from every automobile organization in southern New Jersey, but from every club within fifty miles of Philadelphia. Northern New Jersey and New York have also been invited to send representatives.

The Wildwood protest, it is understood, will be followed up in September by a similar meeting in Atlantic City, under the auspices of the Automobile Club and the Hotel Men's Association of that resort. To the latter gathering every club in the New Jersey federation will be invited to send delegates. It cannot be denied that the Frelinghuysen law has kept automobile tourists out of the State. It is apparent to everyone in any way connected with the business in the south Jersey shore resorts.

Next Saturday's races—the affair is officially termed "The Midsummer Meet"—promises to be even more successful than those held on the glorious Fourth. The numerous events elsewhere kept down the entry list on that occasion.

Third Annual Outing Given by the Ontario Motor League to the Orphan Children of Toronto, Friday, July 10.

ANOTHER CLUB IN WESTERN NEW YORK.

BATAVIA, N. Y., July 27.—The autoists of this city have organized a club and elected the following officers: President, Arthur G. Hough; vice-president, Raymond M. Walker; secretary and treasurer, E. Dean Hickox; executive committee, the officers and Charles Shaul, W. W. Kinne and J. W. Leseur. Nearly fifty business and professional men stand ready to join and a meeting will soon be held to complete the organization.

AUTOMOBILE INTEREST AROUND MASON AND DIXON'S LINE

By F. S. SLY, Traveling Correspondent for the Automobile.

ROANOKE, Va., July 25.—Roads in this part of Virginia are only fair, but Roanoke lies within four miles of the through road leading from Hagerstown, Md., to Bristol, Tenn., a stretch of macadam that is fully 300 miles long, so that autoists are not at a loss for a stamping ground. It is evident that interest in automobiling is growing apace here, as the Roanoke Automobile Association has just been organized with J. H. Marsteller as president, and C. M. Arms, as secretary and treasurer, and as there are now about 75 resident owners of machines in the city, the association will have plenty of material to draw on for its charter membership. While the through road not only offers a long stretch for pleasure runs, but also serves as a convenient connecting link between many small places in this part of the State, it does not naturally take the place of the network of good roads between places of importance and out in the open, that every part of this country should be able to boast, so that the new association will begin to make its influence felt in this direction as soon as it gets under way.

Dealers here report that business has been good during the present season, and still continues so, buying in this part of the country not being confined to the opening of the fair weather season by any means. There are two good garages, the Virginia Motor Car Company, representing the Maxwell, operating one, while the Roanoke Automobile Company, which handles the Rambler, Ford and Buick, runs the other. In addition to these, J. F. Munger & Son represent the Reo.

Harrisburg a Strong Automobiling Center.

HARRISBURG, PA., July 28.—For its size, this city can well lay claim to being one of the best populated in the East, from the automobile point of view, there being about 500 cars in use here. This, in spite of the fact that there are but few good macadam roads in the county, the only ones of importance being those leading to Reading and to Gettysburg, both of which are very popular runs. The remainder of the roads roundabout are only fair and offer but small inducement to the autoist who does not have to use them from necessity or convenience. The chief factor in the fostering of automobile interest here is the Harrisburg Motor Club, of which Vance C. McCormick is president, J. C. Michener, treasurer, and J. Sidney Sible, secretary..

American Mors taxicabs have been introduced here, six of these cars now plying regularly for hire, while it is noticeable that a number of the city's business houses have gone in for commercial vehicles, as quite a few automobile trucks of various sizes and styles are to be noted in service. There are several up-to-date garages and quite a number of well-known American cars are represented, the Harrisburg Auto Company handling the Rambler, Ford, Reo, White, Peerless, Stoddard-Dayton and Stanley, while the Central Pennsylvania Auto Company has the Cadillac and the Buick, and the Keystone Motor Company represents the Pullman, Jackson and Atlas. All of the above maintain garages, while Andrew Redmond does an agency business, handling the Maxwell and the Columbus electrics. Business is reported as good by all the dealers, but not quite up to the mark set by last year, which was the best the trade here has had.

Nation's Battle-ground a Place of Fine Roads.

GETTYSBUGG, PA., July 27.—There are few more attractive places to the autoist than the National Park here, not only from its historic and scenic interest, but from its network of fine macadam roads over which the visitor can easily reach all of the prominent features of the far-stretching battle-ground over which the most decisive encounter of the Civil War was fought. Autoists who tour anywhere in Pennsylvania within striking distance of Gettysburg seldom fail to make a detour to take in the sights of the battle-field with its endless monuments and tablets erected to commemorate the valor of those who gave up their lives in the three-day fight, and it goes without saying that this number would be vastly increased could the field be reached by good roads from any point of the compass. The Lincoln Memorial road, now in course of construction and which will connect Gettysburg with Washington, should be the cause of bringing a large number of visitors from the National Capital.

Flourishing Clubs in Small Pennsylvania Cities.

WILLIAMSPORT, PA., July 27.—There are only a few paved roads in this section of Pennsylvania, but the common dirt roads are good during the summer and fall, which probably accounts for the unusually flourishing condition of the Williamsport Automobile Club. This organization is headed by W. C. Riley, president, the other officers being Charles D. Wolf, treasurer, and F. G. Sweet, secretary, and it now has 80 progressive autoists on its membership roll. The club does a great deal to foster interest in automobiling and is deservedly prosperous, its annual hill-climb and race meets being events of importance in this part of the State. Its membership is rapidly on the increase, and it is making its influence felt for the betterment of the roads and autoing conditions generally.

INDIANAPOLIS INSISTS ON REGISTRATION.

INDIANAPOLIS, IND., July 27.—The Indianapolis authorities have made good their threat to arrest automobile owners who failed to take out the city license last year. More than twenty arrests have been made during the past week, and it is said they will be continued until about 250 persons have been arrested. Local owners are indignant, but there seems to be nothing they can do, as the police court is assessing fines of $1 and costs, amounting to $11 in each instance where a 1907 license fee was not paid. No exceptions are being made, even if a 1908 fee has been paid, and a legal test of the law will immediately be made.

Last year, at license paying time, a test case was going through the courts to test the validity of the Indianapolis license ordinance. It was argued that it conflicted with the State registration law, but the courts held differently. The arrests last week were of business and professional men, principally in the downtown district. Other owners are to be arrested this week, but so far no one has suggested testing the attempt to collect a back license fee.

BAN PUT ON OFFENSIVE EXHAUSTS.

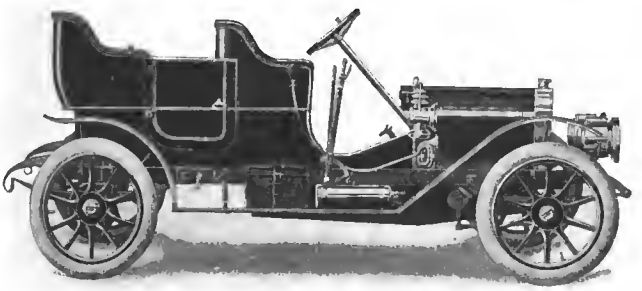
After August 1 New York drivers must keep a sharp eye on their exhausts, at least while on the driveways under the control of the Park Commissioners. Otherwise they may receive some unpleasant attentions from the park police. At a meeting of the Board last Friday the following ordinance was adopted:

"No person shall be permitted to run a motor vehicle in the parks or parkways of this city, under the jurisdiction of the Department of Parks, which emits from the exhaust or muffler thereof offensive quantities of smoke or gas or disagreeable odors," which means that the smoke and smell must go.

The worst offenders are said to have been the various taxicab companies. As the cabs are mostly handled by inexperienced drivers, some of the companies have standing orders that the exhausts must always be kept smoking, in order that the engines may be sure of ample lubrication. This practice will now have to be stopped. Similar ordinances against offensive exhausts have long been in force in Paris, as well as many other cities, and have had a salutary effect.

COMPLETE LINE OF KISSELKAR MODELS FOR 1909

FOR the coming season the Kisselkar will be represented by distinctive models, two of them designed for the buyers of light and handy cars, and a third, which is an entirely new addition to the Kisselkar line, consisting of a six-cylinder 60-horsepower touring model. Although the Kisselkar at $2,000 created no little sensation when it first made its appearance, the newcomers are considerably more in the way of eye-openers, as they are built on precisely the same lines as this year's $2,000 car, but are listed at $1,350 in the roadster type and $1,500 as a touring car. The Kisselkar has shown what it is made of by its excellent performances in competition with cars costing considerably more, so that there is little doubt that the announcement of a car of this quality at such a substantial reduction in price will give rise to an immediate and strong popular demand for this Western product. The new models will be smaller than



Attractive Ensemble of the New $1,500 Kisselkar.

the original Kisselkar, but in every other particular will be identical with their higher-priced prototype except for the proportionate reduction in horsepower.

Specifications Compare Well with High-priced Cars.

In view of the low prices at which the new Kisselkars of the light type are listed, the manner in which their specifications tally with those of cars selling at much higher figures makes them of unusual interest to the large number of buyers who have long been on the lookout for something of this kind. The motor is of the four-cylinder vertical type, the cylinders being cast in pairs, while their dimensions are 4 1-4 inches "square," that is, the bore and stroke are the same. The motor is rated at 25 to 30 horsepower and is designed to run at a moderate normal speed, thus making for a durable engine and one that is free from vibration. Either a Schebler or a Stromberg carbureter will be supplied, while a positively driven, force-feed mechanical oiler will take care of the lubrication, ignition being by means of the usual standard high-tension system, employing a set of accumulators and dry cells as the source of current. For transmitting the power, a cone clutch will be used in connection with a three-speed sliding gear-set on the selective plan, driving by propeller shaft to a floating type of rear axle. The differential is of the spur gear type and large driving bevels are used.

As evidence of the fact that details have not been slighted simply to bring the selling price down the rear axle is equipped with two Timken roller bearings on the pinion shaft, instead of one, thus insuring perfect alignment, while Spicer universal joints with dust-proof grease cups are employed on both the driving and propeller shafts. All control levers are drop-forgings, properly machined, keyed and bolted, instead of being taper pinned as is usual in low-priced construction. The axle ends from the center housing are keyed to tubing and then put under hydraulic pressure. In fact, everything is fastened in the most approved manner, only keys and bolts being employed, there being none of the usual taper pin fastenings such as were so commonly employed on cars of earlier vintages, and which were responsible for a very large part of the profanity that petty mechanical troubles gave rise to on many of the old timers.

Regular Models Will Also Be Continued.

The announcement of these new models is not to be regarded as being equivalent to the throwing over of the regular model of the Kisselkar which has shown up so well during the past season, as this is to be continued with scarcely any change. The general lines will be identically the same in numerous respects, but the car will represent a great deal more for the money than it has, and in view of the original figure this is saying a great deal. The body has been made six inches longer, while 36-inch wheels will be used instead of 34-inch, and in view of the initial expense for wheels and tires that the manufacturer has to bear in making a change of this nature, it may easily be put down as an improvement of considerable importance on any car selling at $2,000. An I-beam, drop-forged axle will be substituted for the lighter axle formerly employed, and the Atwater-Kent spark generator will be made a feature of the standard equipment where the ignition system is concerned, this taking the place of the four-unit dash coil employed on the previous Kisselkars. For the coming season these cars will continue to list at $2,000 with regular equipment, or $2,200 with special equipment, consisting of a Pantasote-lined top with bow separators, slip covers, Solar lamps, generator, gas tank and robe rail, it having become quite customary in the past few years for makers to list their cars with special equipment of this kind, in order that the purchaser may know exactly what the machine will cost him in complete running order, which means with those numerous accessories that make for comfort, included in the price. It seems quite probable that in time this will be a development that will take strong hold on the automobile trade, so that a top will come to be considered as much a part of a car that ought to be included in its selling price as it is in the case of a buggy.

New Six-cylinder Kisselkar for 1909.

In bringing out a heavy machine for next season's business the designers of the Kisselkar have not departed in any way from their regular standards, the new six-cylinder 60-horsepower representative of the line being merely an enlargement characterized by all those features of construction which have become familiar on its smaller predecessor. The cylinder dimensions are 4 3-4-inch bore by the same stroke, while the accessories are all the same as on the smaller engine. Provision is made for a high-tension magneto and this will be supplied as an extra. As a regular equipment, the Atwater-Kent spark generator will be fitted. This car is built with a drop-forged I-beam forward axle, is hung on three-quarter elliptic springs and has a 128-inch wheelbase. The wheels are 36-inch and the tires are 4-inch front and 4 1-2-inch rear. With a five-passenger tonneau and regular equipment this car lists at $2,750 in complete running order. As a seven-passenger car the price is $3,000, this including a Bosch high-tension magneto as a regular part of the equipment.

In thus adding new models at each end of the price line, so to speak, the builders of the Kisselkar, the Kissel Motor Car Company, of Hartford, Wis., have placed themselves in a position to take advantage of both extremes in the demand that bid fair to make themselves felt during the coming year than ever before in the history of the automobile industry in this country.

NEWS FROM TIRETOWN, OHIO, TELLS OF MUCH ACTIVITY

AKRON, O., July 25.—The Palmer-Hawkins Rubber Tire Company, of Akron, was incorporated a few days ago under the laws of Ohio, for the purpose of exploiting and marketing the sectional solid tire for heavy trucks patented by H. A. Palmer. It has not been decided by the company whether it will manufacture the tire itself, license other companies to make it, or contract for its manufacture and place it on the market. The company starts off with a nominal capitalization. Mr. Palmer believes that his tire has features in the sectional construction that are superior to all others.

The largest picnic out of Akron this year was run Saturday by the Diamond Rubber Company, when over 5,000 persons went to Meyers Lake, at Canton, on five trains. The Diamond band led the marchers to the depot in the morning. Charles Stamm was at the head of the publicity department for the excursion.

Akron is having her first chamber of commerce on a large scale, the movement having just been organized. Local rubber manufacturers are taking considerable interest in the organization for the advancement of the city, O. C. Barber, the match king and a stockholder in the Diamond Match Company, being present. The rubber manufacturers on the board of directors are H. B. Raymond, of the Goodrich Company, and A. H. Noah, treasurer of the Diamond Rubber Company.

Akron figured very largely in the Glidden tour, that closed this week, in more than one way. In addition to A. Auble driving one of the perfect score cars, Oldsmobile, in the Chicago Motor Club team, Akron tires were conspicuous, and a friendly rivalry existed between the manufacturers. The Goodrich and Diamond companies have both issued statements covering the participation of their makes of tires in what was really a great endurance contest. The Goodrich company makes this claim:

"Twenty-three of the 44 Glidden and Hower contestants were equipped with Goodrich tires. Of the 17 clean score cars, 9 were equipped with Goodrich tires, and of the 5 clean score cars in the Hower contest all had the Goodrich make. All of the winning Pierce Great Arrow team's cars had the same make."

The Diamond company makes its claim on superiority in cost of equipment in the following statement:

"Making actual tire cost the basis, as usual, the winning of the Glidden tour, so far as tire equipment is concerned, is credited to the Diamond make. The reports compiled by observers and given out by the Diamond Rubber Company show an average tire cost per car of $46.91 for all cars in the tour, both contestants and non-contestants. The average cost for Diamond tires alone was $16.88, considerably better than the average for the whole tour. The average cost per car for tires excluding Diamond equipment was $64.94. The basis of cost is taken with size 34 x 4, representing the general average of tire sizes used. All items, even punctures, etc., capable of ready repair, are taken into the account, but the big feature of the tire cost was the blowing out of casings and tubes. Of sixty-one blown-out tires all told, the number of Diamond tires so damaged was but five, and this with twenty-one contesting and non-contesting cars using the Diamond make. Of the twenty-two contesting cars with perfect scores at the end of the tour, nine were equipped with Diamond tires; two cars changed to Diamond en-route.

Announcement is made that the Firestone Tire & Rubber Company is preparing to enlarge its present capacity by at least one-third. Part of the improvement is already under way. A part of the present plant will also be rebuilt. The B. F. Goodrich and Diamond Rubber Companies are also preparing to make extensive additions.

HENRY FORD'S LITTLE RUNABOUT JOKE.

DETROIT, July 26.—Deep gloom has for some time enshrouded a considerable number of Detroit's colony of space eliminators whose high-priced and high-powered machines have been compelled to take dust from a diminutive car that heretofore was never regarded as a competitor in the matter of speed. Harsh things have been said regarding the various cars by their respective owners, and maledictions heaped upon the head of the man who in every instance succeeded in cleaning up by a margin that left no room for doubt. Incidentally it has been disclosed that the man who said Henry Ford was devoid of a sense of humor little knew who he was talking about.

Drivers of touring cars have for some time been mystified and chagrined by the ease with which Henry Ford, driving a little runabout about the city or country, succeeded in leaving them behind, despite their best efforts. Much speculation was indulged in, and great grew the fame of the little buzzabout capable of making all others look as though running backward.

Now the secret has been disclosed to a few, although it will be news to the vanquished. Some time ago Mr. Ford had constructed a six-cylinder engine which he mounted on a stock runabout chassis, to all outward appearances identical with the other runabouts turned out by the Ford Motor Company. Trials showed it to be possessed of practically unlimited speed and power. Then Henry Ford's humor asserted itself. Whenever a competitor was met on the road he would be passed as though standing still. Men prominent in the financial world and actively identified with automobile plants here have fallen victims to the speedy little runabout without being able to explain the trouble.

The secret was too good to keep, however, and the story leaked. Now that it is out numerous motorists will be inclined to retract some of the unkind things said about their machines and join Mr. Ford in the laugh at their expense.

RAPID MAKES BIG ADDITION TO PLANT.

PONTIAC, MICH., July 27.—Some idea of the growth of the demand for the Rapid commercial vehicles may be gained from the fact that the makers, the Rapid Motor Vehicle Company, are now at work on the fifth addition to their plant in three years. A contract for the erection of a new building to measure 60 by 300 feet, and two stories in height, has been let and the work of excavation already commenced. It will be constructed entirely of concrete and steel according to the Kahn system, even the roof and stairways being of this material, so that the building will be absolutely fireproof. The supporting walls will be five inches thick, but most of the outer walls of the building will be of glass. The present main building of the plant measures 60 by 300 feet, with an L, 60 by 200 feet, so that the new structure will practically double the capacity of the works. Other buildings comprising the plant are the body shop, 50 by 120 feet, the power plant, testing house and oil house. At present 200 men are employed and 10 cars are being turned out a week. Rapid cars are finding their way into every country of the world, no less than 10 per cent. of the entire output having been exported.

NEW PARTS CONCERN IN CONNECTICUT.

HARTFORD, CONN., July 25.—The Bristol Engineering Company is the title of a new company that has just been incorporated to manufacture automobile parts, and later to build taxicabs. The plant will be located in Bristol, which is a suburb of Hartford. The organizers are the Hon. Albert P. Rockwell, president of the New Departure Company, De Witt Page, secretary of the same concern, and F. E. Moskovics, of Kingston, N. Y. Mr. Rockwell is president of the new company, Mr. Page, vice-president, and Mr. Moskovics, secretary and treasurer. The capitalization has not been decided upon.

Installing Giant Gasoline Tank at Maxwell Factory.

The new gasoline storage tank shown in the photograph has a capacity of 10,000 gallons and was recently placed in the grounds of the Tarrytown, N. Y., factory of the Maxwell-Briscoe Motor Company. The picture shows the tank being hauled from the railroad station to the factory by a 24-30-horsepower Maxwell, which, with the aid of a block and tackle, moved the big cylinder at the rate of four miles per hour.

POPE COMPANY MAY BE REORGANIZED.

HARTFORD, CONN., July 25.—After hearing the arguments of both sides, Judge H. J. Curtis, sitting in the Superior Court here, signed an order authorizing the receivers of the Pope Manufacturing Company to transfer $300,000 of the concern's assets to New Jersey, for the purpose of paying another dividend of 25 per cent. to the creditors, as recently ordered by Vice-chancellor Howell, of Newark. The form drawn up by the receivers did not meet with the approval of the counsel to the Creditors' Protective committee, on the ground that it did not conform to the petition. In order to pay the dividend in question, $380,000 was necessary, and the order read "to transfer such sums as may be necessary from the sum of $628,000, now in the hands of the Connecticut receivers. Percy S. Bryant, of counsel to the creditors, quoted numerous figures, stating that the company had $1,338,000 in various jurisdictions, beside $39,000 outstanding in drafts and $136,000 as the proceeds from the sale of the Columbia steel plant, and stated that the creditors wanted an order to pay a 25-per cent. dividend in cash.

Another bone of contention was the question of setting aside $65,000 as a 25-per cent. dividend on the Unzicker claim, should this be allowed, but an order was entered striking this claim from the records in Connecticut. The attorneys for the different interests finally decided on the form of the order authorizing the receivers to transfer the necessary assets for the general 25-per cent. dividend and it was signed by the court. Judge Curtis also granted the order of the receivers, authorizing the receivers to carry on the business for another period of four months, and the latter made it plain that a reorganization would undoubtedly take place before the expiration of the time allotted.

HARTFORD DEALERS HAVE A GOOD IDEA.

HARTFORD, CONN., July 27.—Rather unique is the scheme of the Hartford Automobile Dealers' Association. During the week of the State fair at historic Charter Oak Park, the association will conduct a mammoth tent show of automobiles, accessories, and the like. The floor space will be about 15,000 feet and will be covered with tan bark. Now, then, inasmuch as a State fair is always a drawing card, it is reasonable to assume that those who are out to see all there is will visit the automobile exhibition. Many of the dealers in the association will have their 1909 models to show, and the exhibition will be a comprehensive one; at least the show committee will endeavor to make it such. The farmers are coming more and more to realize the true worth of the motor car, and the proposed show held in connection with the fair should prove a useful object lesson. Needless to say business will be done, for crops promise to be good and confidence being well restored orders are in prospect.

Next October there will occur the formal opening of the two million dollar Connecticut river stone bridge at Hartford. It is proposed to make the motor car one of the chief features of the celebration. Agitation favors the holding of the local club hill-climb during the celebration, which will probably last a couple of days. The new structure is the gateway of the east and is one of the finest pieces of stone masonry in the world.

NEWS FROM THE FRANKLIN HOME.

SYRACUSE, N. Y., July 27.—At the Country Club last Wednesday evening, H. H. Franklin, president of the H. H. Franklin Manufacturing Company, entertained the company's branch managers and traveling salesmen. They are in Syracuse from their various territories to attend the annual conference, which lasts a week. A most enjoyable evening was spent, and the host was toasted in true "drummer" style. Those present were H. H. Franklin, F. R. Bump, W. S. Jewell, A. B. Henley, J. F. McLean, J. E. Doane, L. E. Hoffman, George Ostendorf, George Messer, W. J. Reynolds, F. H. Sanders, R. La Porte and A. B. Caldwell.

Friday the managers and salesmen were the guests of the Crucible Steel Company and a tour of inspection was made through the big plant. The Franklin company uses large quantities of the high-grade steel made by this concern.

The H. H. Franklin Manufacturing Company has announced that the usual annual picnic for employees will be held at Long Branch, near this city, on August 15. The program will include numerous athletic events, and a baseball game will be one of the features. This company's shops, by the way, muster one of the strongest amateur nines in central New York. For three or four years it has been maintained, meeting the strongest shop nines of this section, and last year it won the championship trophy of the City Amateur League.

PFANSTIEHL LABORATORY HAS NEW PLANT.

CHICAGO, July 27.—The Pfanstiehl Electrical Laboratory is now occupying its new building in North Chicago. The new factory is a four-story brick structure with side track accommodations, and is supplemented by a specially constructed testing and experimental laboratory where the concern will continue its policy of advancement in gas engine ignition. Every necessary detail for the manufacture of x-ray and spark coils has been provided, and customers will be given the advantage of the special experimenting and research which these added features will facilitate. The change of location was made necessary by the increase in demand for the Pfanstiehl coil, which started several months ago, and which, the makers state, shows no sign of abating, but, on the contrary, is steadily increasing.

Laboratory at North Chicago Where Pfanstiehl Coils Are Made.

AUTO NEWS MADE IN GERMANY.

BERLIN, July 23.—The joint military drive of the German and Austrian Motor Volunteer Corps on July 27, 28 and 29 has attracted 44 entries, 25 of which are German. The start takes place at Vienna with the finish at Berlin. Cups have been given by the German Emperor, the Austrian Emperor, Prince Henry and the Archduke Frederick, as the character of the tour is a strictly military one, and is intended to show the car in war.

Lautenschlager, who has just gained such a splendid victory in the Grand Prix, made his début in first-class racing in this event. For years past he has been entrusted with the testing of the Mercedes cars and had also accompanied Salzer as his mechanician in many a big tussle, but this is the first time he personally has been seen at the wheel of a big racer.

A qualification test of 1,570 kilometers for the German Government subsidy for motor wagons and vans is being carried out by the Pioneer troops, a number of big German firms taking part in the contest, the result of which will be the basis of the subsidy scheme. A Buessing cart rigged up as a repair shop accompanies the tour, and will make all necessary repairs.

It is rumored that the Mercedes Company has sent in a protest against Erle's victory on a Benz in the Prince Henry tour, stating that the list of winners needs a careful examination.

September 20 has been fixed for the annual Semmering hill-climb of the Austrian Automobile Club, which at its inception was won three times running by the late American enthusiast, Mr. Dinsmore's Mercedes, driven by Werner, now head chauffeur to the German Emperor. In the racing division sub-classes have been arranged for non-restricted cars and cars of the 1908 Grand Prix type, while one category of the touring vehicles is open to Prince Henry type machines.

MASSACHUSETTS BODY TAKES UP "TRAPPING."

WORCESTER, MASS., July 27.—John P. Coghlin, chairman of the "Trap Committee" of the Massachusetts State Automobile Association, and president of the Worcester Automobile Club, issues the following bulletin:

The directors of the Massachusetts State Automobile Association have decided to take up the question of traps in Massachusetts. The directore feel that the traps fail to accomplish the purpose of eliminating reckleee driving. The directors are satiefied that a very large per cent. of its members drive carefully and in order to prevent careful drivers of automobilee from being annoyed by trape, a great many of which are operated for a pecuniary consideration, we have arranged with a clipping bureau to furnish us information as to location of traps.

We wieh you to co-operate with us and furnish us any information you may have with reference to traps. We ehall furnish a list of these to all clubs and instruct them to post them in their club rooms and in addition to this will furnieh each member of the Massachueetts State Automobile Association from time to time a list and location of trape in Massachusetts together with any comments which we deem neceesary.

Kindly co-operate with us in this matter, and address any information you have to John P. Coghlin, chairman trap committee, Massachusette Automobile Association, 234 Main street, Worcester.

A NEW TRANSCONTINENTAL RECORD.

Two college students, C. T. Crocker and M. C. Scott, with their chauffeur, Charles West, decided to go home to San Mateo, Cal., for their vacation in an automobile, instead of by train, as usual. So Crocker equipped his 1907 40-horsepower Fiat runabout, which had already seen some strenuous service, with an extra large tank, loaded up with ropes and tackle, provisions, guns and ammunition, and a camping outfit, and on June 25 the party left New York. Five days later they were in Chicago, and on July 3 they reached Cheyenne. There, however, they were detained two days while a local wheelwright was making a new wheel to replace one broken on the road. They finally arrived in San Mateo, July 14, having been twenty days on the trip, and establishing a new record for cars with a single crew, although the jaunt was undertaken principally for pleasure and not record-making.

AUTOS AT QUEBEC'S TERCENTENARY.

QUEBEC, July 27.—Automobiles played an important part in Quebec's recent tercentenary celebration, and it is estimated that over 200 came to this city from different parts of the Dominion and the United States. As the street car accommodations to the Plains of Abraham, where the principal exercises were held, were rather inadequate, everybody who could obtain a car was only too glad to make use of it. The roads were in good condition and made the run very pleasant. The Comet Motor Company, one of Canada's few automobile manufacturers, supplied five of its cars to the Prince of Wales and his suite for the occasion. An amusing interview is reported with A. A. Brager, of Baltimore, Md. "Your streets are worse," said Mr. Brager, "and your sewage system is very nearly as bad as in my own city, which is saying a great deal."

Reports from Charlottetown, P. E. I., state that an important step was taken in the fight against the new automobile bill when the counsel for the automobile interests moved for a rule to set aside the conviction made recently by Magistrate McDonald whereby the defendant, who illegally drove an automobile to test the act, was fined $500. The grounds on which certiorari were asked for were that a bill of this kind comes under the head of criminal law, which only the Parliament of the Dominion can enact, and that it is therefore beyond the power of the Provincial Legislature. A rule absolute was granted, and the argument was set down for hearing at the November term.

NO ARDENNES RACE FOR THIS YEAR.

PARIS, July 23.—Owing to the Ardennes race and the Florio Cup contest, both of which were announced under Grand Prix rules, being scheduled for closely approaching dates, it has been decided to abandon the former event this year in order to assure the success of the latter. The classic Ardennes race was originally announced for August 12; constructors thinking the interval between the Grand Prix and the Belgian race too short, a postponement was made to August 27. This, however, clashed with the Florio Cup contest announced months ago to be run on September 24, and a protest was made by the Italians. After a conference between the two parties, it has been decided to alternate the two races, the Italians holding a speed contest for the Florio Cup next September, and the Belgians running their Ardennes race in 1909. The following year it will again be the turn of Italy, and so on each year. By this arrangement there will be but two important speed tests in Europe each year under international rules, the Grand Prix and the Ardennes or Florio.

Owing to the unexpected result of the Dieppe race more importance than usual attaches to the Italian speed test this year. Though all who were present at Dieppe will not come to the starting line at Bologne, the number will certainly be greater than if the French cars had lived up to expectations on July 7.

A REPAIR SHOP IN THE WHITE MOUNTAINS.

BRETTON WOODS, N. H., July 28.—The White Mountains are growing in popularity each year as a touring district. Hundreds of cars speed over the roads daily. Most of the tourists make Bretton Woods their destination or use it as a central point for day runs through the outlying district. It was not enough to provide them with a commodious garage, which has been in existence for several years, so the management of the Mount Washington and Mount Pleasant hotels, John Anderson and J. D. Price, respectively, who are also well known hosts at Ormond during the Florida beach meets, this season have added to the plant a repair shop with complete machine tool facilities.

The shop is in two sections. In one there are facilities for owners and chauffeurs to do their own repairing free of charge. The other is a completely equipped shop. In the former work benches, vises, tackles and a pit are available. The latter is filled with standard up-to-date machines, and has competent mechanics always on hand. A charging outfit is also installed.

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

From Rome, N. Y., comes the reoort that the Long-Turney Manufacturing Company, makers of the Long radiators, is about to erect a two-story addition, 50 by 100 feet, to its factory.

John Barker & Company, Ltd., Kensington, W., London, England, announce that their motor department is open to negotiate with American manufacturers of motor novelties and accessories on the basis of exclusive representation in the British Isles.

A new automobile factory is to be located at Moline, Ill. It is the Velie Motor Vehicle Company, and will manufacture gasoline, electric and steam cars. All the promoters are connected with the Velie Carriage Company. They are W. L. Velie, O. E. Mansur and S. Harper.

The 1909 $2,500 contest for Winton "Six" chauffeurs will probably be open to drivers of the 1908 "Six" as well as of the 1909 "Six." In this case no mileage reports will be accepted before October or November, in order that cars now in service may not have too great an advantage in time over new cars.

The Grove Garage Company, with W. B. Grove as vice-president and manager, has just opened for business in Bluffton, Ind. They will do an agency as well as a garage business and are desirous of receiving catalogues of cars, accessories and supplies, with a view to negotiating for their active representation in that part of Indiana.

Seattle, Wash., business men have formed a company to operate taxicabs in that city. S. A. Burch is president; Frank Hanford, vice-president; Charles Perry, secretary, and C. M. Hatcher and C. A. Stewart, managers of the concern, which has a capital stock of $150,000. Five cabs are to be in use within thirty days, and others have been ordered.

Another city to enjoy the advantages of the most modern method of transportation is Los Angeles, Cal., whose local taxicab company placed its first machine in operation recently. E. A. Anthony, manager of the Western Motor Car Company, is interested in the new enterprise, and headquarters for the present are in his garage. The cars in use are of the Thomas make.

Tennant Motor, Ltd., Chicago agents for the Peerless, at 1449 Michigan avenue, have just increased their capital stock from $7,500 to $60,000, according to certificates recently filed with the State Secretary of Illinois to that effect. This agency has had a wonderfully successful season with the 1908 cars and has already sold no less than 16 Peerless cars with Kimball limousine bodies for 1909 delivery.

The adaptability of the automobile to all continents is strikingly shown by the trip of an officer of the German army, Lieutenant Gratz, through German East Africa. The roads of this country are of the most primitive character, and great difficulties are met with, of whlch the tropical heat is not the least. Lieutenant Gratz reports that his Continental tires are giving the best of satisfaction, even under these adverse conditions.

Another startling reminder of the grade crossing menace was the experience of three prominent motorists on the Mills crossing in the town of Canton, Conn. The car was approaching the crossing and the oncoming passenger express was not noted. The driver of the car brought it to a quick stop, and as the train whizzed by it clipped the two headlights off as clean as a whistle, the fate of the party having been decided by possibly an inch.

That there is a demand for foreign automobile tires in this country seems to be the opinion of Pirelli & Company, Milan, Italy, who have recently established an American agency at 296 Broadway, New York. Sherburne P. Becker, formerly Mayor of Milwaukee, is one of their latest customers. It will be remembered that this was the tire used on the Itala car with which Prince Borghese won the Pekin-Paris race.

The Grout Automobile Company of Orange, Mass., states that G. H. Denton of Denver, Col., recently drove one of its cars 272 miles over the mountainous Colorado roads in one day, his running time being 13 hours. Sixteen gallons of gasoline were consumed. The car was a 1905 model, which had already been run about 20,000 miles, and carried four passengers. No repairs or adjustments of any kind were made.

Berlin, N. Y., is famous for its gladiolus, or rather the extensive fields of them that constitute a feature of "Meadowvale Farm," as it would be out of place to use the word in the singular in view of the fact that during the season, which extends from August 1 to September 10, there are from 15 to 30 acres of them to be seen in bloom at one time. Many automobile parties drive to Berlin from the Berkshire region just to get a glimpse of the great expanse of color.

The New York branch of The White Company will hereafter be known as the Eastern branch, and George W. Bennett will take the title of Eastern sales manager. The territory to be handled by the Eastern branch comprises New York State as far as Rochester, the eastern counties of Connecticut, part of Berkshire county, Mass., the entire States of New Jersey and Delaware, and the eastern half of Pennsylvania. The office of the White Company in Philadelphia becomes a sub-branch under the control of Mr. Bennett.

A decision against the complainant has just been handed down by the United States Court of Appeals in the case of the Boston Woven Hose and Rubber Company versus the Pennsylvania Rubber Company, referring to a patent claimed to cover the use of security bolts on automobile tires. Had their patent been upheld, the Boston company would have been able to collect royalties from anyone making or using such security bolts. This would have affected the whole tire industry.

According to C. W. Kelsey, the 24-h.p. Maxwell will undertake the New York-San Francisco endurance run even if none of the Glidden tourists accept the challenge. Mr. Kelsey has just returned to the factory from Chicago, where he went to make preparations for the contest. The route contemplated is as follows: New York, Buffalo, Erie, Cleveland, Toledo, South Bend, Chicago, Cedar Rapids (Ia.), Omaha, Cheyenne (Wyo.), Ogden (Utah), Elko (Nev.), Sacramento, San Francisco. The distance in round numbers is 4,200 miles.

On the evening of June 21, 1885, seven owners of Rambler bicycles met in the city of Buffalo, N. Y., to organize the Buffalo Rambler Bicycle Club. Just a few weeks ago these seven original members, with some two hundred fellow members, celebrated their twenty-third anniversary at a reunion and outing at Eagle Park, in that city. Although the club started in an unpretentious way, it was soon the largest in Buffalo, maintaining a large gymnasium with billiard and reading rooms, and many world-famous drivers carried its colors to victory. It is now the oldest bicycle club in the world. Of its two hundred odd members not a few own Rambler automobiles.

The Goodyear Tire and Rubber Company has taken a contract to furnish 25 of the New York Transportation Company's 50 taxicabs with its quick detachable tires. The remaining 25 were originally so equipped, and had given such good service that the company decided to use Goodyear tires on all its cabs. Goodyear tires will also be used on the 300 cabs of the New York Taxicab Company and the 50 cabs of the Terminal Taxicab Company of Washington. The Goodyear Company points out that the tubes and casings of these tires can be changed very quickly, and by the use of the new Goodyear air bottle, charged with pure air, can be inflated in less than a minute.

When Presidential candidate Taft visited President Roosevelt at Oyster Bay, July 23, he was met at the West Twenty-third street ferry in New York by one of the government White steamers, and under the protection of "Casey the Cop," was driven in a jiffy to the East Thirty-fourth street ferry, the traffic and speed regulations being for the moment suspended. Once in Long Island, the car proceeded in record-breaking style to the President's residence at Sagamore Hill, and a few hours later brought Mr. Taft back all the way to his hotel in New York. It will be remembered that on his last visit to Oyster Bay, three weeks ago, he came back as far as Long Island City in the automobile, and evidently the habit is growing upon him.

A unique test will be started by the Brush Runabout Company this week, when four Model B 7-horsepower Brush runabouts and one Brush delivery wagon will leave Detroit on tours radiating through all parts of the country. One will go through Cleveland, Buffalo and New York to Boston; others to Pittsburg, Philadelphia and Washington, to Cincinnati, St. Louis and Kansas City, to Indianapolis, Springfield, Ill., and Chicago, and to Chicago, Madison, Wis., and Minneapolis. The tours are designed to demonstrate the fuel economy, reliability and general efficiency of the cars through the country which they traverse—incidentally spreading the good roads gospel. A booklet will be published by the company at the end of the run, giving information about gasoline and oil consumption, repairs and adjustments, etc.

NEW AGENCIES ESTABLISHED.

W. C. Chambers and F. C. Winkel have opened a new auto supply station in Philadelphia, at 1320 Vine street. The new concern will be known as the Automobile Supply Company.

The Michelin Tire Company has opened a branch at 2001 Euclid avenue, Cleveland, O., under the management of R. B. Tracy.

with D. K. Dickinson, formerly of the Hartford Rubber Works, as assistant.

The Gyroscope Automobile Company bas just been incorporated to handle tbe output of Blomstrom Gyroscope cars. The incorporators are C. P. Fleming, Douglas Hamilton and A. L. Kull, the latter heing general manager. The company will shortly establish its salesrooms at 231 West Fifty-fourth street, New York City, where extensive alterations are now in progress. The new headquarters will have ample storage room and a large macbine shop.

PERSONAL TRADE MENTION.

C. A. Coey, for many ycars the Thomas Flyer representative in Chicago, has at last severed his connection with that firm, and will shortly locate on Automobile Row as agent for the De Luxe.

Followers of automobile trade doings will remember the work of Percy F. Megargel in the Oldsmobile New York-Portland race, and the double transcontinental trip of the Reo *Mountaineer*. He is now advertising manager for the National Sales Corporation, with offices at 296 Broadway, New York.

Charles M. Brown.

Recently appointed manager of the New York branch of the Winton Motor Carriage Company.

"Eddie" Richards, the well-known driver of Buffalo, has just left the E. R. Thomas Motor Company to accept the position of demonstrator for Mason B. Hatch, the Chalmers-Detroit agent in Buffalo. Mr. Richards drove perfect-score cars in the Glidden tours of 1906 and 1907 and bas the reputation of heing one of the best demonstrating salesmen in the business.

C. H. Tucker, the sales manager of the Acme Motor Car Company, has gone to Savannah, Ga., where he will remain two weeks. Mr. Tucker stated that his trip was necessitated by an accident to J. C. Finney, tbe Savannah agent, who was thrown from his car while speeding and is still confined to his hed. A number of cars bad been shipped to Savannah and Mr. Tucker went to look after them.

Mason B. Hatch, salesmanager of the E. R. Thomas Motor Company, of Buffalo, N. Y., has resigned to go into the retail field. He will handle the Chalmers-Detroit line exclusively in Buffalo and surrounding territory. Mr. Hatcb is the second salesmanager to join the ranks of the Chalmers-Detroit dealers. The unusual opportunity offered hy tbe Chamers-Detroit line is the explanation given by Mr. Hatch.

In the Columhus (O.) *Press-Post* the following recently appeared: "If persistence could he humanized and made tangihle, it could be presented in no clearer vision and suhstance than emhodied in the physical and mental make-up of C. D. Firestone, of the Firestone Tire and Ruhher Company, Akron, O., who of all men typifies the word in the fullest and highest sense. Every fiher in his being, mental and physical, means fight, determination, persistence. That has heen C. D. Firestone all his career. He nevur waits to see what position some other person is going to take. He takes his position first and then turns ahout to see who has joined him. If none, then he is yet sure he is right. Whatever his views and sentiments, he believes in them to the full and fights for them. Mr. Firestone is a man of enlarged business capacity, with physical grasp equal to his intellectual grasp."

TRADE PUBLICATIONS RECEIVED

Continental Caoutchouc Company.—This company is sending out to automobile users an interesting booklet describing the trip of J. M. Murdock from Los Angelee to the Atlantic Coast. Mr. Murdock, of course, ueed Continental tires. The circular aiso contains data of the carrying capacity of tires, hints for proionging their life, etc.

Thomes B. Jeffery, & Co., Kenosha, Wis.—One of the oidest and brigbtest of tbs many "house magazines" is that published in the intsrests of the Rambler. The current issue is entitled the "Maintenance Number," and is devoted largely to letters from Rambler owners detailing their expenses and mileage. In ons articie testimonials from owners in thirty-seven States have been gathered, some of whom have had their care four or five years. Many of them have truly remarkabie records. The magazine, as usual, is iiiustrated with many photograpbe of Rambler cars of different types, and contains a numbsr of quotations from well-known writers.

Bosch Magnsto Company, 160 Wsst Fifty-sixth street, Nsw York.—New publications concerning the products of this company have to do with the recently announced Bosch magnetic plug ignition with low-tension magneto (system Honoid), for three, four and six-cylinder motors. Full details of the new type of plug, wbich makes possible the mechanical simplicity of the high-tension with tbe freedom from electrical troubies and wiring of the iow-tension system, are given as well as iiiustratione of its parts and assembly. Aiso tbe synchronized low-tension magneto designed to act as the source of current suppiy and the method of wiring are shown together with other necessary information concerning the new system.

Cadiiiac Motor Car Company, Detroit, Mich.—"How to Drive a Model G Cadiiiac" is one of the beet-written instruction books that have come to hand in a long while. It certainly contains a great deal of information that the average owner of a car is desiroue of having and convincee the man who thinks that "ae long as the car runs everything is aii right," of the extent of his error. There are many pointers given which, if heeded by those who read them, will save many a doiiar that must otberwise bé paid out for experience. In fact, the contents of the booklet are much more comprehensive than the title would indicate, as there is a great deal of value concerning the maintenance of the car as well.

Hyatt Roiier Bearing Compsny, Newark, N. J.—"Technical Data and Dimsneions of the Hyatt Flexibie Roiier Bearing as Applied to the Motor Car" outiines the raison d'être of a well-executed booklet prepared by this firm to ehow the application of its product to the automobiie in such situations as the change-speed gear-set, shaft drive, rear axie bearings, bevel gear drive, countershaft on a chain-driven car and similar rôies. Nó iess than 250 sizes of Hyatt roiier bearings have been standardized for all conditions of speed and load and detailed information concsrning these, as well as their capacity and fitness for various applications on the automobiie, is given. It ie entitled Bulietin 31, and will be sent upon request.

Page-Storms Drop Forgs Company.—A folder from the Pags-Storms Drop Forge Company announces their removal from Springfield and Chicopee Falls to their new plant at Chicopee, Mass. By combining the two shops the managsment is now in a position to give ths details of the business a close personal supervision, which should result most satisfactoriiy and insure a first-class product. The company will continus to manufacture the same lines as before, including drop forgings, drop-forged wrenches, eyebolts, thumbecrews and nuts, etc. Thsir long experiencs has enabied them to adopt the most modern construction and equipment for the new plant, thereby insuring their customers the best of service.

Firestons Tire and Rubber Company, Akron, O.—Ths cover of this company's latest booklet seems to represent the Flatiron building, towering majestically above a crowd of rushing firs-engines, delivery wagons and auto trucks, all of course equipped with Firestone tires. In the foreword the manufacturers state that they have aimed to omit all argument of their own; instead, they simply present photos of the different types of vehicles to which they fit their tires, with testimonials from the respective makers. The number of examples iiiuetrated weii shows the remarkabie growth in this industry; and indeed, ae the Fireetone company say, the booklet is not only an advertisement for their tiree but aiso a practicaiiy compiete directory of the manufacturers of auto-trucks. They are represented there in aii styies and eizes, both eiectric and gasoline, from the light parcel-delivery wagon to ths four or five-ton truck.

Packard Motor Car Company, Dstroit, Mich.—Under the titie of "Packard Motor Cars, 1909," this company is eending out one of the firet catalogues of the nsw season's cars. The Packard is such a well-known product that iiiustration rather than description ie rciied upon to convey to the reader the character of the Packard representative for the coming year. Interspersed among the attractive pictures of the various types of Packard bodies snd equipment are some interesting views of ths plant where the Packarde are made. Then there is a mere mention, beside the iiiustration of course, of two new Packard comers. The Packard truck, which is the result of five years' development and the Packard "Eighteen" eiimousine, a brand new comer, about which tbe makers have kept mum up to the present. Special booklets devoted to thess models will be forwarded upon request. The booklet closee with a description of ths technical features of the Packard "Thirty" and a Packard "Thirty" price-list.

Premisr Motor Mfg. Co., Indienapoiis, Ind.—"Character" is the titie of a booklet dsvoted to the exploits of the Quality Car. After explaining their beiief that the cars which make good in public contests will hs found to give equaiiy good service in the hands of their ueere, the manufacturers give an interesting acconnt of the 1907 Glidden Tour, in whicn the Premier entrant and ths Premier piiot car both distinguished themselves. The story is iiiustrated with many good viewe of the contestante at different parts of the course. There follow a number of paragraphs devoted to the three Reliabiiity Runs of the Chicago Motor Club, in all of which the Premier made good showings, and to some fast runs made by Premier owners in different parts of the country. A eecond and smaiier booklet contains the experiences of the Premier "Pathfinder" in iaying out the course for the 1908 Glidden Tour. For twenty-four consecutive days of mud-plugging and mountain climbing this car ran without a falter and without a single mechanical replacement. Like the first, this is illustrated with intereeting photographs taken along the route, including the Delaware Water Gap, Longfeilow's home, hunting cabins in Maine, and other attractive places.

Stewart & Clark Manufacturing Company, Chicago.—"Satisfaction" ie the heading of a large and attractively printed poster that this firm of speedometer manufacturere is now sending out, and satisfaction ie aiso the ksynote of its contente, ae in addition to the dscription and iiiustration of the parts and workings of the Stewart and American instruments, a second sheet pictures the cars of a number of prominent Chicagoans, giving their names and showing how the speedomstere manufactured by this concern are mounted on them. Across the top of this sheet is the statement that "500 cars equipped with Stewart speedometers pass ths corner of Michigan avenue and Jackson boulevard in less than 8 hours," and ths rest of the circuiar subetantiates it by giving ths names of the owners of the 500 cars, as weii as the make of car. As this is one of the busiest etreet corners of the Windy City, the man stationed there for the job found it difficult to get all of the license numbers, and not a few escaped him. The iiiustrations of the circuiar are made from photographs of cars on which Stewart epeedometers are used, all the pictures being snapped in one day as the cars were found standing at the curb in different parts of the city.

INFORMATION FOR AUTO USERS

G-L Economizer.—This is an air-control device which automatically governs the air in the float chamber of any float-feed carbureter, and its action when attached is dependent and is solely governed by the vacuum created in the suction tube of the engine when it is running, automatically stopping and starting with the engine. There are no valves, springs or other parts to wear, and when once attached, it becomes a permanent fixture. It is connected to the inlet manifold, in which a vacuum is created by the motor, and this causes a decrease in the atmospheric pressure in the float chamber of the carbureter, this partial vacuum in the float chamber fluctuating according to the degree of vacuum in the manifold, thus automatically governing the quantity of gasoline issuing at the jet and thereby insuring a uniform mixture regardless of the load or speed. This result can only be obtained where the gasoline issuing from the nozzle is held at a constant level and it insures an increase in power as well as a great increase in the flexibility of the engine, at the same time eliminating difficulties arising from carbon deposits. Maximum power is also obtained and the makers claim a 50 per cent. saving in the consumption, due to the uniformity of the fuel charges. The instrument is neat and attractive and is furnished complete with all fittings for installing. It is patented in this country and abroad and is being marketed here by the G-L Economizer Company, *Times* Building, New York.

G-L FUEL ECONOMIZER.

Bowers Junior Carbureter.—This is a smaller edition of the Bowers carbureter, and, while brought out to sell at a low price, is nevertheless of high-grade make, perfect in workmanship and finish, and, according to the manufacturers, the F. E. Bowers Company, Inc., New Haven, Conn., with the exception of the regular Bowers' carbureter, it will give the greatest economy and flexibility possible. It is designed on the Venturi tube principle, having a vertical tube of this type, thus giving a straight draught through the carbureter. Supplementary air is admitted through an original diaphragm placed over the Venturi tube, this air being controlled by reed or flapper valves of different size and gauge, which, taken in conjunction with the Venturi principle, gives a perfectly proportioned mixture for all speeds. The Bowers junior is small, light and compact in design. The throttle part can be set at any angle and the carbureter can be instantly taken apart without any danger of getting out of adjustment, as the only adjustment necessary is at the spray nozzle for the gasoline. The float chamber is concentric with the nozzle, thus making it impossible for the angle at which the car is running to affect the feed. The nozzle is of the new Bowers atomizer type and the carbureter is completely protected at the air entrance and cannot drip or leak.

BOWERS JUNIOR CARBURETER COMPLETE.

"Watch Dog" Auto Protector.—The Automobile Protection Company, 322 Hudson street, New York City, have perfected a neat and convenient little instrument to keep track of the movements of a car and have very aptly named it the "Watch Dog." It works on the principle of the pedometer and is designed to warn the owner when his car has been taken out of the garage by his driver without permission, but, unlike many of the instruments devised for this purpose, it is extremely small and compact, besides being self-contained. The fact that the illustration shows practically the actual size will give some idea of how very small it really is. There are no driving gears, wires or other attachments, it only being necessary to fasten the "Watch Dog" to the dash or any other part of the car. As it depends for its action upon vibration, and every cars differs somewhat in the amount set up by its running, it is necessary to note the reading of the instrument after having run the car for a certain period. Once this is known, the owner has an accurate check upon his car, as a glance at the instrument will show that it has bene taken out and its reading will indicate how long it was out without his permission. To prevent tampering, the action is protected by a hardened steel ring placed around it and the instrument is permanently sealed in place on the car.

LIFE SIZE CUT OF THE "WATCH DOG."

Siro Carbureter.—In bringing out this carbureter, the makers, the Siro Carbureter Manufacturing Company, 27-35 Taylor street, Springfield, Mass., have made a radical departure from current practice in that all air-controlled valves and diaphragms have been done away with. The entire working of the carbureter is mechanical, so that, once adjusted, it stays that way and there is no need for constant tinkering. The auxiliary air and gasoline valves are so arranged that they open or close a certain distance corresponding to the position of the throttle, so that every adjustment on the carbureter is controlled by a single lever. The peculiar construction of the mixing chamber is said to give a uniform mixture at any position of the throttle, regardless of the speed of the motor, the makers claiming that it is possible to adjust it when on the motor so that the car can be driven from two to three miles an hour up to its maximum speed simply on the throttle. The best materials are used throughout, all fixed joints being pinned and riveted, thus doing away with the possibility of anything slipping. The Siro carbureter is now being manufactured in six sizes, namely, 1, 1 1-4, and 1 1-2 inch horizontal type, and the same sizes in the vertical type. It is instantly adaptable to a large number of well-known cars.

VERTICAL TYPE OF SIRO CARBURETER.

Prest-O-Lite Motorcycle Tank.—A Prest-O-Lite gas tank for motorcycles has made its appearance on the market. Its aim with the motorcycle, as with the automobile, is to furnish "gas on tap," which can be turned on and off like a gas jet. The motorcycle Prest-O-Lite tank stores 10 cubic feet of gas. With the 1-4-foot size of burner, usually employed on motor cycles, this new Prest-O-Lite tank gives continuous light for 40 hours. The size of the tank, 4 inches by 12 inches, makes it small enough to be carried easily. It is constructed of drawn steel of high tensile strength, and is finished in triple nickel plate. The retail price will be $10, and recharged tanks will be obtainable at any of the Prest-O-Lite Company's 2,200 exchange agencies, at about 60 cents.

NEW PREST-O-LITE TANK FOR MOTORCYCLES.

VOL. XIX NEW YORK—THURSDAY, AUGUST 6, 1908—CHICAGO No. 6

THE AUTOMOBILE

LONG ISLAND'S MOTOR PARKWAY GROWS APACE

It is Nothing Short of Marvelous to Watch the Steady Progress in Building the Famous Motorway.

NEARLY 11 miles of the Long Island Motor Parkway will be available for the Vanderbilt Cup race of October 24, next, preceded by an American elimination trial scheduled for October 10. These 11 miles of perfect motor highway, fenced on both sides by heavy wire, will be supplemented by additional adjoining roads until a course of approximately 25 miles will have been secured for the great American derby of automobiling. Formal application for the use of the supplementary roads was favorably acted upon Monday last by the Board of Supervisors of Nassau county.

That the Nassauvians would welcome the running of the race once more over their highways was never for a moment in doubt. Their readiness to grant permission to use 14 miles of the county's magnificent highways in connection with the 11 miles of the Long Island Motor Parkway assured of completion in time for practice for the trials and the race was confirmed by the outcome of the public hearing at Mineola on Monday morning.

Practically no opposition whatever developed, and the Nassau County Supervisors gave their permission. The sole opposition developed centered in one objector, Charles G. Peters, of Westbury, who declared that the damage done by the racers of 1906 to the roads in front of his Meadow Brook estate had not been repaired and further complained of the violation of speed limits during the preliminary practice. The protests of Mr. Peters, however, were more than offset by the advocacy of the race by Charles Christman, of the Central Park Citizens Association, and the unanimous approval of the county land owners present at the hearing.

The formal permission was granted contingent upon the commission giving the county a bond for $25,000, not to be released until all the roads used had been restored to their normal state of repair, which was promptly acceded to by the petitioners as a reasonable demand on the part of the authorities.

Most important, however, of the details of the promotion of the race was the announcement by A. R. Pardington, who made the application on behalf of the Vanderhilt Cup Commission as a member thereof, that 1,200 uniformed and armed men would be furnished to guard the course, in addition to the deputies furnished by the sheriff of Nassau county.

The policy and promise of the A.A.A. that it would not promote or sanction a race not properly policed was thus made good. This policy, be it remarked, has been endorsed at the big road races and hill-

That Stage of the Work Just Preceding the Top Dressing and the Steam Roller which Finishes the Surface.

climbs of the past season to the entire protection of the public. Mr. Pardington further offered to station flagmen at all crossings during practice and racing hours, and to make such other provisions as the safety of the contestants and citizens might demand. Incidentally, the supervisors decided to purchase two motorcycles fitted with speedometers to assist in the arrest and conviction of violators of speed limits on Nassau county roads.

Nor when considering the question of protection must it be forgotten that the 11 miles of the motor parkway, where the majority of the spectators will naturally congregate, will be guarded by a high fence on either side absolutely cutting off the public from access to the course.

More detailed information of the course, built and secured for the running of the race than was outlined in the formal petition to the Nassau county supervisors assures the fastest circuit ever prepared for an automobile road race. Over it an average speed of 70 miles an hour is possible. In fact, the speed limitations of the cars themselves would seem alone likely to measure the rate of going. It looks, in fact, this time to be a new world's long distance record for the mere trying, and a temptation that makers and owners of fast cars on both sides of the water will find hard to resist when they realize what is available.

The route presents few hills of any considerable grade. More than one-half of the circuit is down grade. The balance is practically dead level, and includes 11 miles of specially laid cement highway. The parkway section is dished and banked upon all turns with easy grades approaching public highway and railway crossings. The splendid county and State roads embraced in the course will admit of speed well nigh as great as on the parkway.

A mammoth steel stand ten times the size of former ones is to be erected by the parkway corporation on the south side of the cement stretch four miles from its beginning. It will afford its occupants not only a bird's eye view for the entire 11 miles, but will enable them to see the racers at their highest speed on the easy "S" turns and as they negotiate grades at crossways.

In his enthusiasm A. R. Pardington thinks the parkway worthy of being dubbed "The Plateaux Racing Drome," and is sure the spectator will yearn for a gentle balloon flight of a few hundred feet that would give him a view of the entire race, so free is the course from hills of pronounced grade.

Beginning at the Jericho turnpike and the Old Westbury road, the racers will speed over Hempstead Plains with not a vestige of shrubbery or any woods to cut off the view. The parkway also runs through the same kind of open country, affording an unbroken vision. Leaving the parkway and entering the public road at Bethpage, the racers will encounter Manneto Hill, hardly of sufficient grade to be worthy of a name. Then will come the only stretch of road at all dangerous, and this by reason of the foliage of the Round Swamp and Plainview roads being thick and frequent turns admitting of but a short range of vision. There is ample shade from overhanging trees along the Jericho turnpike, but the road is very broad, permitting a view ahead of ample extent to insure safety in driving.

Along the parkway stretch there are two or three cement bridges, and one span to carry the road over intersecting roadways and low places. The center of the parkway, it may be interesting to note, is being built first to insure early completion and a firm bed. Later, however, the road will be widened six feet on either side.

To describe more particularly the circuit chosen, the boundary of the course is the well-known Jericho turnpike, beginning at the old Westbury road, about three miles east of Krug's corner and running 10 miles east to the intersection of the Woodbury and Hicksville macadam road.

The Parkway Winds Through Some of the Prettiest Farming Country on Long Island, Noted for Its Quiet Beauty.

Showing the Wooden Molds, Mixing Machines for Cement and Stone, and Wire Netting Which Goes Between.

The western boundary of the course is composed of a portion of the Old Westbury road running south from the Jericho turnpike to the Old Country road, and along the Old Country road about an eighth of a mile to Whaleneck avenue, thence south to the beginning of the Motor Parkway.

The southern boundary is made up entirely of the new cement parkway beginning at Whaleneck avenue, and paralleling an abandoned branch of the Long Island Railroad known as the Hempstead branch, for a distance of nearly 11 miles to a small settlement called Bethpage.

The eastern boundary of the course begins at the termination of the cement parkway at Bethpage and runs north along Round Swamp road to its intersection with the Plainview road and along that thoroughfare to its intersection with the Woodbury and Hicksville macadam road, along which it continues to the Jericho turnpike, where there is a sharp left turn known as the "Flatiron." From this turn the course practically coasts westward on Jericho turnpike for 10 miles back to the Old Westbury road and thence south to the beginning of the parkway.

There are eight sharp turns on the State and county road portions of the course, but the parkway turns are all beautifully rounded and banked. The surface of the cement is as smooth as a city concreted street, and the possibilities for high speed are quite enough to satisfy the ambition of the most daring racing drivers in the world.

General Manager Pardington, of the Parkway corporation, who has charge of its building, says that it will be completed in ample time for the American cars to practice for the elimination trials set for October 10 for a few days. The work is distributed among several contractors, each of whom has but a short section of road to complete. All of the crushed stone and cement necessary in the construction is upon the ground, together with the steel netting, which forms the foundation for the cement roadbed. The wire fencing which is to run along both edges has been contracted for. This fencing is about five feet and composed of 10 parallel wires set close together and held in position by vertical wires about 12 inches apart.

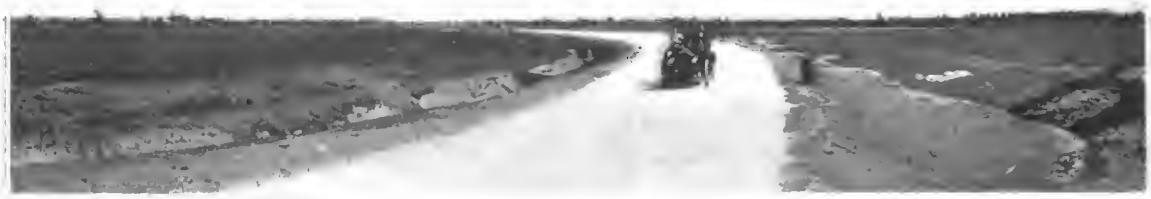
The toll bridges will be completed in time for the race. One of them is located near the Meadow Brook Hunt clubhouse, a fashionable rendezvous for Long Island's elite colony.

The course for the 1908 race is much more isolated than those previously used for Vanderbilt Cup races, in that no part of it passes through a town or village where crowds would naturally congregate.

Frederick Skene, State Engineer and Surveyor of New York State, this week drove over the State roads which are to be used in connection with the cup course, and made some suggestions to Mr. Pardington as to the oiling of the State roads. Mr. Pardington agreed to carry out the State Engineer's suggestions, and at the same time pointed out to Mr. Skene one or two bad places, which Mr. Skene said he would have repaired at once, in order that oiling may be done in September.

Joe Tracy, the Vanderbilt cup driver who made the fastest lap in the 1906 races, has consented, together with two other well-known racing drivers, to make a speed test on the cement road surface of the Parkway within a few days He will drive the Locomobile which he used in the 1906 Vanderbilt. The purpose of the test is to satisfy the Parkway engineers that their calculations on banking and dishing at curves, and on the approaches to viaducts over intersecting highways, are correct, not only in theory, but in actual practice. From the viewpoint of the autoist the test will be of considerable interest, as not only showing what speed will be possible on the cement straightaway, but also the effect of the cement on the tires.

When the Steam Roller Gets to Work It Soon Begins to Make the Parkway Such in Reality.



Completed Section of Parkway Showing Garford Car Making One of the Well-constructed Turns.

PROPOSED SPEEDWAY IN NORTHWEST.

TACOMA, WASH., Aug. 1.—According to present indications, an automobile speedway may shortly be constructed between this city and Seattle. A civil engineer employed by an Eastern automobile manufacturer has been looking over the proposed route and has recommended the investment of $1,000,000 in the enterprise. The road would be built of shells, forming a surface which requires few repairs, and would be divided by a curb in the middle into two pathways for autos going in opposite directions. A small toll would be charged, and the constructing company would maintain garages at each end, where machines could be rented for the trip, which could be made in half an hour.

OKLAHOMA STATE BODY JOINS THE A. A. A.

Oklahoma automobilists have formed a State association of about 200 members, and at a meeting of the executive committee of the A. A. A., held Tuesday last at No. 437 Fifth avenue, New York City, the Oklahoma Automobile Association was admitted to membership as the twenty-fifth State body affiliated with the national organization.

Secretary F. H. Elliott's report showed that 24 new automobile clubs have been added to six of the State bodies during the past month. A long list of individual members, scattered through many States, was also placed on the membership roll.

President William H. Hotchkiss presided at the session, which disposed of a mass of routine matters, and made other plans for the association, which will be announced subsequently and prove of undoubted value to the association. One contemplated move, when it is made known, say the A. A. A. officials, will be received with particular favor and commendation throughout the entire country.

JERSEY CITY TO NEWARK HIGHWAY.

The Boards of Freeholders of Jersey City and Newark have authorized the construction of a broad highway connecting the two cities across the New Jersey "meadows," to replace the old Plank Road. This barren tract, it is believed, will soon be covered with manufacturing plants, and the new road will then become one of the greatest industrial centers in the country. The roadway will be of concrete, 100 feet wide, and will have a new bridge over the Passaic River. Engineers are now working on the plans, and it is hoped that actual construction work will be begun this winter. The estimated cost is close to $1,000,000, of which Essex will pay five-eighth and Hudson three-eighths.

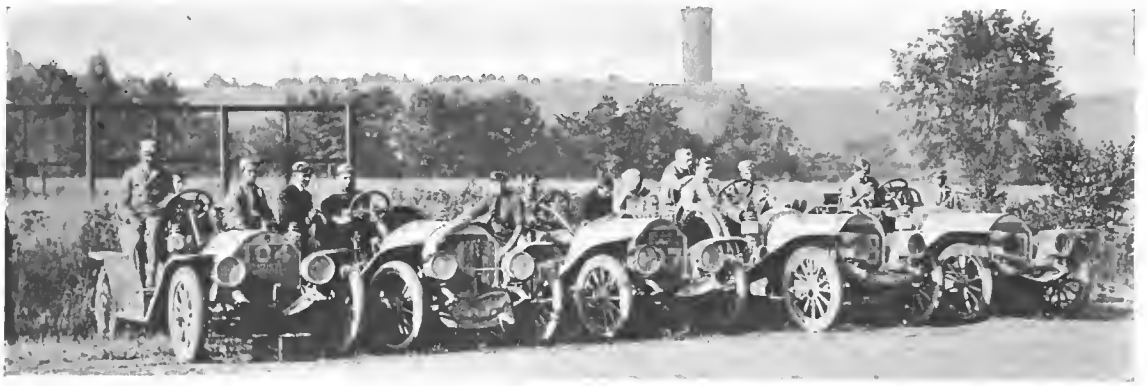
ST. PAUL CLUB IMPROVES ROADS.

ST. PAUL, MINN., July 31.—The Automobile Club of St. Paul has decided to spend the $6,000 which it cleared at the race meet July 15 on improving the roads of this vicinity. Two wagons, manned each by a crew of laborers and a foreman, will be put in commission for the rest of the summer and travel over all the macadam roads around the city, repairing all inequalities.

MORE ARRIVALS BY AUTO THAN TRAIN.

BRETTON WOODS, N. H., Aug. 2.—The two big hotels at Bretton Woods, the Mount Washington and the Mount Pleasant, are receiving more guests who come by automobile than by train. Since July 15 there have been 555 arrivals by auto and only 373 by train. In the garage 123 cars have already been accommodated, many from distant points. With the building of new roads in the White Mountains automobile travel is becoming the preferred method of transportation in reaching this region.

Once More the Jericho Turnpike Is to Be Included in the Famous Vanderbilt Cup Course.



Line-up of the Five Tied Hower Trophy Candidates: Premier, Two Stoddard-Daytons and Two Pierce Great-Arrows.

RUNABOUT TIE RUN-OFF MAKES A PIERCE WINNER

BEDFORD SPRINGS, Pa., July 30.—Of the five runabouts which left Saratoga last Saturday to decide the tie for the Hower trophy, three dropped out at Pittsburg, and the remaining two ended their long trip here yesterday. They were the two six-cylinder Great Arrow Pierces, Nos. 100 and 103, driven by J. S. Williams and Ed. Rettling; the two four-cylinder Stoddard-Daytons, Nos. 107 and 112, driven by G. P. Moore and R. C. Shirk, and George Weidely's, No. 104, four-cylinder Premier. On arrival here only the Pierces were left, and, rather than draw things out indefinitely, R. D. Garden's, No. 100, Great Arrow roadster was withdrawn, leaving Charles R. Clifton's entry the winner. The conclusion of what was generally anticipated to be a long and closely contested run-off came much sooner than expected, the perfect score of the Premier, which had been maintained for the first three days of the run, going by the board on the stretch between Pittsburg and Cambridge Springs on Tuesday, where the car broke its front axle through dropping into a washout. Weidely fixed it and reached Pittsburg in good shape, but was out of the running, of course.

This left the two Pierces and the pair of Stoddard-Daytons, and it looked as if the contest would be continued by these four, but at a meeting of the contestants it was decided to withdraw the Dayton roadsters. The reason for this lay in the fact that the two cars are the property of individual owners, over whom the factory had no control prior to the run-off, and it was in accordance with their wishes that the cars were withdrawn. This eliminated all but the Great Arrow contenders, and the withdrawal of R. D. Garden's entry left Charles R. Clifton's Pierce roadster the winner of the Hower trophy, thus putting an end to Dai Lewis' work in the perfect score two-cylinder Reo of R. M. Owen, which has been acting as a confetti car for the Fifth Annual A. A. A. Reliability Tour.

VICTORIOUS THOMAS RECEIVES AN OVATION IN PARIS

PARIS, July 30.—Nothing could stand out in sharper contrast than the reception accorded the winning Thomas car on its entry into the French capital and that which the Germans received a few days previous. "Vive le voiture Américain!" was the popular cry of the day that greeted the triumphant American crew all the way from Meaux, 25 miles out of the city, where a large escort of cars met them, until they arrived in front of the *Matin* office. When, at eight in the evening, the Thomas, with the Stars and Stripes floating out behind, made its way to the Place de l'Opéra, the enthusiasm was unbounded. In front of the Café de la Paix, a gendarme stopped the car and placed Schuster under arrest for not having a light. Protests and explanations were unavailing. A cyclist offered the lamp from his machine, but it could not be detached, so the bicycle was lifted in the car.

At the *Matin* offices an informal reception was tendered George Schuster, George Miller, Captain Hans Hansen, and George McAdam, staff correspondent of the New York *Times*.

Schuster has suffered severely from the strain of the trip, and would not repeat the experience for any consideration, but he is the happiest man in Paris to-day. "We started from New York February 12, and here we are," he said, when interviewed. "It has been a wonderful journey, but it has been extremely hard, and if it had not been for the life in the open, probably none of us would have been able to stand the hardships. Siberia is certainly no place for the automobile, but it's all over now. We have won, and we are perfectly happy."

NEW YORK, Aug. 3.—Upon receipt of cable advices that the Thomas had reached Paris a winner in the round-the-world race by the ample margin of 26 days, Harry S. Houpt and John Elliott Bowles, who were greatly responsible for the entry of the Thomas car, were the recipients of general congratulations from American automobilists, many of whom declared the trip was the most remarkable evidence of American perseverance and grit and the most conclusive demonstration of the ability of the modern automobile that could be afforded. There is a plan afoot to tender the winning crew a reception on their return here, in order to give the men an opportunity of telling of some of their experiences at first hand to those who have followed their adventures through the columns of the newspapers.

When interviewed at Buffalo after learning of the arrival of the Thomas at Paris, E. R. Thomas said: "In the New York to Paris race, not only an American car, but also American tires scored an important triumph, the Diamond quick-detachable tires used giving excellent service. While the Thomas stock car won the race round the world, covering a distance of 13,431 miles by the comfortable margin of 26 days, it is particularly gratifying to me to know that the car was the only one which went the official route. The Thomas traveled 2,385 miles more on land under its own power, and 3,246 miles more at sea—a total of 5,031 miles more—than its nearest competitor, which shipped from Pocatello, Idaho, to Seattle, thus avoiding the severest portion of the trip across the American continent."

KNOX SCORED IN WILDWOOD STRAIGHTAWAYS

WILDWOOD, N. J., Aug. 3.—The Knox collared everything in sight to-day in the classes to which it was eligible, the Buick getting away with the small car classes and the Stanley having a clear field in the steam events. Between them, Bourgue and Dennison captured seven races with their twin Knoxes, including the free-for-all, in which each won a heat, and in which Bourgue finished second to Dennison. The Knoxes also ran one, two in the mile and kilometer time trials, Dennison beating out his confrère in both in the fastest times of the day—:47 2-5 and :28, respectively. The Stanley was the place car in both trial heats of the free-for-all, but in the final the flying back of the hood of Vennell's car, which had been imperfectly fastened, put its driver temporarily *hors de combat* and rendered necessary the services of a physician to sew up the resulting cut in his head.

The races were not nearly so interesting as those of last Fourth of July, Saturday's rain resulting in the scratching of many entries. The chapter of mishaps, which began with the accident to Swain and Overpeck on Thursday, was continued this morning, when "Dick" Sellers, chairman of the contest committee of the Quaker City Motor Club, had his right shoulder dislocated by being catapulted from the Pennsylvania Vanderbilt car, driven by Richard Williams. While speeding back toward the start the top of the battery box fell into the open machinery and blocked the brake clutch. The choice lay between a dash into the ocean and a sharp turn up a cross street. Williams preferred the latter, and the car turned a complete flip-flop. Seller's dislocation was reduced by a local surgeon. Williams got off with a few scratches.

The course was fast, and, considering the horsepower of the contestants, the times made compared favorably with the :42 3-5 record on the Fourth of July. Following is the summary:

MILE TIME TRIALS. OPEN TO ALL.

1.	Knox	A. Dennison	:47 2-5
2.	Knox	Wm. Bourgue	:48 4-5
3.	Parkin	J. W. Parkin, Jr.	:50 2-5
4.	Sharp-Arrow	W. H. Sharp, Jr.	:53
5.	Buick	Ed. Wilkie	1:08

KILOMETER TIME TRIALS, OPEN TO ALL.

1.	Knox	A. Dennison	:28
2.	Knox	Wm. Borgue	:29 1-5
3.	Parkin	J. W. Parkin, Jr.	:30
4.	Stanley	D. Walter Harper	:31 3-5
5.	Buick	Ed. Wilkie	:41

FREE-FOR-ALL.

(First Heat.)

1.	Knox	Wm. Bourgue	:49 4-5
2.	Stanley	D. Walter Harper	:50

(Second Heat.)

1.	Knox	A. Dennison	:50
2.	Stanley	Walter Vennell	:53

(Final Heat.)

1.	Knox	A. Dennison	:50
2.	Knox	Wm. Bourgue	:50 4-5

FREE-FOR-ALL FOR STEAM CARS.

1.	Stanley	D. Walter Harper	No Time Taken
2.	Stanley	Walter Vennell " " "	

GASOLINE STOCK CARS UNDER $1,250.

1.	Buick	Ed. Wilkie	1:22
2.	Middleby	Wm. Smith	1:22 2-5

GASOLINE STOCK CARS, $1,251 TO $2,000.

1.	Buick	Ed. Wilkie	1:19
2.	Middleby	Wm. Smith	1:19 2-3

GASOLINE STOCK CARS, $2,001 TO $3,000.

1.	Knox	Wm. Bourgue	:54 2-5
2.	Sharp-Arrow	W. H. Sharp, Jr.	:55 2-5

GASOLINE STOCK CARS, $3,001 TO $4,000.

1.	Knox	Wm. Bourgue	:50 4-5
2.	Parkin	J. W. Parkin	:51 2-5

FOUR-CYLINDER GASOLINE STOCK CARS OVER $4,000.

1.	Knox	Wm. Bourgue	:54 2-5
2.	Stearns	H. A. McNichol	:56

SIX-CYLINDER GASOLINE CARS.

1.	Knox	Wm. Bourgue	:50 4-5
2.	Parkin	J. W. Parkin, Jr.	:51 2-5

WILDWOOD, N. J., Aug. 1.—Bad weather and luck have marked the midsummer meet of the Motor Club of Wildwood up to date. The climax came when the officials, after a thorough trial of the Central avenue boulevard course, reluctantly postponed the races scheduled for this afternoon until Monday.

Speeding along the country road between Hammonton and Egg Harbor late Thursday night, ex-President "Charlie" Swain and "Doc" Overpeck, prominent in the Quaker City Motor Club, met with a serious accident, which not only necessitated their removal to the German Hospital in Philadelphia, but spoiled the invitation run from Philadelphia to Wildwood, of which the injured men were to have been the finish judges. Just before reaching Elwood, Swain's Apperson "Jack Rabbit," with Overpeck at the wheel, came suddenly upon a buggy without a lamp, and in his effort to clear it the "Rabbit" struck a muddy spot, skidded into and across the ditch, finally bringing up against a tree and turning turtle. Both men were caught beneath the car, and, with no help near, Swain, with several fractured ribs, managed by almost superhuman efforts to work his way out and drag Overpeck to the roadside. About daybreak Swain went to summon help, and with the aid of a farmer's wagon conveyed Overpeck to DaCosta, where a train from Atlantic City was stopped and the injured taken to Philadelphia.

The news of the accident cast a damper on the invitation run, which, however, was run off as per schedule, and was won by Paul P. Huyette, who drove his 35-horsepower Peerless over the course in the exact time previously agreed upon by the committee, arriving here at 5:15 o'clock in the afternoon.

Threatening weather and the accident combined rendered necessary the postponement of the meeting of protest against the Frelinghuysen law, originally scheduled for Friday night, until to-night. Five hundred enthusiasts, however, were on hand when Chairman Thomas Martindale called the meeting to order. After a comprehensive statement of the present conditions by the chairman, the following resolution was introduced by Carl A. Haswin:

Resolved, That we pledge our united efforts to secure just legislation as well as to remove this oppression and persecution, and be it further

Resolved, That, failing in any other way to obtain the relief which we so much need, we will use our influence to secure the election to the next Legislature of men who will pledge themselves to support what we believe to be just and merited legislative measures affecting motorists, and be it further

Resolved, That we appeal to the press of New Jersey and Pennsylvania to support the motorists in their movement to obtain for themselves a square deal from the Legislature of New Jersey.

In seconding the resolutions Senator J. Thompson Baker took occasion to characterize the present automobile laws of New Jersey as "a disgrace to the fair name of an illustrious commonwealth." Secretary Edwin S. Nyce, of the Norristown (Pa) Automobile Club proposed that all manufacturers of automobiles and accessories in New Jersey be asked to financially assist in fighting the present law. The proposition was favorably received, after which many present, including the winner of yesterday's run, Paul B. Huyette, detailed their experiences with the present law. He said he had been arrested but once—in New Jersey.

ANOTHER FRENCH COMMERCIAL VEHICLE TEST.

PARIS, Aug. 1.—France is to have another commercial vehicle competition this year, the special type of automobile provided for in the recently announced contest being light delivery wagons, taxicabs, and hotel and railroad omnibuses. The competition was originally announced early in the year by two Parisian journals, but on the request of the Automobile Club of France, which had its own trials in view, was indefinitely postponed. The date has now been fixed for the month of October, the exact date and conditions to be announced later.

Ferber Aeroplane Making One of Its Successful Trial Flights at Issy-les-Moulineaux, Near Paris.

FERBER AFTER DELAYED HONORS.

PARIS, July 30.—Captain Ferber, the French aeronautical army officer who put both Delagrange and Henry Farman on the road to success in the matter of aerial flight, has just brought forth his own flying machine. The apparatus, which made its first public appearance at Issy-les-Moulineaux last week, was first built in 1904. Various difficulties prevented it being brought before the public, and in the meantime Farman and Delagrange became interested and had similar models constructed, with success so familiar to all the world. In November, 1906, Ferber's machine was lying at Chalais-Meudon waiting for suitable weather for a flight, when orders came from the military authorities that the ill-fated dirigible *Patrie* was en route and room must be found for it in the shed. The Ferber aeroplane was consequently turned out of doors, to perish miserably a few days later in a violent storm.

Annoyed at the loss of his apparatus, Captain Ferber asked to be put on half pay, and since then has been privately at work on various aeronautical devices. The machine which came forth this week is the reconstructed *No. 8* lost in the November storm of two years ago and in general lines is similar to the now familiar Farman and Delagrange flyers. The raising and lowering rudder is in front, a horizontal and vertical rudder is carried at the rear, and at each extremity of the main plane is a jib to facilitate turning. The motive power is a 50-horsepower eight-cylinder Antoinette engine driving a two-bladed propeller forward. The pilot sits behind his engine on a swinging seat composed of two leather straps. After the preliminary trip to test the various parts, the captain will commence a series of flights in which he hopes to beat his younger rivals.

The most noticeable difference between the Ferber and the Farman machines is in the location of the engine and propeller. Ferber's engine carries the propeller on the front end; Farman's, on the rear, this seeming a much more natural arrangement.

FARMAN DOES SUCCESSFUL FLIGHTS.

After some quick work in setting up and tuning his aeroplane, Aviator Henry Farman made his first flight in this country Friday, July 31, before the members of the Aero Club of America and a number of pressmen. The field of the Brighton Beach racetrack was not in the best of condition, several gullies having been roughly boarded over and a pile of lumber having been left in one corner. The wind currents, too, were very irregular. In spite of these drawbacks Farman made two flights of several hundred yards each diagonally across the field, at a height of about fifteen feet. The third flight he made to oblige a disappointed photographer, and many thought it the prettiest of all. He simply started the engine and the machine jumped into the air, with only a few yards preliminary run.

A large crowd turned out Saturday to see him fly, but were disappointed. The wind was blowing half a gale, and, although the aviator waited until sunset, it did not go down sufficiently to make any attempts advisable. Sunday conditions were better, although by no means ideal, and the aviator again made several flights diagonally across the grounds. The next day he increased the distance; after flying about 300 yards straightaway he swung the machine around in a large arc toward the stands, covering altogether about 800 yards. In another flight he attained a height of about 30 feet, and came down smoothly and without a hitch. The perfect control Farman had over the aeroplane was noticeable on all occasions.

By way of description it may be said that the machine is 32 feet across the wings and about the same length from the front balancing plane to the tip of the tail. The aviator sits at the junction of the wings and tail, and controls the direction and elevation by a steering wheel. Just behind him is the motor, an eight-cylinder, 50-horsepower Antoinette, with a two-bladed propeller mounted directly on the rear end of the crankshaft so as to enable it to exert its force directly backward.

Captain Ferber, Originator of the Farman Type of Aeroplane.

Henry Farman Alongside His Aeroplane at Brighton Beach.

AMERICA AGAIN WINS HARMSWORTH TROPHY

IN a closely contested and exciting race in Huntington Bay, L. I., Monday, August 3, the *Dixie II.* beat the English challenger, *Wolseley-Siddeley*, and won the right to keep for another year the British international motorboat cup, usually known as the Harmsworth trophy, and open to all comers.

Five boats started in the race: the *Wolseley-Siddeley*, owned by the Duke of Westminster and captained by Noel M. Robbins; the *Daimler II.*, of Lord Howard de Walden, another challenger; E. J. Schroeder's *Dixie II.*, Capt. S. B. Pearce; Capt. John Sheppard's *U. S. A.*, formerly the *Irene;* and the little *Den*, entered by Commodore Joseph H. Hoadley, of the Motorboat Club of America. The course was triangular, running out to a stake boat in the sound beyond Eaton's Neck, then west along shore to a mark off Lloyd's Neck, and then back to the starting line in Huntington Bay; it was circled three times, making thirty nautical miles in all. The *Dixie's* official elapsed time was 1:04:57, to the *Wolseley's* 1:05:46; the averages figure out at 27.75 and 27.35 knots an hour, respectively.

"Dixie II," the New Cup Winner.

Instead of the forty-mile norther that caused the postponement on Saturday, a light easterly breeze was blowing across the bay, just strong enough to raise a few whitecaps; the water was a blue as deep and clear as that along the Riviera, flashing in the bright sunlight. All the terraces and the bluffs around the harbor were crowded with spectators. At 2:30 o'clock, the time set for the start, all the racers were under way and moving about waiting for the signal. At 3 o'clock the signal whistle finally blew. Captain Pearce, of the *Dixie,* took up a position just behind the line, and when the starting signal was given he jumped the boat ahead and got across just 14 seconds later. The *Den* made a quick start and was next over, closely followed by the *Daimler* and the *Siddeley;* the *U. S. A.* was late, owing to a slight accident. Two minutes after the gun the racers were far out in the bay, and could only be distinguished by the waves they threw up. At the first stake the *Dixie* had kept her lead, but the two English boats had passed the *Den* and were close behind. On the westerly leg the *Daimler* showed good form and gained about three lengths on her sister boat, but soon after rounding the buoy a piston in the starboard engine seized and she failed to complete the first lap. The *Dixie* passed the stake boat 37 seconds ahead of the *Wolseley*, and Engineer Rappuhn signaled that the wheel was turning only 750 revolutions a minute, 150 short of its maximum, showing that she had a good reserve.

On the second lap the *Wolseley* did her best work, and gained 21 seconds. Coming down the last leg Captain Robbins held straight to his course and flashed past the stake boat in a cloud of white spray, with only a few feet to spare. But before the first mark out in the sound was reached the *Dixie* was again increasing her lead, and try as the English boat would the gap between them grew larger. As the *Dixie* came down to the finish she seemed to be steering a trifle wild, and then the watchers could see that Captain Pearce was dashing water upon his mechanic with one hand while he held the tiller with the other. She crossed the line 49 seconds in the lead. A number of small boats with doctors on board immediately put off to her, and it was found that Engineer Rappuhn had been overcome by breathing the exhaust gases from the engine. A moment later Captain Pearce toppled over also, but both revived when carried ashore, and suffered no ill effects. The trouble was due to the position of the muffler, which had been hastily installed just before the race. Captain Robbins, of the crack British boat, took his defeat philosophically, and admitted that the best boat won. Summary:

The "Wolseley-Siddeley," Which Finished Second by 49 Seconds.

Boat.	Elapsed Time.	Knots per hour.	Miles per hour.
Dixie II.	1:04:57	27.75	32.00
Wolseley-Siddeley	1:05:46	27.35	31.05
U. S. A.	1:15:11	23.90	27.65
Den	1:20:47	22.50	25.65
Daimler II.	Disabled.		

Ex-Commodore E. J. Schroeder, of the Motorboat Club of America, won the trophy last year with the *Dixie I.* When he received the English challenge this year he commissioned Clinton H. Crane to make him a new boat. Crane and Whitman built the motors, and Frank Woods the hull. The *Dixie II.* is 49 feet 6 inches long, and her engines develop 200 horsepower. In a mile speed trial over a measured course the day after the race, the *Dixie II.* made a speed of 36.4 nautical miles per hour, which shows how much better she could have done, if pushed.

CARS FOR PASSENGER USE IN AND ABOUT CITIES

THERE is a very close line of demarcation, as yet barely recognized, between the vehicle popularly known as the taxicab and the town car. At the same time full appreciation is given the fact that certain manufacturers advertise their goods simultaneously as taxicabs and town cars, and undoubtedly they themselves are versed in the existence of the difference between types which they would familiarize as synonymous. It is equally certain, though, that there are very many individual concerns in the industry, to say nothing or laymen, who have no real conception of the differences demanded by circumstances and by service from vehicles that ply for hire within a city and its environs and a private carriage for use in the same neighborhood. Probably a tabulation of the differentiated requirements will be the best means of bringing the conditions forcibly to the mind of the reader. Scanning such a tabulation we find:

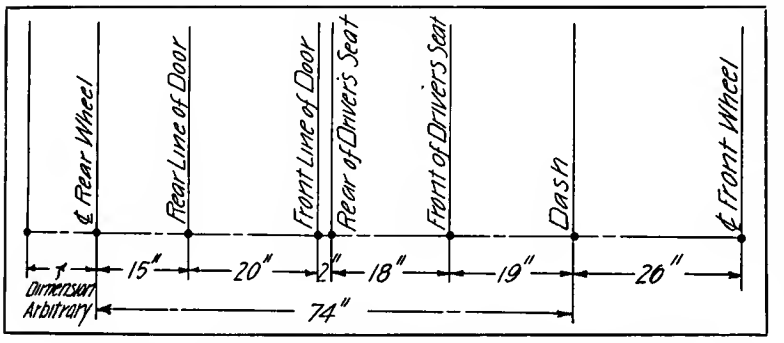


Fig. 1.—Showing a permissible wheelbase of 100 inches in the layout of a cab chassis.

REQUIREMENTS OF THE TAXICAB.

1. It must be eminently serviceable and in lieu of absolute reliability must be easy of immediate repair.
2. It must comply with police regulations regarding turning radius.
3. Of reasonable comfort and capacity; appearances are secondary to certain other considerations.
4. Its internal operations must be entirely automatic to avoid trouble with unskilled treatment.

FEATURES OF A STANDARD TOWN CAR.

1. While reliability is essential, means for rapid handling of repair are hardly as important.
2. There are no police regulations on its construction or performance.
3. Maximum comfort for rated capacity is absolutely essential.
4. Appearances are everything.
5. Its cost is comparatively immaterial.
6. Better treatment can be counted on.

Thus the designer is confronted with two entirely different problems—the one calling for serviceability above all things and the other for extreme luxury under all conditions. It is, of course, rash to aver that the two cannot go hand-in-hand, but it is not injudicious to state definitely that the requirements of a town car de luxe cannot be satisfied by the dimensions which have been relegated to the taxicab for hacking service.

Examine the limiting factors in both cases. The regulations of the administration call for the vehicle plying for hire turning within a fixed radius of such small dimensions that wheelbase is especially restricted. Wheelbase being restricted, each and every one of the items of the make-up must be proportionately restricted unless internal sacrifices of space are made. Hence, wheelbase is the determining point of a taxicab design, nor does any specified form of steering help to release its control of the situation inasmuch as the maximum angles of steering wheels are defined by inflexible dynamic considerations.

What May Be Deemed Essential in the Town Car.

Follow now the case of the town car and its requirements. What is the first desideratum? Undoubtedly capacious comfort, or comfort and capacity equal to that of the vehicle in the place of which it substitutes itself—the private brougham. No governmental restrictions are incidental to the use of a town car, hence there are no wheelbase dimensions which cannot be exceeded at the discretion of the designer. Above all, the town car is a carriage, and as a carriage it is the luxurious perquisite of a class of people having educated discrimination between the seemly and the unseemly in the art of outline—the limitation of service and the taste of their possession in a vehicle that must be designed as much for one as the other.

These things it is eminently essential that the would-be producer of town carriages should remember, for, bearing them in mind, he must necessarily commence the laying of his design upon foundations which will appeal to his mechanically educated senses as more than premature. In other words, he must start with the carriage and duly build his propulsive mechanism about it—a truly revolutionary suggestion to the motor car designer, though less startling at the present time than some two or three years ago.

Head room and leg room, door space and floor height, seat location and cushion bulge—all these things have been developed by many generations of carriage builders, and if so why seek further for information? Ask any of the first-class carriage builders whose names are household words in the class whose trade you are after what they consider the ideal design for a brougham, a coupé, a victoria, or whatever you desire to build. Let them define what they, with years of experience of a trade into which you are about to break, would consider the perfect vehicle—a *chef d'œuvre*—and from the results of decades of cut-and-dried methods that will be so unobtrusively correct in these details of dimension so difficult to develop or steal that there is no need to seek further or waste another decade in research work after that which is already so well known as to be standard.

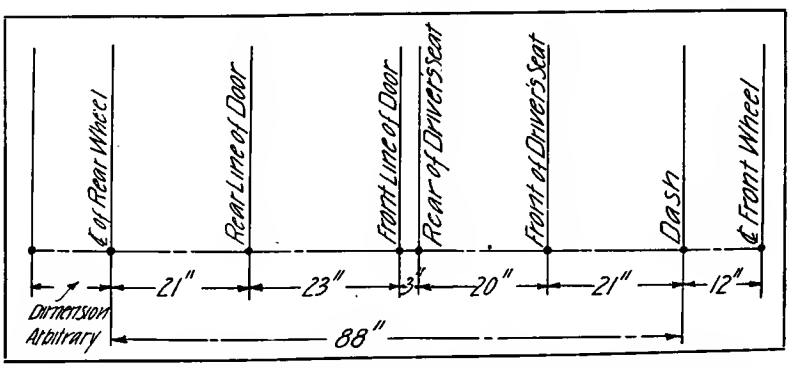

Fig. 2.—Morris chair effect given to driver's portion of body built on century wheelbase plan.

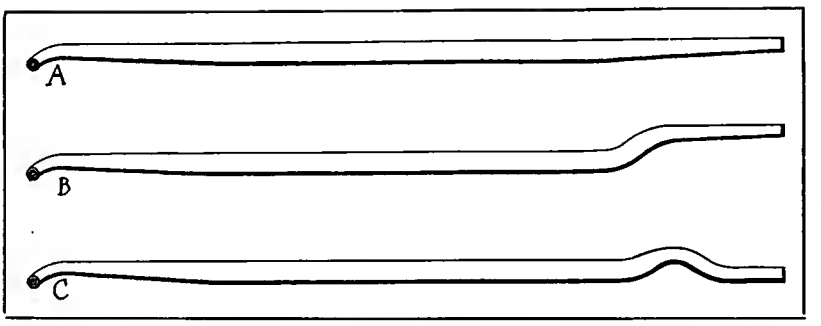

Fig. 3.—Showing three types of frame design applicable, each having specific uses.

Chassis Should Meet the Requirements of Body.

Mark well in this, that the way to secure such data is not to supply a chassis and demand a perfect body built to it. Such a procedure will only call forth much unnecessary exercise of ingenuity upon the part of the carriage designer who will do his best and at that produce work unsatisfactory to himself. Secure as a starting point the ideal lines by a master of the approach to perfection in the passenger section of the vehicle; forget the driver, the driver's companion, luggage accommodation, accessory attachments—be oblivious of all these disturbing elements—and then, having secured the nucleus—the pearl of desire—commence to construct about it, by synthesis as it were, the oyster necessary to bring its being in the shape of a suitable chassis.

The critic may aver: "This is only an assertion; how can I be expected to work a chassis around a carriage builder's job? Why, if they had their way," etc. Too frequently the carriage builder, left to his own devices to avoid some crook of design, for which he is not responsible, perpetrates abominations; but left to his trade the carriage designer has a respect for purity of line, complementary angles and supplementary curves, mingled with an honor for re'entrant tendencies that invariably eventuates in a simple beauty rarely noticed where his work is curbed by lines created and abhorrences forced upon him by unbending circumstances.

Where the Town Car Differs from the Taxicab.

And having secured the ideal for the part that matters—the carriage—it is really quite easy to do the rest. "Quite easy," is said advisedly, for it must be so relatively speaking, when one considers the extraordinary amount of ingenuity misplaced in getting around things to use some idea or other which is really not worth while anyway and certainly not vitally important as is the carriage arrangement of the vehicle, the alpha and omega of whose purpose is that of a town carriage, whose very acquirement indicates a desire for luxury.

Possibly the difference in the manufacture of the town car and the taxicab may be described by indicating the difference in the buyers of each. It is mind and matter respectively. Ten to one the town car customer is appealed to by the style, the taste, the color, some fittings—by detail only; in other words by a chimera. Is it not a matter of record in 90 per cent. of the cases the women swing the sales? Not so with the taxicab buyer. In vulgar parlance, "he's from Missouri," and when he takes his demonstration he's not very anxious as to the taste of the make-up. What he wants to find is value, not toilet glasses. It's dollars present and dollars prospective with him, and he doesn't give the proverbial tinker's curse for the art of the thing. What he wants is results. So does the buyer of the carriage; but he likes a lot of art on the side as well.

Elements which are essential to a good town car are almost undesirable in a taxicab. Thus, comfort for capacity is a *sine qua non* with the town car, but tends to overloading with a taxicab. And, although a taxicab should be sufficiently roomy, the fact that it is included in the class of vehicles that ply for hire renders it equally liable to the shopping tour of "miladi" at noon and the rowdy pack at midnight, the last mentioned fare being apt to be weighty and undesirable from more points of view than just its own discomfort.

Hence the existence of the line of demarcation, already spoken of, will be generally acknowledged by those who will consider the matter, and therefore it is meet to proceed to dissect differences to the point of diversity of practice, for with vehicles differing so widely the mechanical practice must of necessity vary to a certain degree. In the first place, the town car must obviously be the more powerful, for, with greater wheelbase and more commodious body work, its weight calls for a higher engine capacity. Also, since there is a possibility that the chassis work may have to adapt itself to the body work, rather than vice versa, some specialized constructional scheme may be necessary that is not involved in the taxicab layout. These are all considerations that must be taken into account in the design of these small vehicles for urban service, whether of a public or private nature and particularly in the latter case.

Clearance of Taxicabs an Important Consideration.

Next comes the all-important mention of road clearance, a question the solution of which is attended by no mean difficulty, inasmuch as it should be low—close lying to the road surface, the vehicle for town use has yet to contend with conditions from time to time which demand that it shall be possessed of ample clearance. This difficulty presents itself and, insidiously tardy in the forcefulness of its realization, is a real nightmare to the designer, who finds himself faced at every turn by troubles directly traceable to the necessity of this clearance. Thus a straight line drive is not only desirable but well-nigh essential for a chassis to operate efficiently and continuously without either undue power loss or extraordinary wear. Also, it is injudicious for obvious consideration to raise the frame of a city vehicle further than 25 inches from the road surface, this dimension being arbitrary irrespective of wheel diameter.

Considering 34-inch wheels as the maximum size likely to find favor in the eyes of the designer and producer, and a straight line drive parallel with the line of the frame, it will be obvious that the clearance with a normal flywheel is somewhat low. What alternatives

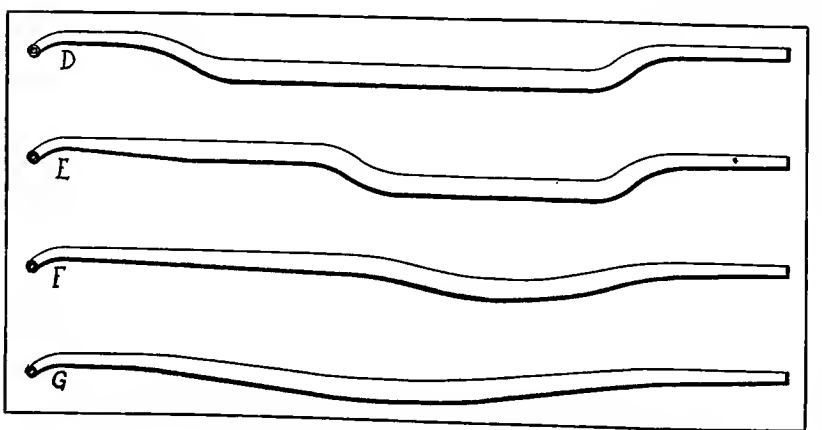

Fig. 4.—Four varied types of double drop frame design, showing the possibilities.

present themselves? The engine may be raised at the expense of angularity being introduced in the propeller shaft; an inclination may be given to the engine to correspond with an inclination of the driving axis sufficient to provide the clearance beneath the flywheel, this being one of the most important problems of the design.

Some Characteristics of the Main Chassis Types.

Figure 7 shows an arrangement entirely conventional, very common and as reprehensible as frequent. So much has been written upon the loss of power in transmission through universal joints that the writer feels it unnecessary to emphasize the undesirability of such an arrangement. Figure 6, depicting the inclination of the whole driving axis, is excellent in many ways, has many ramifications which we will look into later, and, provided certain conditions are not complied with, remains by far the most generally satisfactory way out of the trouble. The last solution is, to the writer's mind, the best of any, but of this more later, as there are coincident reasons which will appear later in this monograph. Regarding ramifications of the inclination system of providing a sufficiency of clearance there are two which are deserving of close attention, namely, that used respectively by the Rover company in England and the Nordyke & Marmon company in this country.

Fig. 7 will make this modification clear and its commendable points are not few. Fig. 7 illustrates the direct adaptation of the inclined drive to a construction such as shown in Fig. 6. This latter is probably the better for all-round work and for manufacturing purposes. In either case the clearance beneath the flywheel is easily modified to suit any limiting conditions existing, so the real issue is to investigate the influence of the inclination to the functions of the motor. The only difficulty lies in the problem of the lubrication, and in the selection of a lubrication plan which is independent of the inclination of the crankchamber. With a single-cylinder motor almost any system would be satisfactory; with a multi-cylinder engine it will be evident that the auxiliary splash system—so often the only system—is almost out of the question, inasmuch as the rear cylinder would normally be in a state of oil flood while the forward ones starved, causing the motor to seize.

It may be argued that individual compartments to the crankchamber would supply the want. With an overflow system in conjunction with a pump feed it might do, but from the point of view of economics results against installation expense. A complete force feed system is preferable, making the motor entirely independent of position under any conditions.

The Century Wheelbase as a Ground of Basic Design.

Basing the layout of a cab chassis upon a permissible wheelbase of 100 inches, it is easy to determine the proportioning of the space from rear frame bar to dashboard, which can be approximately ascertained by a glimpse at Fig. 1. According to the hypothetical dimensions shown the body builder has 74 inches from the rear face of the dash to the center of the rear wheel, and whatever over this he thinks he can do with. These dimensions are modified somewhat in Fig. 2, which is a series of dimensions which would accommodate an uncramped coupé body. Here is a dimension of 88 inches from dash to wheel center or a matter of 14 inches in wheelbase, all other conditions being the same as in the former.

In the case of the cab chassis the dimensions shown are not capable of any wide range of variation, nor

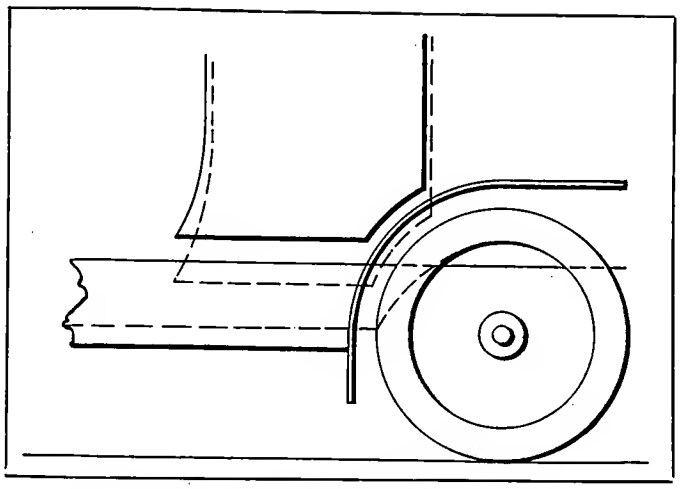

Fig. 5.—Location of door when a straight frame is used.

is such a machine a dream of comfort from the driver's point of view. On the other hand, economy of driver's space is absolutely necessary to give any kind of door room.

Now in the dimensions shown a Morris chair effect is given to the driver's portion of a body built to the hypothetical dimensions in Fig. 2. A low slope to the footboard is indispensable and the seat must be at least 16 1-2 inches high to the top of the cushion from the floor line, this latter, of course, being determined from chassis design; but there is ample room for a good door, sufficient space to prevent the use of a concave corner to the door for fender clearance being necessary and sufficient room between door and rear wheel center necessary to insure a minimum overhang of body with reasonable regard to economy of wheelbase. The ideal would be to have the frame rear bar about two to three inches inside the rear wheel center, but then the wheelbase immediately ascends to a figure that is impossibly high for the purpose in view.

Desirability of the Low Body Carriage.

Now go further and examine the diverse problems in the process of the selection of a frame design. Figs. 3 and 4 reveal known types of these: *A* is the ordinary straight frame—excellent and by no means impossible of utilization. *B* is the single raise, or, as is commonly known, the single drop frame, the rear end being raised to give clearance to the rear axle. *C* is known as a "kicked" frame and is simply a straight frame with clearance provision. *D* is the crude form of what is known as the "double drop frame," depressed to lower the center of gravity of the assembled machine and raised again for clearance purposes. *E* is a similar form but depressed only for the body space. *F* is a very highly developed form used by a few European firms and by one well-known American company. *G* is a type unknown but probably nascent, since it would be much easier of manufacture than either of the others.

Now it will be obvious to the reader that it is a quite desirable

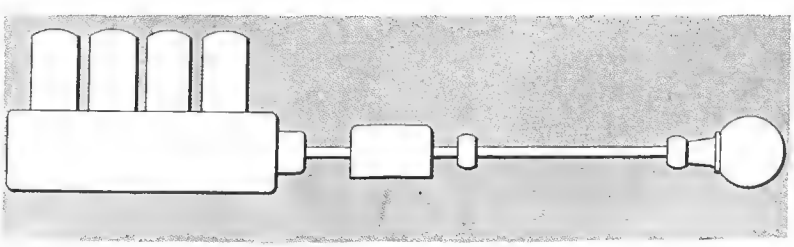

Fig. 6.—Straight line drive direct from motor to rear axle.

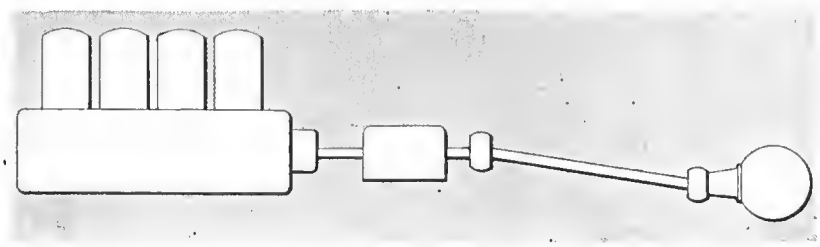

Fig. 7.—Conventional transmission arrangement with universal joint.

thing to secure as low a body suspension in conjunction with reasonable clearance, and consequently frames such as indicated in the series *D, E, F* and *G* are desirable from this point of view. On the other hand, they are more expensive to press, less strong and, lastly, more expensive to assemble. But these matters are more than compensated for by the scope provided for the designer to accomplish beautiful carriage lines—low suspension—and to abolish running boards. This for the town car. With the restricted wheelbase of the taxicab the only possible frames of this pattern are those shown at *E* and *D*. The depression of the center of gravity preserves the appearance of the machine when complete except that a running board would be dispensed with. It strikes the writer that the straight frame, stronger and cheaper as it is, has claims not to be superseded. By straight frame in this connection is meant either of the frames shown at *C, B* or *A*, with due regard to the pattern of spring suspension which may be employed.

It will be readily appreciated that the double drop frame is not easily to be employed for taxicab chassis when the relation of the door to the wheel fender is considered. Thus in Fig. 5, a straight frame being used, the door may be located as shown by the full lines, whereas a drop in the frame lead, the wheel and fender remaining as before, the designer immediately encounters an interference of some magnitude which can be avoided only by an increase of wheelbase if other dimensions are fixed. The conclusion that the straight frame is the only possible type for cab construction has been borne in forcibly upon the writer only after a very close investigation of conditions, possible variations in existing systems and costs involved in a successful design and conclusion equally strong in favor of the cradle frame for town cars has been reached.

In the Matter of the Transmission Types.

Pass to the transmission system. There are three fundamental arrangements possible—planetary transmission or sliding gears for the speed-change, and the location of either in a separate unit just back of the motor, or in combination with the rear axle.

It is eminently desirable that a vehicle for town use shall have four speeds, for not only is its power limited by reason, but the call for rapid acceleration is more frequent than with a vehicle primarily designed for open road work. Highly developed accelerative properties in a motor car speak of two things—extraordinary engine power or nice proportioning of gear ratios. The old and foolish idea that a machine having two speeds only can reach its maximum speed as quickly as another of similar power with a plurality of speed changes has died a quiet death, even as the two-speed fetish has subsided. The three-speeded car, even with six cylinders, is to be replaced by again having four changes in many cases. These things spell retrograde evolution to the theorist but satisfaction to the operator.

This leads back to the old standby, sliding gears, and it is necessary to decide first what ratio to adopt for the relation of the speed change to the drive. Figs. 8, 9 and 10 show some constructions possible with a conventional engine location. In Fig. 8 is seen the usual common or garden construction, the only variant of which lies in the use of a single universal joint in place of two. In Fig. 9 there is another conventional scheme in which the transmission is grouped about the rear axle center, and in Fig. 12 is a somewhat unconventional assembly in which transmission and axle are in unit form, but in which the transmission is grouped about the forward end of the propeller shaft. The problem then is to distinguish between the merits of the following alternative systems:

1. Arrangement such as shown in Fig. 8:
   A. Gearbox being entirely separate from engine.
   B. Engine and propeller shaft as a unit.
   C. Axle and propeller shaft with its housing as a unit.
   D. Propeller shaft as a unit in itself with supplementary radius and torque rods.
   E. Engine, gearbox, propeller shaft, housing and axle as a unit.
2. Arrangement such as shown in Fig. 9 subdivided as follows:
   A. Axle and transmission as single unit propeller shaft supplementary with radius and torque rods.
   B. Axle, transmission, propeller shaft and housing are one unit.
   C. Engine transmission, propeller shaft and housing as one unit.
3. Arrangement such as Fig. 10 with:
   A. Transmission, propeller shaft, housing and axle as a unit.
   B. Engine, transmission, propeller shaft, housing and axle as a unit.

Now if this tabulation be inspected it will be seen that the highest development in each individual system leads to the same conclusion, which conclusion coincides with that reached in course of discussion on clearance, wherein the inclined system either with its components assembled as a unit or in flexible mounting was outlined as the most likely type.

CALIFORNIA ADVANCED IN MOTOR FARM MACHINERY

By VICTOR LOUGHEED.

FROM the dawn of history the necessity for animal power in tilling the soil has been the heaviest burden on agricultural enterprise, subjecting it to uncertainties and a severity of labor through which, despite its fundamental importance to human welfare, it suffers by comparison with the more business-like organization of most other industries. Recognition of this great handicap upon what is the most vital and important source of the prosperity of nations has for some years been the inspiration of one of the most cherished dreams of automobile enthusiasts and progressive farmers alike—that the time is nearing when motor traction, in the form of automobile plows, harvesters, mowers, and the like, will give final and effective answer to this problem of the ages.

The nearness of this ideal to practical realization, however, is not generally appreciated even by those closely in touch with the main trends of automobile development, this being due not so much to lack of discernment as to lack of interest on the part of those more directly concerned with improvement in pleasure and commercial vehicles of the established types. For this reason it would come as a surprise to many to learn what a really large measure of success has already attended the working out of farm tractors and similar agricultural implements, numbers of which have been actually on the market and in severe service for some time. One of the most practical among those of recent appearance is the machine illustrated herewith. This machine, like most successful ones, is a highly specialized device, originally designed to meet peculiar local conditions—in this case the tilling of the orange orchards in the famous citrus belt of Southern California.

It is not widely known, though no less a fact, that the Golden State is an undoubted pioneer in machine harvesting—traction engines having been used in the San Joaquin Valley wheat fields for at least twenty-five years, in the production of crops from the thousands upon thousands of level acres upon which the fame of this great valley is founded. So far, most of these engines have been ponderous steam affairs, of prodigious weight and size, ranging up to twenty-one tons, and to such dimensions as twenty-four feet in over-all length, fifteen feet of width, and a height of twenty feet. Driving wheels eight feet in diameter, geared to a 110-horsepower engine, are a commonplace feature, and explain an ability to tow heavy loads over rough ground that is little short of amazing. Plows turning thirty-six ten-inch furrows at once, and harvesters heading, threshing, and sacking sixty-foot swaths from a wheat field are easily pulled by these machines. As tractors, loads of ore and lumber aggregating seventy-five tons are hauled on two or three trailers, while as much as thirty-five tons can be freighted up a fifteen per cent. grade. When it is considered that all this is not merely in the way of supplanting the horse, but in work for which the equine proves absolutely inadequate and unavailable, something of the attitude of California's bonanza ranch owners toward farming with power will be appreciated.

In the more recent exploitation of this field with internal-combustion engines, in which the Pomona Manufacturing Company, of Pomona, California, are the pioneers, the greatest demand seems to be for five or six-ton machines, of a compactness and simplicity not realized with the steam plants. By development in this direction, moreover, the advantages of traction plowing and cultivating are not only brought to the more numerous smaller land owners, but new possibilities are opened up in the field of orchard plowing, in which the great height and bulk of the steam machines are prohibitive.

Plowing Six Furrows at One Operation with One of the Specially Designed Auto Farm Tractors, in California.

These considerations have been the predominating influences in shaping the designs of the new gasoline machines pictured herewith, which are built with especial reference to use in close quarters and under the branches of trees. The lighter model, for example, is only five and one-half feet high, thirteen feet long, and less than eight feet wide, yet it has ample traction for plowing ten furrows at once in ordinary ground. The motive power so far has been supplied with ordinary two and four-cylinder four-cycle engines, of heavy marine and truck types, but experiments are now under way that in the very near future will lead to the use of lighter and more powerful engines, more nearly conforming to the most advanced automobile practice. The weight of these machines ranges from five to seven tons, with from thirty to fifty horsepower.

A heavy wrought and cast-iron frame forms the foundation of each vehicle, which is carried on four wheels—though the

Auto Farm Tractor as Seen from the Front.

two steering wheels practically amount to a single wheel, made in two adjacent sections to facilitate turning. The driving wheels are five feet in diameter and thirty inches wide, while the front wheels are each three feet in diameter and one foot wide. Their arrangement is such as to afford a three-point support on the ground, with the further advantage that the front pair track exactly the space between the two rear, so that all the ground is subjected equally to the rolling and flattening effect—beneficial in that it crushes clods and leaves a surface well adapted to conserve moisture. The steering wheels are each in one piece, of cast iron, and each has a circumferential rib to prevent side slipping. The rear wheels have been made of wrought and cast-iron elements in combination and of cast iron alone, but preference is now given to the latter construction, provided with suitable transverse ribbing to assist traction.

Steering is by means of a turntable ring surrounding the front wheels, carrying their axle, and arranged to revolve on a ball circle placed in a similar ring integral with the frame. By this construction the objectionable height that would be inseparable from any overhead-pivot construction is avoided. The steering post, which is considerably raked, bears at its lower end a worm meshing with a worm gear borne on the upper end of a short vertical shaft. On the lower end of this shaft is a drum that drives the steering turntable by means of a wire cable. In this way irreversibility is provided and reduction enough to afford ample leverage is assured.

The final drive is from pinions on a countershaft to large spur gears on the wheel hubs. At the center of the countershaft is a differential of regulation type, to the housing of which the drive is by another spur-gear set. The change-speed gear affords four speeds forward and two reverse, and consists practically of two separate sliding-gear systems, each affording two changes. One of these systems is made to shift while running, and the other practically amounts to an alternative final-drive ratio, capable of being changed from one setting to the other only while the machine is standing. A decided novelty of considerable interest as a means of evading an otherwise serious problem is the use of a momentum element in the transmission to keep the vehicle moving during gear manipulation. A multiple-disk clutch is used, thoroughly fool-proofed by enclosure in an oil bath protecting it from dirt and mud.

The working speed is from two to three miles an hour, anything in excess of this being found unsuitable for plows and other implements as at present constructed, though there is a strong probability that the development of motor machines in this field may lead to the design of implements that will work at higher speeds than the present types of horse-drawn devices. For traveling to and from the fields a road speed of five or six miles is provided, and this is also practical for traction work.

To combine a maximum of utility with a minimum of cost, standard coupling devices have been worked out to admit of the attachment of any sort of trailer to the tractor. Among the classes of machines thus arranged for there are—besides plows, seeders, and harrows for preparing the ground and planting grain by a single operation—various tools and trailers adapted to orchard cultivation, furrowing for irrigation, hauling fruit to packing houses, etc. For beans and some other crops a combined tool may be used, consisting of cultivator teeth to loosen the ground, weed knives for removing undesired growths, and smoothing teeth for pulverizing and finishing the ground ready for the planting of the crop.

To the field of road work, in which such great interest has been awakened of recent years by automobile users and other advocates of good highways, important applications of the new tractor are expected. Not only is it suitable for hauling plows, scrapers, and graders of the various types used in road-making, but its broad wheels, tracking heavily the whole width of the vehicle's tread, do away with the necessity for specially-built rollers, every purpose of which they fully serve, so that machines of this type will undoubtedly come into general use for road construction and repair work in this country within a comparatively few years, at the most.

EXPORTS FOR 1908 A SUBSTANTIAL FIGURE.

During the course of the last twelvemonth, ending with June, which terminates the government year, American manufacturers sent abroad no less than $4,656,991 worth of automobiles, and $620,856 worth of automobile parts, making a total of $5,277,847. Owing to the slight falling off that has been apparent in the returns of the past few months, this does not come up to the showing of $5,502,241, which was the total for 1907, although it shows a very substantial increase over the 1906 figures of $3,497,016. This is illustrated by the returns for the month of June, 1908, as compared with the same period a year ago, during which $732,054 worth of parts and cars were shipped out of the country, whereas this year the total only reached $710,722. Doubtless this falling off can be traced directly to the period of lessened activity last fall, for, as shown by the detailed returns, such countries as the United Kingdom, France, Germany and Italy, all of which are automobile producers themselves, have taken constantly increasing quantities of American cars and parts, the gain in values sent to Great Britain during the past year being more than a quarter million, while to France it was $180,000 in round numbers. The total number of cars sent abroad during the past year was 2,477, making their average value $1,880, which marks a very substantial increase over those sent in earlier years.

THE BEST WAY TO CHECK SPEEDING.

Chief of Police Donovan, of Portchester, N. Y., now believes that gentlemanly methods are the most effective in dealing with automobilists. Instead of setting ambushes and traps, he stations his men on the different roads leading into Portchester with cards to hand to the occupants of passing machines, welcoming them to the city and requesting them to observe the speed laws while passing through. Chief Donovan says that the plan has now had a fair trial and has been productive of results far beyond his expectations, as there has not been a single violation of the speed laws since the cards were distributed.

AUTO PATROL WANTED IN ST. JOSEPH.

St. Joseph, Mo., Aug. 1.—Chief of Police Frans is strongly urging the powers that be in this city to purchase an automobile patrol for the police department. The rapidity with which the city is spreading out in the northern and eastern districts will soon necessitate building sub-stations there unless automobile service is provided. While the first cost of the auto would be heavy, Chief Frans thinks that it would soon pay for itself by the saving in horseflesh, as well as by the far greater rapidity with which cells from outlying districts can be answered.

LETTERS INTERESTING AND INSTRUCTIVE

ABOUT TESTING OUT THE SPARK COILS.

Editor THE AUTOMOBILE:

[1,493.]—Will you pleaee inform me tbrough your query department how to test out the epark coils? I have never seen this stated and would like to have some light shed on the subject.

Leominster, Mass. C. F. NIXON.

There are several ways in which the spark coils of any automobile can be "tested out," so we are somewhat at a loss to know exactly what you wish. The test most commonly required by the average autoist, however, is that for the consumption of battery current, and on this subject we have published fully a score of letters during the past year, with more or less lengthy answers thereto. Take a low-reading ammeter, *i.e.*, one that is calibrated up to 3 amperes by tenths of an ampere, and insert this in series with the coil to be tested. That is, connect one terminal of the instrument to the battery and the other to the primary terminal of the coil, so that all the current which passes through the coil to cause the spark must go through the instrument, commonly called a coil-current tester, or meter. This must be done with the motor running under its own power, as a test made under any other conditions would be valueless for practical purposes. The needle of the meter will move every time the current passes and then drop back again to zero, but as good instruments of this kind are of what is known as the dead beat type, in that the movement of the needle is resisted by a counteracting force, and does not fluctuate constantly about the point at which it should come to rest, it will not be found difficult to gauge the current consumption in spite of its constant jumping, due to the current being entirely cut off each time the motor fires. Screw the trembler adjustment of the coil up or down according to the reading given by the instrument, until the coil is consuming the minimum amount of current that the motor will run on without missing. This should not exceed 0.50 to 0.75 ampere. The manner in which battery current may be wasted unconsciously may be shown by screwing one of the trembler blades down hard, which will cause the needle to register two to three amperes. Repeat the operation in the manner above described in the case of each coil.

TROUBLE WITH A GOVERNED MOTOR.

Editor THE AUTOMOBILE:

[1,494.]—In your "Letters Interesting and Instructive" will you give me your diagnosis of this trouble? My 4-cylinder engine runs perfectly when the throttle is open. But on the governor, it skipe the two forward cylinders entirely. Theee receive their gas through the same section of manifold, and I have removed and replaced with every care the manifold many times, and cannot find that there is a leak on that side whatever.

As soon as the volume of gas is increased through the throttle, Nos. 1 and 2 pick up with the rest, but not until the throttle is well open.

This causes the use of too much gas and makes the engine hard to handle and have uniform power on any low speed. Could this trouble be caused by anything else than a leaky manifold on that side? The compression in both forward cylinders is fine and equal to that in the two back ones, and the timing of the valves supposedly the same. LOVER OF THE SPORT.

Albany, N. Y.

If your investigations have satisfied you that there is no question of anything being wrong with the manifold, we should suggest cutting out the governor and running the engine as slowly as it is possible to do so by closing the throttle by hand, meanwhile observing its action. If it will run slowly when governed by hand in this manner and have each cylinder fire regularly, you will be able to put down the trouble as caused by the governor itself. There may be some derangement of the throttle valve, by means of which the gas to the two forward cylinders is cut off entirely when the throttle is partially closed and no fuel reaches them until it is opened to a certain point.

INTERESTING QUERIES ABOUT LUBRICATION.

Editor THE AUTOMOBILE:

[1,495.]—I have an engine with the crankcase divided into three compartments or crankpits. Will you tell me how I can, ueing splasb lubrication, keep the oil at a constant level, supply being from a tank, without using a pump or otber similar device?

I have been told that I can use some such arrangement as is used in the student's safety lamp, but I have been unable to find out what this is. I will be very grateful for any belp you can give me.

In your issue of July 23 I see that the oiling systems on the Franklin and Studebaker cars went out of commission, and that they finished with a perfect score by using only the splash. If this is sufficient, why use the oilers at all? M. E. M.

Far Rockaway, N. Y.

Probably the best way to accomplish this would be to take three independent leads from the gravity tank, one to each of the three compartments of the crankcase, placing a gravity sight feed on each one of them in a place where it would be readily accessible for regulation. By experiment, ascertain the proper level to maintain the oil supply in each of the crankcase compartments. This can be done by putting in what is known to be an excessive supply, and gradually reducing it to a point where the motor shows no signs of smoke at the exhaust, but where the bearings are still getting an ample supply of oil; some motors, owing to poor design, cannot be properly lubricated short of smoking. Having ascertained just what the proper level should be, the next thing to find out is how much oil should be fed per minute to maintain this level while the motor is running. A good sight feed can be regulated to pass anything from two or three drops per minute up to a steady stream, but doubtless it will be found that a feed of from 12 to 15 drops per minute will be about what is required for the average motor that does not show any tendency to run dry. The best material to make such a tank of is copper, and the best location for it is right alongside the motor, at about the level of the cylinder heads. In this position the oil will be subjected to a practically constant temperature summer and winter, while the motor is running, and there will be the minimum necessity for altering the adjustment of the feeds. By placing the tank as above indicated and adhering constantly to the same grade of oil, there should be little occasion for making any change in the adjustment of the feeds. Otherwise the greater or less viscosity of different grades of oil and its varying density with the temperature would tend to alter the rate of feed every time conditions changed. An equally simple, and far more positive, method of lubrication consists of maintaining the level in the crankcase by means of a reservoir and a pump. The capacity of the latter is such that it just supplies sufficient oil to insure the proper quantity, the oil running from the tank into the crankcase by gravity, being lifted again to the tank or reservoir by the pump. By this method the same oil is constantly circulated, sight feeds being put in the pipes to show that it is running. Such a system starts and stops with the motor, and comes as near to fulfiling the requirements of being automatic and self-contained as any that we know of. There are no adjustments to watch, and it is only necessary to clean out the crankcase and renew the supply every 300 to 500 miles, according to the efficiency of the motor in this respect. This is something that should be done on every car, regardless of the type of lubricator employed, as the oil remaining in the crankcase after that distance is practically valueless and should be replaced by fresh lubricant.

The fact that the cars you mention managed to complete the day's run with their oilers out of commission is not proof conclusive that they could be run indefinitely without the force-feed oilers with which they are equipped. Practically

every car, regardless of the elaborateness of its oiling equipment, depends in greater or less measure on splash lubrication. The object of the oilers is to maintain the level of the oil in the crankcase and to insure the delivery of a supply of oil at points not ordinarily reached by the splash, or not covered as positively as the force-feed oiler can do it. The latter takes the place of the gravity feed arrangement described above, and force-feed types of oilers have supplanted gravity principally on account of their certainty and reliability. But there must be a certain amount of oil present in the crankcase before there is any splash, and in some cars this is quite a quantity, on which they are able to run for some time without renewing the supply. A description of a circulating system such as we mention was published in THE AUTOMOBILE of June 11, page 810.

A CHANCE FOR SOME PROGRESSIVE FIRMS.

Editor THE AUTOMOBILE:

[1,496.]—I have been very much interested in the articles on "Autogenous Welding" in "The Automobile" and can realize fully the great value of this process in making difficult repairs which any motorist is liable to be in need of, and hope you can give us more information in the way of "Cost of Autogenous Welding Equipment, Upkeep, Practice, and Skill" required to do good work, and, if possible, I hope you may induce a few firms doing this kind of welding to advertise regulary in "The Automobile," and thus enable any of us who may be in need to know at once where we can get such work done promptly and well. C. AVERY.

Pleasant Lake, Ind.

There are already two or three firms who are making a specialty of automobile repairs by means of this process and some of the work that they have accomplished is certainly eye-opening. In one case that was called to our attention recently a piece had been blown out of the interior of the combustion chamber of one of the cylinders of a four-cylinder motor. Under ordinary circumstances, there would have been no possible alternative but to scrap the twin-cylinder casting and supply a new one—rather an expensive repair. With the aid of a cutting burner, however, a piece was cut out of the jacket over the place where the injury had resulted to the combustion chamber of the cylinder. The piece that had been blown out was fished out of the jacket, cleaned up and welded back into place. The piece that had been cut out of the jacket to gain access to the repair was then welded back into place and the job was complete: time, considerably less than would have been required to dismantle the motor, remove the defective casting and replace it with a new one, as the work could be done without the necessity of taking the motor down. However, it is usually customary to remove such a part as a cylinder, as it is considered better to preheat such a large piece before welding it in order to avoid setting up internal strains in the metal, which might be the cause of trouble later.

Referring to your query as to information concerning the cost, equipment, upkeep, practice and skill required in autogenous welding, we will have to request the firms that are making and using the apparatus to come to our aid. It must also be borne in mind that the process is of comparatively recent origin and its advantages are not generally known. When they are, a great many breaks that now mean expensive replacements will be made good for very little and there will be few, if any, hopeless jobs. The suggestion that firms who are doing this work should make the fact known to the body of automobilists at large is one that, if followed, should result to the benefit of all concerned.

MISFORTUNES WITH A NEW RUNABOUT.

Editor THE AUTOMOBILE:

[1,497.]—I am an interested reader of "The Automobile," and especially of the Letters Interesting and Instructive department. I would like to have you advise through it regarding my Buick four-cylinder runabout, Model X. This car was purchased June 1, 1908, and has given me a great deal of trouble through faulty ignition. Two cylinders leak compression badly at all times, and I have had to have the valves ground three times in running 600 miles. I am using a good grade of lubricating oil—one that is recommended by the company, but the oil will work up and cover the spark plugs in 10 miles of travel. A few days ago I withdrew the oil from the crankcase and injected coal oil into each cylinder. I found that the coal oil leaked past the piston rings and into the crankcase in the cylinders, in which the compression was weak.

Do you think I could remedy this trouble by putting on new piston rings, or is it probable that after a few months' running the rings will expand enough to stop the loss of compression? If I put in new rings, will it be necessary to have them ground in the cylinder to make them fit? X. Y. Z.

New Salem, Ind.

There is apparently no cure for this loss of compression except the fitting of new rings, and if there is such a difference between the two pairs of cylinders, it might be found advisable to do this to all four cylinders while the engine is dismantled for the purpose, in order to make the compression in all four as nearly uniform as possible. Where a cylinder continues to leak in spite of the lubricating oil, new rings are about the only remedy, unless it is found on taking the engine down that the failure of the rings to act is not caused by any fault of the rings themselves but is due to carbon having got beneath them. If an examination shows this not to be the case, put in a new set of rings on each cylinder, and we should think that if the circumstances were explained to the maker of the car he would be glad to furnish such a replacement gratis, as an engine should never show such a defect after a few months' running. The mileage you state is hardly more than a good running-in trial; the engine should only have about found itself at the end of that time, instead of giving the trouble you complain of. It is not absolutely necessary to run the new rings in to the cylinder, but where this can be done it is preferable. After reassembling the engine, with the exception of the valves, flood the crankcase with oil and belt to some source of power, such as an electric motor or another automobile engine. Run at a comparatively slow speed for several hours and then finish assembling. If this cannot be done, assemble the engine for running, and have it turn over at a moderate speed without too much load, meanwhile using a liberal quantity of oil. In fact, it will be found advisable to use plenty of oil for the first few weeks, until the rings accommodate themselves to the cylinder. With good tight rings and the proper quantity of lubricating the trouble with the spark plugs should disappear.

IS THERE ANY BOOK OF CURRENT STYLES?

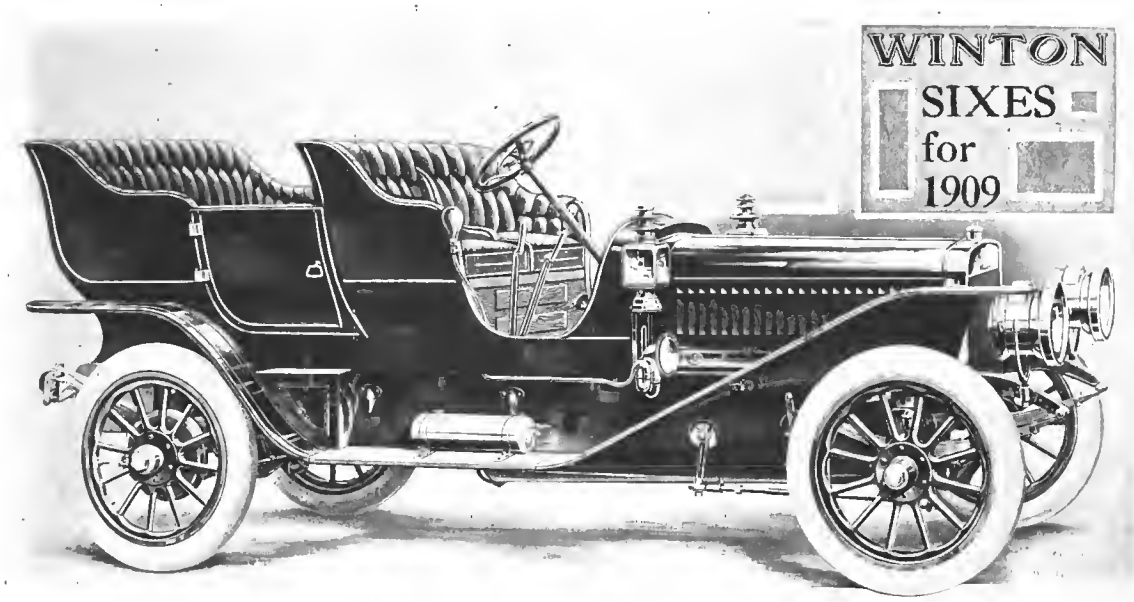
Editor THE AUTOMOBILE.

[1,498.]—I wrote you a letter a few days ago asking if you knew of any book that has been published recently and was advertised in "The Automobile," telling how to tell all the different automobiles from each other, which sold for fifty cents. Is there any machine made, either buggyabout or a standard model, using a two-cycle motor, friction drive and air cooled? GEORGE BRIGGS.

Bournedale, Mass.

So far as we know, no book of this kind has been published, at any price. The nearest thing to it would be the annual handbooks of the manufacturers' associations, the Association of Licensed Automobile Manufacturers and the American Motor Car Manufacturers' Association, both of which publish books illustrating and detailing the specifications of the current models of their makers. The address of the former is 7 East Forty-second street, and the latter, 29 West Forty-second street. We understand that both associations supply these books to prospective purchasers on request and free of any charge. Of course, there are a number of makers who are not members of either association.

The car that comes closest to your specifications, and the only one of the kind that we can call to mind at the moment, is the Duryea buggyaut. This has a two-cylinder, two-cycle, air-cooled motor and a type of friction drive that is novel. There may be other cars that fall more or less closely within your requirements as set forth, but we do not recall them, and probably some of our readers will come to our assistance, as it is getting pretty difficult to keep them all in mind, particularly as so many come on the scene only to disappear within a comparatively short time.

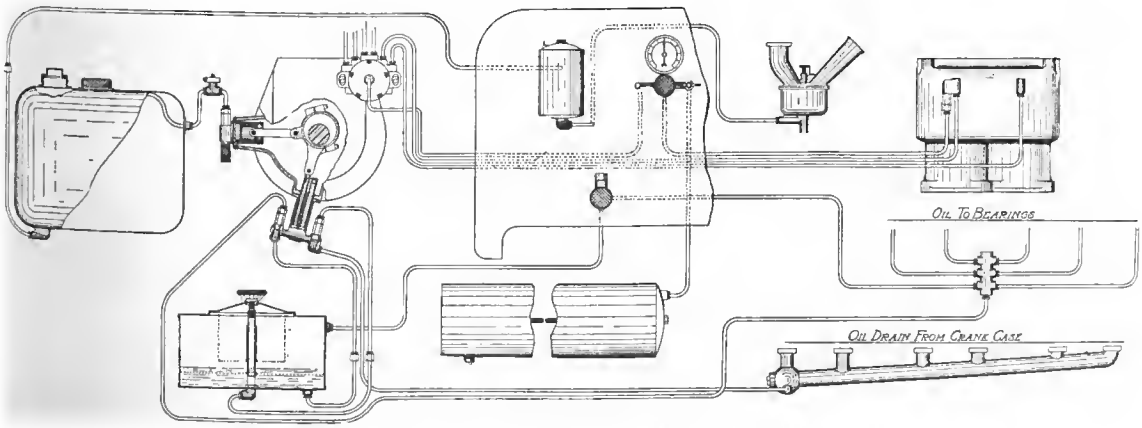


One of the Successors of the Winton Six-Teen-Six for 1908, to List at $3,000.

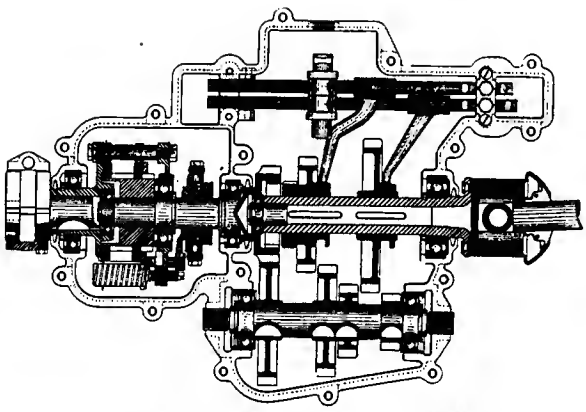
FOR the season of 1909, there will be two Winton six-cylinder cars in the field, in accordance with the previously outlined policy of the Winton Motor Carriage Company, Cleveland, O., to restrict its output to cars of that type exclusively. Both will be known as "Winton sixes," and their only practical difference will be that of size, the smaller, which is to list $3,000, being a 48.6-horsepower car, according to the A. L. A. M. rating, and is a continuation of the Winton Six-Teen-Six that was accorded such a favorable reception this year, while the larger is a seven-passenger, 60-horsepower car, which will be characterized throughout by practically the same features of design. One of its chief differences will be the use of a four-speed selective change-speed gear.

In both motors the cylinders are cast in pairs and are slightly offset from the center line of the crankhaft, in order to reduce the side thrust on the cylinder walls. The valves are all placed on the same side and operated from a common camshaft, the valves themselves being of the two-piece type of large size for the bore of the cylinder, and all are made interchangeable. The plan of enclosing the valve-operating mechanism in chambers on the side of the cylinders, and which are completely sealed by easily removable covers, met with instant success at the time the Winton Six-Teen-Six made its début, and has accordingly been followed on both models, so that with the single exception of the flywheel, there is not a working part of the motor that is exposed in any manner. The self-starting device has also been perpetuated as a part of the regular equipment of both the Winton motors for 1909. It is continued without any change and consists of a method of taking compressed air from the forward cylinder of the motor and storing it in a pressure tank. From the latter, it is distributed by means of a rotary valve to the different cylinders in the order of their firing. The motor can, in consequence, be started merely by depressing a foot button on the toe board, the air pressure running the motor as if it were a compressed air engine until it takes up its own cycle automatically, when the button is released and the air shut off. The starting device does not interfere in any way with the other functions of the motor, so that as soon as the latter moves under the impulse of the compressed air, charges are drawn in and fired and the motor runs under its own power. There is but one moving part, the rotary valve, so that the device as a whole is extremely simple and effective. In one of the appended diagrams, the connections of the self-starting device, as well as those of the gasoline and oil supply lines are shown clearly.

The tank at the extreme left is for the main supply of gaso-



Showing the Relative Positions of the Self-starter, Oil and Gasoline Lines.



Clutch and Gear-set of the Small Winton Six.

line, while immediately at the right is the air pump, operated by an eccentric, which also operates the two pumps for the lubricating oil feed. The oil tank is shown immediately below the oil pumps, while at the right hand of the air pump is shown the air distributor for the self starter. On the right of the oil tank appears the air pressure reservoir with a line leading to the foot button and pressure gauge on the dash. The small tank shown on the dash is the auxiliary gasoline tank, the carbureter being shown at the right, as well as two cylinders of the engine. From the first cylinder two pipes lead; one of these is to conduct the air pressure from the cylinder to the storage tank and the other is similar to the feed pipes leading to each of the six cylinders to distribute air to them from the pressure tank through the rotary valve. The oil leads to the bearings and the oil drain from the crankcase are shown at the lower right-hand side, illustrating the circulation of lubricant.

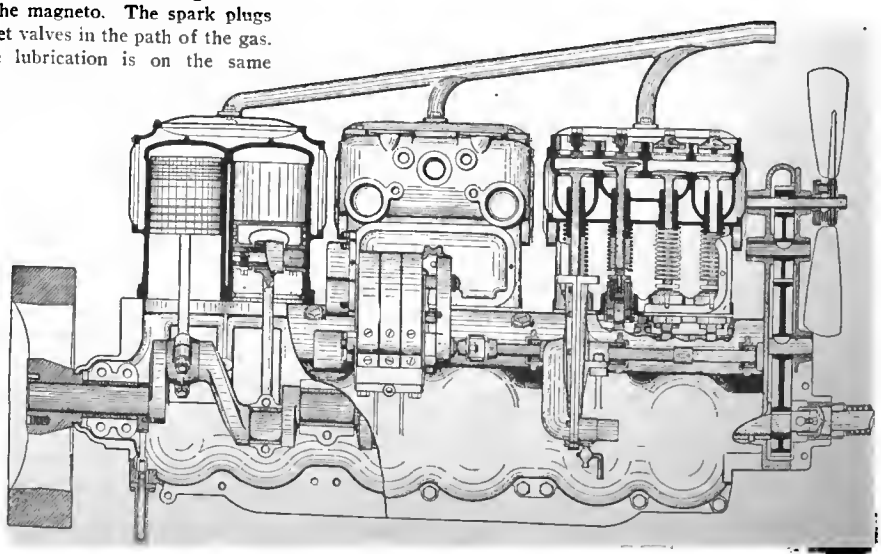
The carbureter is of the Winton type, having two nozzles and two throttles and operating progressively, the smaller opening first and the latter automatically picking up the larger one. The float chamber is placed concentric with the nozzle, thus maintaining a positive feed regardless of the grade. The carbureter is of the automatic compensating type, although it has no moving parts, and is placed on the side of the motor opposite the valves. A double system of ignition is employed, the Eisemann high-tension magneto being employed for the running side and constant service, while a set of accumulators is added to facilitate starting, their current being utilized through the single non-vibrating coil and distributor of the magneto. The spark plugs are placed horizontally over the inlet valves in the path of the gas.

On the 60-horsepower car the lubrication is on the same principle as on the Winton Six-Teen-Six, except that it has been considerably simplified by using but one pump, instead of twelve. The single pump is operated by an eccentric on the rear end of the crankshaft, taking oil from a tank at the left side of the motor and delivering it through the oil feeds to the crankshaft main bearings and forward gears. A second pump draws oil from the crankcase where it is deposited by gravity, and returns it to the oil tank above, where it is expelled to pass through a fine screen before being used again. There is a sight test on the dash to show the working of the system.

The cylinders are oiled by splash, while the clutch and gear-set run in an oil bath. A gear-driven centrifugal pump circulates the cooling water to and from the Winton type radiator.

A multiple disc clutch composed of 67 relatively small, steel friction surfaces constitutes the first step in the transmission of the power. Of these surfaces 33 are attached to the transmission shaft and 34 to the driving spiders, which are in turn connected with the flywheel, thus following the principle that the parts having the least inertia should be attached to the member having a variable velocity. Six springs placed at equal distances round the clutch distribute the pressure equally on all the discs, and they have been designed so as to be easily removable. The clutch and hand brake are interconnected and the clutch pedal cannot be locked out of engagement, except by the emergency brake. A selective sliding gear-set supported on annular ball bearings forms the next step in the transmission. The gears are of specially hardened alloy steel, and the set provides a direct drive on the third speed through an internal and external gear combination. By means of a safety device the gears may always be moved into neutral but cannot be shifted from one speed to another without disengaging the clutch.

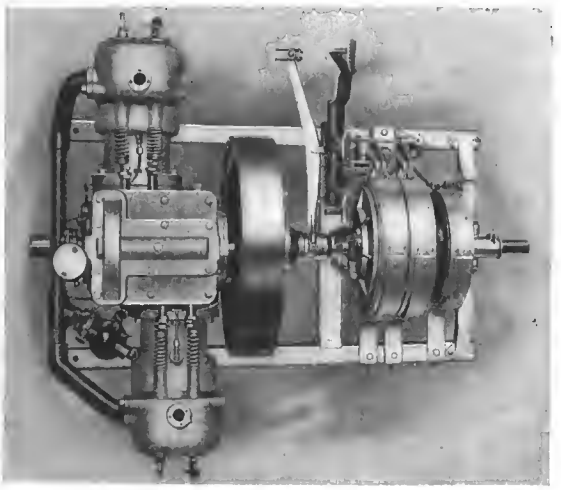
Final drive is by shaft with roller type universal couplings enclosed in grease-tight metallic cases. The flexible coupling between the motor and gear-set consists of a split housing engaging the square end of the main shaft of the gear-set, and a similar steel square bolted to the flywheel. Timken roller bearings are employed on the pinion shaft. The rear axle is of the floating car and carries no load, the weight of the car being supported entirely by the heavy drawn steel housing which surrounds the axle. A spur type of differential is employed and special Timken roller bearings are used throughout. The front axle is a one-piece I-beam casting of manganese bronze, as has been the case for several years, and this is also true of the Winton twin-spring suspension, shock absorbers having been added as a part of the regular equipment of the car. Brakes are of the usual internal expanding and external contracting types and are located in drums on the driving wheels, both sets acting through equalizers. A screw and nut steering mechanism with ball thrust bearings is employed, with a Lemoine type front steer, the steering links being adjustable, while the joints of all steering connections consist of a heavy bolt with a bushing, held secure by a nut and a large cotter pin. The wheels of the smaller car are 34-inch, while those of the 60-horsepower six-cylinder Winton are 36-inch, the wheels running on standard Timken roller bearings while the standard tire equipment in both cases consists of 4 1-2-inch Goodrich quick detachables.



Working Side of the 48.6-horsepower Motor of the Smaller Winton.

FEATURES OF THE GRABOWSKY TRUCK.

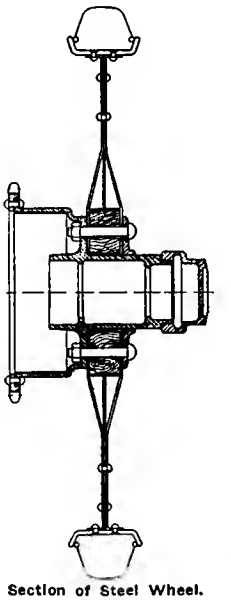
Several noteworthy features appear in the new trucks and commercial vehicles manufactured by the Grabowsky Power Wagon Company, of Detroit. They are the work of Max H. Grabowsky, formerly designer for the Rapid Motor Vehicle Company, now manager and designer for the company which bears his name. The company is at present turning out 1 and 1 1-2-ton chassis fitted with various types of bodies, for use as delivery wagons, passengers and sight-seeing cars, and for all kinds of municipal service, such as ambulances, patrol wagons, etc.



Plan View of Engine and Planetary Gear.

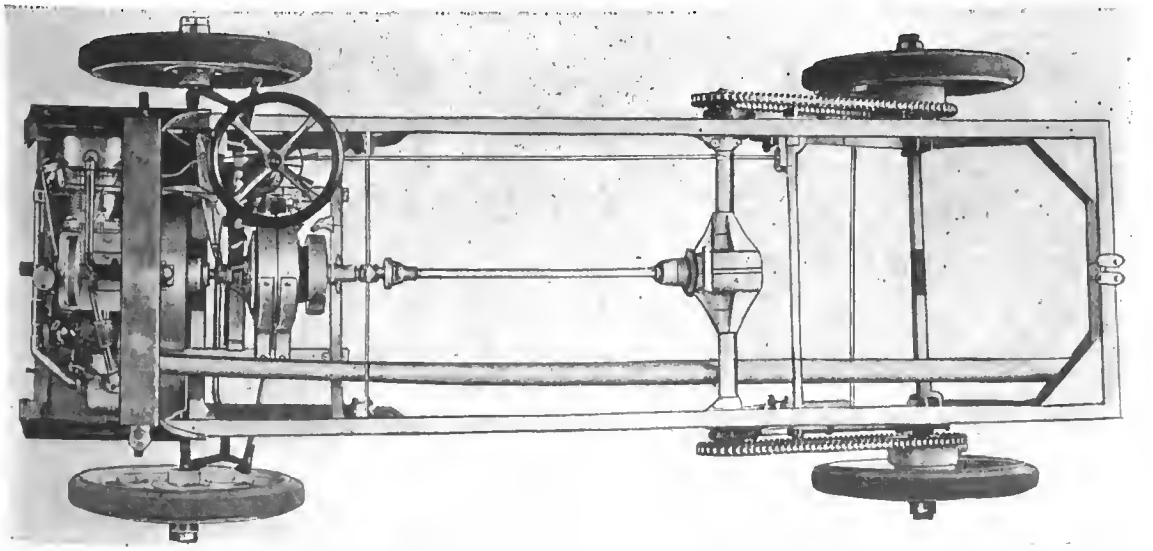
Perhaps the most striking innovation for such a comparatively light vehicle is the use of solid pressed steel wheels; these have many advantages for this service, being practically unbreakable, easy to keep clean, and at the same time cheaper than the ordinary wood-spoked wheels. The engine, of the two-cylinder horizontal opposed type, is placed at the front end of the car, and drives through bevel gears to a jack shaft, thence by chains to the rear wheels. The cylinders are 5 1-4 by 5 inches. The crankcase is cast of special grade iron, heavily ribbed. The crankshaft is a chrome-nickel steel drop-forging, 1 7-8 inches in diameter, with bearings of Parsons' white bronze. A standard ignition system is used, with storage batteries and coil in a special compartment under the front seat; the timer is carried on a vertical shaft in front of the engine, as shown by the photo; the lower end of this shaft drives the oil pump.

The engine is cooled by a thermo-syphon system which bears a strong resemblance to the steam-generating system used on several French cars about 1900. The radiator is constructed with a condensing tank four inches above the intake chamber; the water, returning from the engine in a steaming condition, rises through the tubes, collects in the condensing tank at the top, and then runs down to the main tank, from which it flows back to the cylinders. The position of the radiator, above and to the rear of the engine, allows easy access to the latter. When the hood is lifted the working parts are as ready to hand as if laid out on a workbench. A two-speed and reverse planetary gear is used, with friction bands of spring steel lined with a composition of asbestos and copper. The entire power plant and transmission is carried on a separate subframe, and by removing two bolts and breaking six quick detachable connections, can be lifted from the car intact. If such a thing should ever be necessary, it would be the work of but a few minutes to put in a complete new engine and gear.



Section of Steel Wheel.

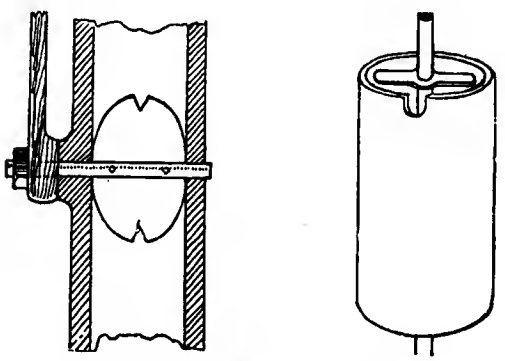
Both front and rear axles are constructed of the same material and dimensions, being of a special axle steel 1 1-2 x 2 3-4-inch section; the steering yokes have a six-inch spread. As stated above, the wheels are pressed steel, unless wooden wheels are specified by the purchaser, and are shod with solid endless side-wire tires. The frame is of extra-heavy channel section pressed steel, mounted on semi-elliptic springs in front and full platform springs in rear. The brake system consists of two internally expanding bands on the rear hubs, controlled by a pedal, and an emergency brake located on the drive shaft. There are no projections on the frame back of the steering column and controlling levers, so that the bodies may be easily slid on and off.



Plan View of Grabowsky Chassis, Showing Position of Radiator and General Layout.

PROPER ADJUSTMENT OF THE CAR'S ESSENTIALS

THE throttle valves in some carbureters are so designed and arranged that when they are almost closed a movement of the lever a single notch will stall or race the engine. This is bad enough if the steering column is perfectly stiff and the throttle movements are perfectly positive. If the steering column is springy the chances are the throttle movement is no longer positive, and one may stall or race the engine without shifting the lever at all, simply by pushing or pulling on the steering wheel



Curing Throttle Valve Trouble in an Old Car.

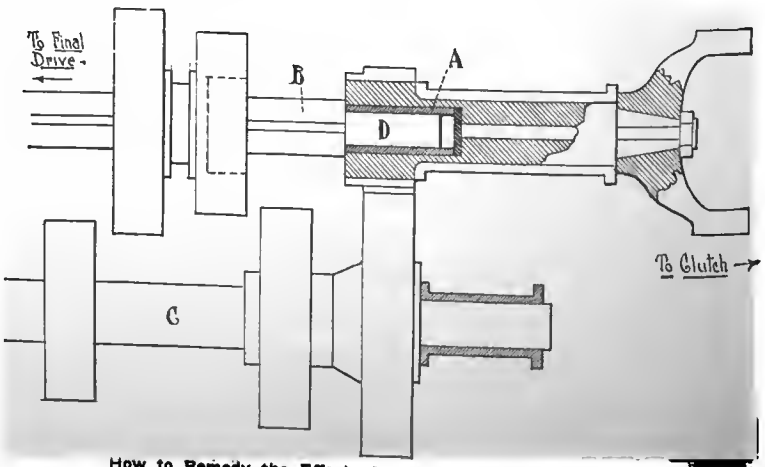
or by turning it in one direction or the other. When the throttle is well open the effect of this is imperceptible, but when the car is being maneuvered in limited quarters, as, for instance, on a garage floor, the fault is extremely annoying and may lead to accidents. The treatment will depend on the character of the throttle valve. If it is of the sliding or piston type, it is very easy to file a notch or slot in the edge of the valve, which will be opened by the first movement from tight shut, and will permit sufficient gas to pass to run the engine slowly with the clutch released. If this slot can be made fairly deep in proportion to its width the lever can be moved several notches without seriously affecting the speed of the engine. If the throttle valve is of the butterfly type the solution is not quite so easy. Fortunately, if this type of valve closes square across the pipe its first movement is fairly gradual. If the car owner has a carbureter with an elliptical butterfly throttle valve he will probably do best to take his choice between having the valve close tightly in its extreme position and having it close so that the motor will just run itself when idle. If he chooses the former alternative he will have difficulty in making his engine run quietly on a slight opening of the throttle. If, however, he chooses the second alternative, he can secure quiet running of the motor when idle by filing a notch in one edge of the valve as shown in the sketch and arranging his connection to the spark lever so that the slight amount of movement permitted by the spring of the steering column will not open the throttle.

Alignment of Loose Gearshaft Bearings.

Although in theory all gearshafts should be perfectly lined up, perfectly straight, and a perfect fit in their bearings, it must be admitted that in practice these three conditions are seldom fulfilled; and the practical question is, "What limits of error can be tolerated?" Obviously, a categorical answer cannot be given; so much depends on the width of the gears, length and stiffness of the shafts, length of the bearings and other variables. Gears with wide faces and small teeth require to be more accurately lined up than gears having narrow faces and large teeth. If either type of gear can be kept perfectly in line, so that its teeth have a bearing clear across their faces, it will wear much more slowly than if the teeth bear only across a portion of their faces. If the shafts are sprung, which may not impossibly be the case, the gears are much worse off than if the shafts are simply out of line, and the bearings also are worse off, since they will tend to wear oval, hour-glass shape, or otherwise, according to the particular kink in the shaft. When the drive is direct on third or fourth speed, usually the forward end of the squared shaft is reduced in diameter and enters a solid bushing A in the first spur pinion at the front end of the bear box. See the sketch.

Taking Up Movement in the Bearing.

When this bushing wears out, or when the shaft B springs and has to be straightened and trued by grinding, there is no way of taking up the bushing, and if it is several thousandths large for the shaft the natural tendency of the latter will be to slant away from the secondary shaft C as far as the bushing will permit, and thereby have a bearing in the bushing only at its front end until the bushing has worn conical at that end. Under these conditions, the shock of suddenly engaging the clutch might bend the squared shaft at D, where its front journal joins the square. To avoid this possibility the bearings of the first spur pinion may be scraped slightly sidewise toward the secondary shaft, to approximately half the amount of the difference in diameter between the bushing and the shaft entering it. This will enable the bushing to give a bearing to the journal clear up to the squared part of the shaft. Unless this expedient is resorted to it is not safe to tolerate a greater difference in diameter between the journal and the bushing than five to eight thousandths of an inch. It is obvious that the same device of scraping slightly to one side or the other may be resorted to in other places, to bring shafts in line or to compensate for small degrees of wear in the bearings. For example, the after bearing of the squared shaft could be scraped away from the secondary shaft under the circumstances above mentioned. If the car has side chain drive, the bevel gears may be brought square with each other by scraping the two cross bearings in the same way. Timely attention to defects such as those mentioned is usually all that determines whether a car can he said to be in good condition at the end of a year or two of service, or the reverse, for neglect of ills apparently trivial in themselves not only permits them to assume aggravated proportions, but also leads to others that are frequently of a far more serious nature.



How to Remedy the Effect of a Sprung or Disaligned Shaft.

PRESENT STATUS OF AMERICAN MOTOR VEHICLE LAWS

At the recent Buffalo Good Roads and Legislative Convention of the American Automobile Association, Chairman Charles Thaddeus Terry of the legislative board made a most comprehensive address, in which he made clear the present status of motor vehicle laws throughout the country. To the many who were unable to attend the convention his address will prove most interesting, and it is herewith reproduced:

Mr. President, Guests of the Association and Fellow-Members:—Our heartiest congratulations are due to the officers of the American Automobile Association, to its committees in charge of the convention, and to the individual members of the organization, upon the wisdom and foresight which conceived, and the intelligent industry and untiring zeel which have brought to so successful a consummation, the ideas embodied in this netional convention.

This is an epoch-making occasion. It is the most signal end significant event which has happened in the history of automobiling in this country. Its influence has alreedy been widely felt, and will be still more widely felt, to the lasting advantage of the industry and the sport in the daya to come. The deepest gratitude should be entertained by the user of motor vehicles in every State in this country to the American Automobile Association which has made such a convention as this possible and successful, and most of all is gretitude due, for his indomitable energy and unremitting labor, to that man who has spent his deys and nights, in season and out of season, for the upbuilding of this organization, in self-denying devotion to the interests of automobilists—our president, William H. Hotchkiss.

If this convention does not result in a vast improvement in the roads over which end the laws under which the automobilists may travel, it will be because the individual automobilista do not avail themselves of the magnificent opportunity which this occasion affords for stimulus, for knowledge of actuel conditions, for education, looking to the betterment of those conditiona and for an ecquisition of ideas which may be put into operation and worked out in concrete form in the several particular locailties where our individual members may happen to reside. The thoughts advanced snd the plans evolved at this assemblage muat be put into immediate operetion and application, else the value of this occasion will be utterly lost. A thought not converted into action is dead. It lies with you to see to it that the force set in motion on these two days shall be unending in its influence for good.

Good roeds and feir lews! But the more important of these is fair laws. Without fair laws, good roads ere of no use to the automobilist.

You might have throughout the country a system of roads surpassing anything yet devised by man, and, nevertheless, if stone walls were built ecross them every twenty-five miles, they would be useless as means of intercommunication. Barriers almost as effective es such stone walls have been erected at the confines end within the confines of various States throughout the Union by the enactment of laws which make an attempted use of the highways of the country so difficult and expensive ae to amount practicelly to a prohibition.

There are meny netural end inevitable obstructione to the automobile in the use of the highway. There are animals of every nature end description which wander about on the roada and make their passage dangerous, but, of all the creatures which infest the paths of travel the most obnoxious and the most unreasonable by fer, to the automobilist, is man, particularly when he is brought together in combination with other men in bodies called legislatures. How much has been done by lawmaking bodies to destroy the netural privileges of users of highways is realized by those who have attempted to use the motor car in interstate travel, but even to them the extent of the attempt, on the part of legislators, to erect this natural right to use the highways into an expensive privilege is not thoroughly understood, nor would it be generally believed, unless the detailed facts were presented to them in succinct form.

As a premise for the deliberations of this session, I present in brief outline the situation, as regards motor-vehicle legislation, ae it is at present.

Present Status of Motor Vehicle Laws.

The condition in which we find the motor vehicle laws of the various States of the nation at this time is both intolerable and ridiculous. Intolerable, beceuse it retards the progress and development of tbe automobile and greatly lessens its usefulneas. Ridiculous, because it is hard to conceive how, within the confines of one nation, so many legislative bodies, supposedly made up of the leading men of the commonwealtha, could enact provisions of law on the same subject so divergent and contradictory, and at the same time absolutely without apparent purpose, except to harass and restrict a certain class of citizens.

In thirty-one States of the nation, registration of motor vehicles is required, nearly every requirement being different from the other, the fees ranging from 25 cents to an annual fee of $25, and the authoritiee being in most instances the Secretary of State, and in some the State Boiler Inspector.

In aix States, local authorities may each require registration and licenaes in their particular locality.

In ten States, a license to operate, in addition to registration, is required, with annuel fees ranging from $1 to $3.

In eight States, the registration and license laws of the other States are entirely disregarded, and non-residents passing through are agaia required to register their vehicles, pass an examination aa to the competence to operate, and procure a license.

In four States, non-residents, exempt from the registration provisions of State laws, are not exempt from the registration end license requirements, enected by local authorities.

In seven States, non-residents are exempt for periods of time, ranging from twenty-four hours to sixty days.

The most striking illustration of the ridiculous and intolerable State enactments affecting non-resident automobilists ia to be found in the Eastern States.

An automobilist, desiring to go from New York to Waehington in a 30-horsepower vehicle, in eddition to registering and paying the fees in the State of his residence, must register his vehicle and procure a license to operate in the various States through which he must pess.

In the State of New Jersey, he must register his vehicle and pay a fee of $10, give to the Secretary of State power ef attorney to accept service of process for him, pass an examination, procure a license to operate, and pay an additional fee of $4.

In Pennsylvania he must again register his vehicle and pay a fee of $3, pass en examination, and procure a license to operate.

In Maryland, the same process must be repeated, with a fee of $3.

On arriving in the District of Columbia, he must register his name and address with the Automobile Board within 24 hours.

Such a state of affairs needs no characterization.

In matters of speed and rules of the roed, the automobilist is not only harassed by divergent and contradictory State laws, but in most States he is subject to restrictions imposed by local authoritiea of every political and governmental division of each particular State. The speed limitations range from four to twenty miles an hour, changing according to the locality, and the automobilist, without the slightest negligence or danger to other users of the highway, mey violate the speed laws six or eight times in a run of sixty miles.

The speeds allowed at intersections, crossings, bridges, and curves, range from four to six miles an hour; in cities and towns and built-up sections eight to ten miles an hour.

In seventeen States, as in New York, the maximum of speed allowed is twenty miles an hour, with limitations, ten miles in closely built-up sections of a city or village, fifteen miles in other portions thereof, and four miles on curves, bridges, and steep descents, varying in different States.

In six States, twenty-four miles an hour is the meximum.

In six States, fifteen miles an hour.

In one State, twelve miles an hour.

In one State, eighteen miles en hour.

In one State, eight miles an hour.

In one State, a reasonable and proper rate.

Only Two States Have Sane Laws.

There are only two States at the present time which have reasonable or sensible speed limitation provisions in their motor vehicle laws, and they are the States of Connecticut and Florida, which require that the rate of speed should be reasonable and proper, the effect of the Connecticut provision being partially destroyed by the maximum limitation of twenty-five miles. The other Statea have enactments which cannot be enforced or which make comfortable motor vehicle travel quite impossible.

It will be seen that if the motor vehicle is to take its proper place as a means of general travel and interstate communication, this intolerable condition must be changed and some basis of uniformity in legislation arrived at. An automobile is a power and force extending national development and automobilists should not suffer its usefulness to be restricted by laws enacted, not for the protection of the people of the State, but, as in New Jeraey, for the sole purpose of manufacturing an additional source of revenue. This condition will last only so long as the automobilists themselves acquiesce.

I have said that of all the creatures which infest the highways and make use of automobiles disagreeable or inconvenient or next

to impossible, men are the worst. Cows and horses and pigs and chickens are bad enough, but men are worse. A cow can only be slow and stupid—like a cow; a pig can only be a menace by making you think he is going to run into your way when he nevsr does—like a pig; a horss can only become needlessly frenzied with fear and break his harness and injurs everyone in his immediate neighborhood—just like a horse; a hen can only be the rattle-brained thing sbe is, and insist on showing how dangerous a motor vehicle is, by throwing herself in front of it and getting herself killed—like a hen; but, unhappily, men in some instances are all of these creatures together—sometimes they are in automobiles; sometimes they are walking or driving horses on ths highway; and—sometimes they are sitting in legislatures.

Provincialism Rampant in State Legislatures.

The present motor vehicle laws are ths last, best demonstration of the provincialism of several of our States. They are the masterpieces of men of so narrow an outlook that they cannot see that anyone lives behind the mountains which confine their hamlet, their county, or their own commonwealth. Those legislatures which ensct motor vehicle laws destructive of ths rights of the residents of other States to engage in interstate travel hide behind tbe high-sounding phrase, "States' rights," which, it will be observed, is utterly meaningless in this connection. Such laws spring not at all from an observation of States' rights, but entirely from a narrow provincialism which refuses to consider the rights of sister States.

And let us not be deceived by the cry of these legislators that the hostils automobils legislation which they enact is demanded by that much-abused class called "farmers." There is not a word of truth in it. No one who has given thought to the situation, has found the "farmer" anything but open-minded, reasonable, fair and ready to be instructed as to the facts and persuaded as to the natural conclusions to be drawn from tham. No, the trouble lies not with the farmers. It lies rather with the cheap politician, the demagogue, who is ever ready to make capital out of the nearest available matarial, and who, whether he asserts it in so many words or not, acts upon the assumption that he is the common people, the sovereign "who controls the roads, the deputies, and the future of political parties." Ha it is, and not tbe farmer, who instigates the enactment of these stupid, senseless laws. Of course, one does find from tima to time in every community, whether it is the city or the country, individuals who, because of some real or fancied indignity at the hands of an automobilist, arc ready to curss progress and sclence and everything and svarybody, and to rush to his senator and assemblyman and demand that the automobile be driven from the highways. But such incidents have become, in this day, not tha rule but the exception. Whatever may have been trus in former days, it is no longer true that bad automobile laws come by any popular demand. They are born of the imsginings of some one or more legislators, often for a political purpose.

Take, for example, New Jersey. Its automobile policy is as narrow as the geographical confines of the State itself compared with other States. It has the most unreasonable and unfair automobila law of any State in the Union, and it came, and exists, not bscause of any desire on the part of the people of the State, but as a necessary adjunct to the political aspirations of a single individual in the legisature.

Some Bad Laws Due to Misconception.

It is amazing how far behind the times many legislators have fallen. Their failure in msny instances to enact reasonable, sane, and effective automobile laws, has been due to a misconception of the present status of the motor car under modern conditions. Their error goes to the root of tha matter. They have utterly failed to observe that the automobile is no longer a mere instrument of sport, which may be carelessly treated as of no particular moment; which may be legislated off the highways if its use proves disagreeable to some narrow-mindsd peopla. They have not noted tha tremendous extent of its use, nor the varied purposes which it serves—in short, they have not opened their eyes to the fact that it has become an important factor in ths commerce of our country, and that in ten years it will becoma the most important vehicle of trads and transportation. It is no longer a mere luxury—it is a necessity. It performs all the functions of the horse and vastly more. In important respects, it will be superior to the railroad as a means of interstate communication and interstate trade, because, while the rsilroad is confined to the narrow limits of two stael rails and straight lines of travel and infrequent stopping places, the motor car reaches to the most remote corner, is confined to no particular line of travel, and can stop when its driver pleases.

As the advent of the railroad train absolved the traveler from dependence on the post chaiss and the stage coach, so the development of the motor vehicle will free him from the discomforts and inconveniences of the time-tabisd railroad.

It ia thus seen how unwise, how short-sighted, and how puerile it is for legislators to supposa that they may, at will, restrict and limit and needlessly embarrass the widespreading usa of this vehicle. It is irresistible progress against which they are pitting their puny strength. They are securing for themselves only ignominy and ultimate defeat, which is not now so far in the future.

The use of motor cars has only just begun. The science of their manufacture has not yet reached its maturity. The numbers of them in use will be multiplied year by year, until the horse will disappear—except as it is used for sport or pleasure—and be ss rare a sight upon our highways as the automobile ten years sgo.

Waks up, legislators! The automobils has gone by you while you were wondering when it would come. You cannot ignore it—neither can you deny it the rigbts which its importance demands.

Appeals to Prejudice No Longer Successful.

There was a time, not so many years ago, when the misdeeds and ths recklessness of the few among automobilists were made tbe basis for the hue and cry sgainst all of the clsss, a cry whicb found its echo in hostile, hateful, vengeful automobile legislstion in many States; but that time is past, and those statutes hsve for the most part been wiped off the statute books. Nowadays, snyone who attempted to make such an appeal to passion and prejudics would be calmly answered by the facts. Experience has shown that the great majority of automobilists are law-abiding, careful users of tbe highways, considerate of the rights of others, snd thst the real reason why there still exist a few who wlifully disregard the law and tbe decencies of the highway is, not because the highway laws were not right, but because the authorities were slothful in their enforcement of them. The remedy is not in other or different laws, but in ths enforcement of the plain, simple, common highway rules.

To enact laws which impair or destroy the rights of the many, in order to reach and punish the few, is distinctly un-American. It is directly contrary to the basic principle of our jurisprudence, which holds that it ia better that a thousand guilty persons should escape than that one innocent should suffer. Sucb States as the State of New Jersey have reversed tbis doctrine and havs framsd their law upon tha dogma that, better a thousand innocent persons shall suffer than that one guilty should escape. The bars statement of this policy carries its own aufficient condemnation.

Highways Are National.

For all purposes of interstate travel highways belong to the citizens of the United States, with the absolute right to travel thereon and to make ingress and egress from ths various States, unhampered by the narrow restrictions sought to be imposed by provincial enactment. The various and varying motor vehicls laws of the forty-five different States of the Union, oftentimes characterized by unreasonable, harsh, unnecessary and galling limitations, would, if they were persisted in, put an end to the uss of tlie automobile.

It would seem that, if we are really a nation, such a state of things would be impossible, as it is intolarable. The remedy lies in either one or both of two directions: Either, first, tbs enactment of a simple, uniform motor vehicle law in all of the States; or, second, the enactment of a Federal statute which will be controlling in all parts of the country. The remedy, will be administered; the reform, it la coming—indaed, it has, to a large extent, already come. Several of the States have at the last or previous sessions of their legislatures substantially enacted the uniform motor vehicle law proposed by this association. Look at the law of Connecticut, at the law of Rhoda Island, and at the law of Ohio.

The Federal Law.

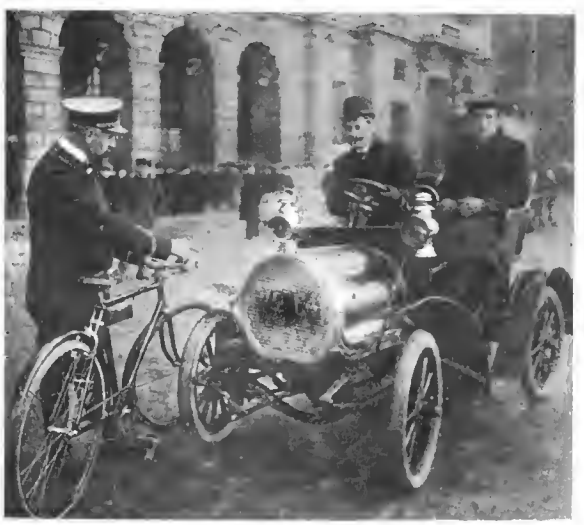
The Federal Automobile Registration bill, drafted and pressnted to Congress by this association, will become the law of the land. There is not the slightest question of it. It is recognized to be right and expedient by everybody, and no one, who has given the subject ndequate study, and whoss mind works clearly, denies the constitutionailty of the measure. If a man may walk or drivs, or sail in his steam yacht, through various States without being retarded and rastricted at the boundary line of each State by registration and license laws, why may he not likewise travel througb the various States in a motor vehicla? If it be said in answer that tho residents of the Stata require his identification for their own safety, the snswer is that the registration of tha motor vehicle under this Federal law will suffice, as it has always done in the case of steam and sailing vessels whila using the waterways of the nation. Under this bill, the only restriction upon the various States is that they shall not retard and impede motor vehicles engaged in interstate travel by useless and unnecessary registration and license requirements.

Gentlemen, the worst of tbe battls is over. The common sense of our people is again asserting itself, even to the confusion of some legislators wbo do not wish to be convinced. The Uniform State Motor Vehicla Law is on the way and at no vsry distant dats will be an accomplished fact. The Federal Automobile Registration Law, when it has been set upon the statute books, as it inevitably will be, will prove to automobilists tbe boon which it was intended to be, and will answer the criticisms of tbe last doubting obstructionist. In short, a better, brighter day is dawning in automobile legislation in all the world—and Naw Jersey.

TOURING AND PETTY PERSECUTION IN FRANCE

PARIS, July 30.—It is a period of contradictions in France just now, the country treating automobilists on the one hand with a generosity and largeness of view altogether without precedent, and on the other subjecting them to a series of petty annoyances always dangerous from their ability to develop into organized persecution. It is a sign of the times that the Minister of Public Works should take the initiative in calling an international conference to discuss new methods in road building and traffic control as the result of changed conditions of locomotion, and it is but further proof of the foresight of the same Minister that he should be prepared to spend thousands of dollars for the entire rebuilding of eight roads leading from the capital to all points of the provinces.

But there is a dark side to the picture in the mischievous activity of the police, especially in Paris, and the rampant "Protective Association Against the Excess in Automobiling." Automobilists always have been kept up to a high standard of conduct in the city of Paris, but as Chief of Police Lepine knew his business and took no delight in applying an arbitrary speed law, no one found fault with his regulations against smoky exhausts, the use of sirens and headlights within the city limits. Lately there has been a change for the worse, and instead of attention to the wise recommendation that safety or danger in speed depends not on a fixed rate of travel, but entirely on circumstances and places, there is a tendency in the suburbs to trap cars passing along certain well-traveled roads, whether transgressing legal limits or not.



Arresting Driver for Using a Number That Has Become Worn and Somewhat Weather-beaten.

There is also a nine-year-old regulation which declares that no driver shall leave his car until he has taken all precautions against accidental starting and until he has stopped all noise. All was well until some officious cycling policeman drew up a procès-verbal against the driver of a town vehicle for leaving his engine running while the car was unattended. Within two days half a dozen more were treated in the same manner and a cry of indignation went up. When it was asked in what way the gentle hum of a modern motor could be injurious, the righteously indignant were given a copy of the law to read.

Day in Prison May Be Penalty for Smoky Exhaust.

As a protection for drivers of automobiles, the Association Generale d'Automobile has decided to place a number of private agents on the streets at all important points, to give warning to all those who, intentionally or otherwise, are in danger of falling into the hands of the police. Should the registration numbers be dirty, exhaust smoking, rear light out or in danger of going out, or should the driver keep his headlights lit after passing the city wall, use his siren or show too much speed at dangerous points, the road agent will give him a kindly warning which should enable him to escape an annoying fine or a still more annoying day in prison. Under the new régime a driver of an automobile who has been fined once for any infringement of the law is condemned to twenty-four hours in prison for the second offense, even though it may be the harmless one of emitting too much smoke or driving without a rear light. The wise ones have learned that the only way to escape acquaintance with the inside of a cell is to shun the courthouse as they would the plague, when the first procès-verbal is served. They may be condemned to a fine, but a condemnation in the absence of the accused does not count in the scale which leads to the police cell. It is one of the intricacies of a legal scheme which a layman would not attempt to explain.

Far more dangerous than the petty prosecutions of overzealous police officials is the activity of the Protective Association Against Excess in Automobiling, founded by Colin, one of the best-hated men in France. Public lectures have been held in various parts of the country with a view to stirring up animosity against the automobile, Parliament has been assailed, and a bill proposed by which the automobilist should in every case be morally and financially responsible for every accident in which he may be involved. So active has been the association that leaders of the industry, including the president of the national club, have publicly taken up arms against the movement. Now every anti-auto meeting in the city is attended by an able speaker versed in questions of law, who "heckles" the lecturer when the time for public discussion arrives. One of the manufacturers' associations has entered into the fray by the publication of thousands of posters showing, by a series of pictures, how the poorly paid bicycle mechanic has risen to a comfortable position in life through the automobile industry, and how he will fall back to poverty if the anti-autoists are allowed to pass laws prejudicial to the spread of automobiling, with its numerous benefits.

Some provincial clubs are doing useful work by publishing every month, by means of posters and advertisements in the newspapers, statistics on the number of accidents caused by horses and automobiles. The Sarthe Club has a table which shows that in its department for a period of 76 days there were 50 accidents caused by horses, 9 deaths and 45 persons injured, compared with 3 accidents, no deaths and 3 wounded by automobiles. During the period preceding the Grand Prix, when automobile circulation was intense, there were no fatal accidents in the districts, while the average annual death roll in that district alone from horse accidents was 40 to 50. The figures being sent forth broadcast and backed up by undeniable proof, public opinion cannot but be favorably influenced.

Government Has Big Schemes for Perfecting Touring.

How the authorities are fostering the spread of automobiling is a pleasanter and more interesting story. The development of both commercial and pleasure automobiling will probably in the future be influenced as largely by road conditions as by the efforts of the manufacturers to produce mechanical masterpieces. Other things being equal, the country with the best road system will be the one to reap the greatest reward. At any rate, this was how Minister of Public Works Barthou looked at it when he decided to hold an international road conference this year. The first meeting of the organizing committee has been held in Paris, when the Minister announced that their ob-

ject was to adapt the present road system to new conditions of locomotion and save the highways from the destruction which was bound to follow if methods of an earlier age were applied to conditions of the twentieth century. They had done much in their own country to improve highways, but other nations had not been idle and it was imperative that they should get together and work out, from the fund of common knowledge, the systems which are best suited to new conditions of travel that now obtain so very generally.

Continental Europe is naturally primarily interested in the road conferences, for in addition to improved road surfaces and the suppression of the dust nuisance, they may by unison perfect plans for uniform road regulations and control, which will be of inestimable value as the highways rise to a position rivaling the railroad as arteries of communication. But America and other distant countries should obtain information from the experience of other countries which will be of inestimable value in the building up of her own road system and the remodeling of existing routes. It is especially important that the work of pioneers should be closely watched at a time when the supremacy of macadam appears likely to be lost for roads destined for mechanical traction.

Two Hundred Miles of Granite Paved Road Around Paris.

Discussions on what roads should be do not exhaust the activities of Minister Barthou. As a New Year's gift to automobilists he has promised the construction of eight main roads leading out of Paris to different points in the provinces, to be built on the most scientific plans and be absolutely dustless. As every tourist who has endeavored to enter or leave the French capital is aware, roads radiating from Paris are the worst in the country, the majority of them being built of rough, ill-laid paving stones and the minority consisting of badly-worn macadam. At present there is only one main road out of the capital which can really be regarded as good, the others being in a disgracefully poor condition. A chauffeur acquainted with all the highways and byways of the city reaches the open country by devious routes impossible to the stranger, who falls a victim to the forty-mile belt of pavé.

The eight automobile highways will be existing roads entirely remodeled. There is an excellent example of how this will be done in the Avenue de Neuilly, forming a continuation of the famous Avenue de la Grande Armée. Though laid perfectly straight and of excellent width throughout, automobilists shun this highway into Normandy, for its surface is a villainous pavé which would shake loose every nut on the car and make short work with springs. Consequently the highway which has seen the proud march of armies is now deserted by all but the wheezy steam street railroad and an occasional cyclist who picks out a track on the sidewalk.

When the old pavé has been pulled out, a cement bed will be laid and on this will be formed a surface of small granite blocks, considered after extensive experiments to be the best material for a highway intended for mechanical traction. A cheaper method of construction would have been cast composite blocks, formed of stone and cement, but experiments showed that it wore rapidly, generated dust and in consequence would give a muddy surface in wet weather. The granite will be obtained from Norwegian quarries, cut to required size by special machinery and shipped at a low price as ballast. It is believed that this will give a perfect surface, which, if horses could be removed from the highway, would be always free from dirt and naturally dustless and mudless. From the same Porte de Neuilly two other roads constructed on the same principles will start out for other parts of the provinces; in all there will be eight granite paved automobile roads giving egress from the walled city to points north, south, east and west. Among those coming in for improvement is the old cobblestone royal road from Paris to Versailles, passing through Billancourt and crossing the river at Sevres. This is at present abandoned to the light railroad and market carts, chauffeurs preferring the circuitous hilly road above Saint-Cloud to the jostling received in the valley. In addition to the radiating highways, there will be a granite-paved circular road varying from ten to twenty-five miles from the city limits, forming a belt around the town and intersecting every road. Thus a tourist arriving on some by-road between two of the paved highways will only have to travel along the circular road a few miles to meet a perfect track carrying him into town.

Credit for this interesting road making scheme lies about equally with the Touring Club of France and the Touring Commission of the Automobile Club of France, the heads of the two bodies working out the details of the scheme, making experiments in connection with road engineers and using all their influence with the Ministry. Since the scheme has been officially announced the A. C. F. has voted a subvention of $6,000 towards the work. In three years the scheme will have been fully completed and entrance to the Ville Lumière will be a pleasure instead of a purgatory. Experts will watch with interest the experiment of granite paving for a network of roads open to heavy traffic of all classes, as this is the first time that road construction of this kind has been planned for auto use.

SUIT INVOLVING DARRACQ DISSOLUTION.

PARIS, Aug. 1.—There are possibilities of a complete revolution in Franco-British relationships if a recent action brought against the Darracq firm meets with success. At the Tribunal of Commerce, this week, three of the most distinguished lawyers of France, acting for a group of persons whose names have not been made public, petitioned for the dissolution of the A. Darracq Company, Limited, on the grounds that the headquarters of the company were in London while the factory was in France. M. Poincaret, a former Minister of Finances, representing the Darracq Company, opposed the motion. Judgment was deferred.

Within the past few years a large number of prominent French automobile firms have been converted into British limited liability companies, on account of the better hold they would have on the British market and various administrative advantages.

Officers of the Darracq company, interviewed on the petition, declare emphatically that the whole affair is one of private jealousy, and maintain that there is nothing on the statute book preventing a French factory having its official headquarters in another country. The head of a rival firm, having large interests in England, is declared to be responsible for the proceedings.

FRENCH DRIVERS MUSTN'T RUN AWAY.

PARIS, Aug. 1.—To run away from the scene of an accident, or in any way to seek to evade the responsibility of an accident in which he may have been involved, will in future render the offender liable to from six days to two months in prison and a fine of 16 to 500 francs. The new law applies not merely to drivers of automobiles, but to those in charge of any kind of vehicle whatever, and is applicable to the whole of France. Its effect will be to make it impossible for any driver, whether he be in charge of a push cart or a racing automobile, to escape from an accident in which he has been involved and for which he may or may not be responsible. Rather than risk long and costly legal proceedings it has become too common for French automobile drivers, as well as drivers who do not sit behind a wheel, to pass on their way without stopping to inquire what damage they have caused. The new law, in no way changing the original statute on civil and penal responsibility, will naturally have the effect of checking irresponsible driving by rendering the practice of running away in order to escape the consequences of an accident of any nature, one not to be indulged in indiscriminately by chauffeurs.

CHICAGO NEXT WINTER WILL ONLY HAVE ONE AUTO SHOW

THERE will be only one automobile show in Chicago next winter. The show committees of the National Association of Automobile Manufacturers and the American Motor Car Manufacturers' Association Tuesday morning conferred in New York City and reached an understanding relative to the Chicago show situation. It will be remembered that the A. M. C. M. A. was not exactly satisfied with the previous manner of allotting spaces, and it was made known that unless its members received more consideration the association might conduct its own exhibition.

Tuesday morning the show committees of the two organizations held a session. The N. A. A. M. committee includes Thomas Henderson, Windsor T. White, George Pope, W. E. Metzger, C. C. Hildebrand and S. A. Miles, the general manager. The A. M. C. M. A. committee contains Benjamin Briscoe, H. O. Smith, R. M. Owen, S. H. Mora and Alfred Reeves, the general manager.

In accordance with the resolution adopted at the July meeting of the N. A. A. M. show committee a new method of space allotment was submitted, and this met with acceptance from the A. M. C. M. A. committee. Briefly stated, the spaces are divided into four classes, and the selection of positions is to be determined by lot. Providing there are more applicants for spaces than can be accommodated in any class, the executive committee of the N. A. A. M. will classify the applicants, and in so doing N. A. A. M. members will have first choice, and A. L. A. M. and A. M. C. M. A. members will be given second choice, though the committee will be guided further by the number of models produced by the applicants, the number of earlier shows at which the applicants have exhibited, and the size of the space occupied thereat. The arrangement practically means that N. A. A. M. members, whether licensed or unlicensed, will receive equal consideration in the allotting of exhibition spaces.

The regular monthly meeting of the N. A. A. M. executive committee, held in the afternoon, considered other matters, and granted sanctions for national shows, the A. M. C. M. A. exhibition at the Grand Central Palace being for the first week in January, and the A. L. A. M. show in Madison Square Garden being for the third week in January. A special committee appointed to consider and recommend a standard form of rim presented a detailed report, which was adopted, subject to satisfactory commercial details. The facilities of the transportation department of the N. A. A. M. will be extended to the A. M. C. M. A., in consideration of the agreement on the part of that body to cooperate in the work. Arrangements with the Motor and Accessory Manufacturers are still pending.

Present at the meeting were: S. T. Davis, Jr., W. T. White, Charles Clifton, Thomas Henderson, W. E. Metzger, Benjamin Briscoe, H. O. Smith, L. H. Kittridge, R. D. Chapin, W. Mitchell Lewis and S. A. Miles, and, as members of special committees, M. J. Budlong and G. W. Bennett.

POPE COMPANY TO REORGANIZE WITH $6,500,000 CAPITAL

HARTFORD, CONN., Aug. 3.—The long-predicted reorganization of the Pope interests that was formally announced for the first time late last week, is now under way. Briefly stated, the plan is to eliminate the common stock of the old corporation entirely, capitalize the company's indebtedness to a certain extent, and confine manufacturing to the Hartford and Westfield plants, the latter of which is devoted to bicycle making. Articles of incorporation may be asked for under the laws of New Jersey or in the company's home State, the projected capitalization being $6,500,000, of which $2,500,000 is to be preferred stock and the remainder common. A small coterie of New York capitalists was apparently responsible for bringing about the reorganization at this time, a committee appointed from their number consisting of Harry Brommer, of Hallgarten & Company; Frederick H. Ecker, treasurer of the Metropolitan Life, and August Heckscher.

Not including the amounts due to companies, the capital stock of which is owned by the Pope Company, the present indebtedness of the latter totals $1,640,000. There is now preferred stock of the face value of $2,391,000, and second preferred of the value of $8,625,100, outstanding, and the plan of reorganization is offered to the holders of such stock, based upon the deposit of their certificates with the Central Trust Company of New York. To actually begin business, notes to the amount of $800,000 will be issued in such amounts as the committee above named may deem necessary. These notes will be dated August 1, 1908, and will mature as follows: August 1, 1909, $267,000; August 1, 1910, $266,000, and a like amount one year later, the interest being at 6 per cent., payable semi-annually.

It is understood that the same personnel will be in control, namely, Albert L. Pope and Colonel George L. Pope, Wilbur C. Walker and Charles E. Walker.

PLANS FOR THE MAXWELL-BRISCOE AND BUICK COMBINE

NEGOTIATIONS for the consolidation of the Maxwell-Briscoe Company, of Tarrytown, N. Y., and the Buick Motor Company, of Jackson, Mich., which for some months have been more than merely whispered as being in progress, have reached now such an advanced stage that it is announced that the International Motor Company is in process of formation, with a capital of $25,000,000, made up of $11,000,000 common and $14,000,000 preferred stock.

Preferred stock to the amount of $900,000 is shortly to be put on the market at 97 1-2, with a share of common stock as a bonus, by the underwriters of the scheme, who are connected with J. P. Morgan & Co.

The attorneys engaged in the formation of the new company are Ward, Hayden & Satterlee. The junior partner is the son-in-law of J. P. Morgan. Another son-in-law of the noted financier, W. P. Hamilton, and W. P. Horn, a member of the staff of the banking house in question, are interested in the formation. So is Otto J. Merkle, of No. 40 Wall street, New York, who has back of him the Maxwell-Briscoe interests.

The holders of Maxwell-Briscoe preferred stock will receive two shares of preferred stock of the new company and one share of common stock for each share of the original preferred stock. At present $660,000 preferred stock out of $750,000 authorized is outstanding, and $660,000 common stock out of $750,00 authorized is also outstanding.

The prospectus issued estimates a possible production of 13,000 cars this year, including those already finished, and places the 1909 product conservatively at 15,000.

CLASSIFYING THE AUTOMOBILE BUYER.

Unconsciously, but none the less surely, the automobile buying public in this country has gradually been classifying itself, until now it may be said that the process has reached a point where three sharply defined divisions are discernible. Starting at the upper end, the first of these will naturally be found in that class of buyers who have made the 60 to 80-horsepower touring car a commercial possibility. This is the type of buyer whose needs can only be compassed by the seven-passenger touring car, and who invariably employs a driver. The class is a substantial one, and doubtless will always play a prominent part in the American demand, for, though the number of such cars may be relatively small, their value forms a very considerable proportion of the year's total when figured in dollars and cents. Next in order comes that very much larger class, the needs of which are met by the five-passenger touring car or roadster of half the horsepower, and which may, or may not, have a professional driver to look after it, according to the means or inclination of its owner. At the present writing, this is doubtless the most important class of the three, all things considered, the next step below it consisting of that legion of auto owners who go in for light runabouts and are always content to act as grooms to their own machines.

Judging from the announcements of those manufacturers who have already made their plans for 1909 public, it is quite apparent that the business of building automobiles has been classifying itself at the same time, and that not a few makers have decided to appeal to that very large and constantly growing class which we have designated as the second, or that intermediate the two extremes. It appears quite probable that this class is destined to predominate, as it is not only constantly being added to by the influx of new entrants, but also receives a very substantial addition in the shape of recruits from the class below it, as the light runabout is frequently but a stepping-stone to something more ambitious.

The period of transition through which both automobiles and automobile buyers have been passing, brings forth as a result a machine, the coming of which has been predicted for several years past. Why it did not appear on the scene earlier in the day is but one of the many puzzling queries that have surrounded things automobile ever since the inception of the latter. Evidently the time was not ripe, for many automobile builders were perfectly aware of the requirements and not a few possessed adequate facilities to have made what is now considered one of the greatest developments of the day a possibility two or three years ago. Very early in the day, when the superiority of the foreign-made machine was self-evident, the question was universal "Why do American manufacturers not give us what we want?" and their reluctance to part with exclusive and self-made standards of design at that time, evidently found its successor in the hesitancy which heretofore has characterized efforts to bring out medium weight and powered machines of the types that are now appearing.

* * *

SIMPLIFYING THE COOLING SYSTEM.

Simplicity may be taken as a synonym for the smallest number of parts, and, bearing this in mind, the two-cycle motor with thermo-siphon cooling may be held up as an ideal where the water-cooled engine is concerned. But as yet, the two-cycle principle has not been accorded that favor which its possibilities deserve, so that simplifying the motor in this respect resolves itself into a question of pump or no pump? That the pump can well be dispensed with is amply demonstrated by the great number of successful cars on which the water is circulated on the thermo-siphon principle, and there appears to be no good reason why this should not be more generally adopted, if, indeed, it does not come into practically universal favor. It has been shown that the extra quantity of water necessary is a negligible factor when the advantages of the system are taken into consideration.

The present trend of design is leaning more and more strongly toward the adoption of the thermo-siphon principle and the consequent elimination of the auxiliary that it renders unnecessary, as the practice of casting three and four-cylinder units in one piece permits of making a jacket in which the water may circulate much more freely than in the single or even the twin-cylinder casting. Another great advantage of combining the cylinders in a single unit in the case of a four-cylinder motor, or two units in the case of a six, is to be noted in the greatly simplified arrangement of the small amount of piping that is necessary, this being a benefit that extends to the elimination of the exhaust and inlet manifolds as well.

SIX-CYLINDER CHADWICK ENTERED IN VANDERBILT CUP RACE.

THE Vanderbilt Cup Commission has received from L. S. Chadwick the entry of a six-cylinder Chadwick car for the Vanderbilt Cup Race. All the experts at the Chadwick Engineering Works, Pottstown, Pa., have been turned loose on the racer and Mr. Chadwick expects to have it out on the new cement racing highway during the first week of October. This will give the driver, Willie Haupt, ample opportunity to learn the course before the elimination race, October 10.

The Chadwick racer will be a stock model in many respects, similar to those which have been so successful this year in hill climbs and other contests. It carries the standard six-cylinder motor, with cylinders 5 inches in bore by 6 inches stroke; the change gear gives four speeds forward, controlled selectively, and drives through side chains enclosed in special chain cases. Wheelbase is 112 inches, and the tires are 34x4-inch front and 36x4 1-2-inch rear. Equipped with a special racing body it will weigh 2,550 pounds. In cylinder bore and weight this car conforms to the so-called international rules of the Grand Prix, and its makers are anxious to see how it will compare with the winning Mercedes, driven by Lautenschlager in the Grand Prix, and which Robert Graves has bought and entered in the Vanderbilt.

Those who follow the racing game will remember that the Mora Motor Car Company, Newark, N. Y., has already entered a six-cylinder racer, and still another car of this type is expected to carry the colors of the Acme Motor Car Company. The latter does not intend to make the usual mistake of companies new to this work of finishing its car too late for any preliminary road work. The engine has already been assembled and tested in the factory at Reading, Pa., and found satisfactory, and it is expected that the complete car will be out on the roads of Berks county by August 15. Specifications include a six-cylinder engine of a bore slightly less than 5 inches and 5 inches stroke; the wheelbase will be rather shorter than the six-cylinder cars of this make already seen on the track, and in spite of the larger engine the weight has been decreased. Attention is being paid to quickness in picking up speed, as the makers believe that this quality will have an important effect on the success of the car in the race.

THAT INEFFECTIVE FOREIGN BOYCOTT AGAINST VANDERBILT

PARIS, July 30.—Since announcing an official boycott of the Vanderbilt Cup contest, the attitude of the leading members of the French Racing Board appears to be one of complete indifference regarding the quarrel between the American Automobile Association and the A. C. A. Instead of that righteous indignation which in certain quarters we are given to believe exists in the French Club against the action of the Vanderbilt Cup commission in announcing its race under independent rules, the Frenchmen declare, in substance, that they have put their protest on record and have no desire to be troubled further in the matter. The French Racing Board has enough troubles of its own on hand to prevent it having any very strong feelings on a quarrel between two automobile bodies several thousand miles away.

It is freely recognized in Paris that the boycott is more theoretical than practical. To put it in the vernacular, "it is for to laugh." Every manufacturer, though he voted the protest, is aware that if he desires to enter the Vanderbilt Cup race there is nothing whatever to prevent him. The fear that the French cars would be disadvantaged, which was doubtless felt by certain constructors a few months ago, is no longer a bogey. Instead of being slower than last year, the cars have proved, in a brutal manner, that they are not only faster, but too fast, the French failures being due to speeds that tires could not maintain.

Speaking to one of the leading officials of the Commission Sportive, the representative of THE AUTOMOBILE asked what steps would be taken if French firms sold their cars to be raced by private owners, or handed them over to their American agents to enter. Without hesitation, the reply came: "We could do nothing whatever in such a case." It is well known that negotiations are pending, and may be completed before this arrives, for the sale of the Mercedes victorious in the Grand Prix and for the transfer of the services of the winning driver to an American sportsman, who would enter them in the Vanderbilt race. Although Germany was one of the protesting parties, her officials can find no grounds whatever for objecting to such a course. The same is also true of those French firms who feel they would like to again compete for the cup won three times in succession. William K. Vanderbilt, Jr., is still in Paris.

METROPOLITAN TRADESMEN FORM RACING ASSOCIATION

AT a meeting held in New York, Friday, July 31, a local racing organization of tradesmen was formed, to be known as the Metropolitan Motor Association. Its charter membership is made up of three importers, three manufacturers and two local dealers who have been prominent in racing in the metropolitan district. The officers are: President, C. F. Wyckoff; vice-president, E. R. Hollander: treasurer, Harry S. Houpt.

Those who were present at the meeting and make up the charter membership follow: C. F. Wyckoff, of Wyckoff, Church & Partridge, Eastern sales agents of the Stearns; E. R. Hollander, Auto Import Co.; H. A. Lozier, Lozier Motor Co., maker of the Lozier; C. A. Singer, Palmer & Singer Mfg. Co., maker of the "P. & S." and selling agent of the Simplex; Paul La Croix, American representative of Renault Frères; C. M. Hamilton, Isotta Import Co.; Harry S. Houpt, New York agent of the Thomas; F. E. Moscovics, Allen-Kingston Co.

The objects of the association are stated to be:

First—To support only such contests held in and within 75 miles of New York City which have for their first object the stimulation and growth of public interest in automobile events which shall benefit the sport and industry as a whole

Second—To eliminate inexperienced drivers and officials.

Third—To regulate the number, length, and condition of contests.

Fourth—To safeguard the interests and safety of all contestants and the public by rigid supervision of courses.

In its official announcement the association declares that "the statement recently made in some of the New York papers, that this organization was to be formed to oppose the A. A. A. or A. C. A., is entirely erroneous, and is denied by the president of the association. It is hoped that some amicable arrangements can be arrived at whereby all interests, including clubs, associations and contestants, can get together on a proper basis without friction."

The association plans to promote a race meet at the Brighton Beach track on or about Labor Day. A program of at least six sprint contests is proposed, winding up with a 24-hour race. Fred J. Wagner has been secured as manager. A broadening of the membership of the association is contemplated.

CLUBS GROWING STRONGER AND MORE NUMEROUS

NEW JERSEY CLUBS CALL A CONVENTION.

NEWARK, N. J., Aug. 5.—New Jersey is to have a good roads legislative convention of its own. It is planned to hold it at Atlantic City early in September, probably 17-18. The co-operation of the farmers, as represented by the New Jersey State Grange, is to be asked. In view of the alliance completed at the Buffalo convention between the A. A. A. and the National Grange, the prospects of similar cooperation between the automobilists and farmers in New Jersey are bright.

The present unreasonable state motor vehicle law, which this year is keeping so many automobilists out of the state, to the great loss of hotel keepers and general business, will also come up for discussion, with a view to amendment along sane and just lines, at the next session of the legislature.

The decision to call the convention was made by the Associated Automobile Clubs of New Jersey at their meeting at Atlantic City last Saturday. It was further resolved to make every effort to organize autoists in localities where no clubs now exist, to

W. C. Crosby.
President Associated Automobile Clubs of New Jersey.

H. A. Bonnell.
Secretary Associated Automobile Clubs of New Jersey.

the end that the state body may be strengthened and carry with it the weight of larger numbers and present a more general representation of the counties of the state at the convention and before the legislature next winter.

There were several changes made in the official slate at the meeting that will give the New Jersey Automobile and Motor Club not only the largest motoring organization in the state, but also one of the largest in the country, the leadership in the administration of the state body. W. C. Crosby, vice-president of the club in question, was chosen president in place of George W. Post, of the North Jersey Automobile Club, of Paterson, resigned, and H. A. Bonnell, former secretary of the same club, a man of national reputation as an organizer and executive officer, was persuaded to get into harness again and assume the office of secretary-treasurer.

The following committees were appointed:

Legislation—W. C. Crosby, J. H. Edwards, J. H. Wood, A. H. Darnell, J. E. Gill.
Membership—Dr. F. C. Ard, J. E. Gill, H. A. Bonnell.
Good Roads—J. H. Edwards, J. H. Wood, Warren Somers.
Press—W. E. Edge, W. F. Sadler, Jr., A. G. Batchelder.
Touring—C. A. Post, K. G. Roebling, H. B. Cook.

It is probable that John W. Griggs, former governor of New Jersey, and more recently United States Attorney-General, will have charge of the suit that is to be brought next November to test the constitutionality of the Frelinghuysen law.

ATLANTIC CITY CLUB HELPS PRESERVE LAW.

ATLANTIC CITY, N. J., Aug. 3.—The feeling of soreness anent the "copping of a good thing" by the Atlantic City Automobile Club's yellow-flag contingent still exists among the energetic country constables and coin-hungry magistrates of Atlantic county. And the yellow-flaggers have not been arrested, either, as the authorities threatened when they made their first appearance last week. The A. C. A. C. officials point out to the county officials that the flaggers are merely to prevent infractions of the law; not to prevent arrests.

All week long each trap on every road leading into this city has been "tipped off" to the incoming autoists, and a more sedate set of drivers of long, low, rakish craft never ambled into the city by the sea. True, the scheme is costing the automobile club a little money; but as the bonifaces are helping some and the expressions of satisfaction from motor visitors over the condition of things are numerous, the club's officials feel amply repaid. The latter came out with the statement this week that they were quite as anxious to stop illegal speeding as were the county officials, and were prepared to arrest and prosecute offenders as well. In the face of such an announcement the county officials haven't a leg to stand on, and the yellow-flaggers will continue to work unmolested till the end of the season.

LOUISVILLE CLUB TO INVITE HOTCHKISS.

LOUISVILLE, KY., Aug. 3.—The July quarterly club meeting of the Louisville Automobile Club was held at Bruen's Garden, and proved a most enjoyable affair. Owing to the absence of the president and vice-president from the city, ex-President George H. Wilson was made chairman. It was decided to invite President Hotchkiss, of the American Automobile Association, to be the club's guest during the holding of the proposed race meet this fall, at which time the club is to give a banquet. Among other items of business transacted, committees on tire protection, racing and highways were appointed. The first consists of R. O. Bruer, George H. Laib and Benjamin B. Watts, while J. M. Chatterson, Ira S. Barnett, Dr. F. S. Clark, Walter I. Kohn and Hubert Levy will look after racing, and Hubert Levy, Dr. Leavell and Prince Wells will constitute the highway committee, the first member named being the chairman of his respective committee.

MORE SIGNBOARDS FOR SYRACUSE ROADS.

SYRACUSE, N. Y., Aug. 3.—Forman Wilkinson, the secretary of the Automobile Club of Syracuse, has placed an order for another 75 route and danger signs, and the work of "labelling" this section is proceeding with steadiness and dispatch. The next routes which the club intends to post are those leading from here to Sherburne, Rexford Falls and Richfield Springs. This is a big undertaking for the club single-handed, but the routes are so popular with automobilists that the officers have decided to do it.

Mr. Wilkinson points out to prospective members the advantages of having an organization to fight anti-automobile legislation. During the last session at Albany not less than 21 measures were introduced discriminating against automobiles, and that none of these found passage was due to the efforts of the New York State Automobile Association.

MARYLANDERS DISCOURAGE SPEEDING.

BALTIMORE, Aug. 3.—That the members of the Automobile Club of Maryland are sincere in their determination to discourage speeding in this city and State was demonstrated by their prompt action at the last meeting, when they passed a resolution condemning the race between an automobile and an airship,

which was one of the attractions at an amusement park. The automobile which called forth the action of the club belonged to Isidor Wolf, and was of 60 horsepower. The race was from the park in question to the City Hall and return. The members of the club say that such contests are injurious to automobilists in general and that they will try to have them stopped.

ACTIVITIES OF THE MINNEAPOLIS CLUB.

MINNEAPOLIS, MINN., Aug. 1.—The annual outing for the orphans of Minneapolis last Tuesday was the most successful event of the kind ever held here. Over 50 automobiles were provided, and the 200 children and 50 nurses were given a complete tour of the cities and parks of Minneapolis and St. Paul. After dinner and games at the Country Club there was a long drive to Minnehaha Falls and Fort Snelling.

The Minneapolis Automobile Club will decide this week whether or not it will go ahead with its plans for a floral parade during the week of the Minnesota State fair. The club members and the business men of the city are in favor of the parade, but the State fair officials have protested against it because it would draw the evening crowds away from the fair grounds. The relations between the two boards are rather strained at present on account of a deficit at last year's race meet, which the fair managers refused to make good.

FLORIDA AUTOMOBILISTS FORM A CLUB.

TAMPA, FLA., July 30.—A large number of auto enthusiasts of this city met one evening last week at the Board of Trade rooms and formed a temporary organization. T. E. Bryan was elected chairman and J. J. French secretary. While the club is to be known as the Tampa Automobile Club, its membership will not be restricted to residents of the city, but every owner of an automobile in Hillsborough county will be urged to join. Plans for a permanent organization were discussed, and a date set for another meeting, when it is hoped every auto owner in the vicinity will be present. The club's slogan is "Good Roads."

ECONOMY CONTEST AT HARRISBURG, PA.

HARRISBURG, PA., Aug. 1.—Many entries are expected in the economy contest which will be held by the Motor Club of Harrisburg on Saturday, August 15. The contest committee has not definitely decided on the course, but a hill may be included, in order to catch any cars which adjust their carbureters too finely to permit them to do any climbing on the high gear. One of the features of the contest will be a class for electrics. Valuable prizes will be given to the winners in each of the eight classes.

A. C. OF HARTFORD GROWING RAPIDLY.

HARTFORD, CONN., Aug. 1.—The membership of the Automobile Club of Hartford has now reached the 300 mark and more are on the waiting list. The annual hill-climb is the next event scheduled and the club expects to make it an even greater success than that of last year. Everett J. Lake, a prominent member of the club, has received the Republican nomination for governor. The Lake Club has been formed to support him, composed largely of his fellow-members of the Automobile Club. His election appears to be practically assured.

THE DEATH OF A FAMOUS FRENCH MAKER

PARIS, July 30.—A link with the past has been broken by the death of Louis Réné Panhard, one of the founders of the Panhard-Levassor Company, which took place at La Bourboule, where the deceased was undergoing a course of treatment. M. Panhard, who was in his sixty-seventh year, had been in failing health for some time, and although retaining a seat on the board of directors of his company took very little active part in the management. The last two years of his life had largely been spent at the small town of Thiais, of which M. Panhard was mayor.

It was in 1883 that the old-established firm of Perin, Panhard & Cie. became Panhard & Levassor, M. Perin having died and Levassor, up to that time one of the most important engineers, being elected as partner. The firm was then established in the Avenue d'Ivry, Paris, on the site of the present Panhard-Levassor factory, and was engaged in the manufacture of band saws and woodworking machinery. In 1889, M. Sarrasin, the holder of the French patents for the Daimler engine, requested the Panhard-Levassor firm to build him a motor according to plans which he supplied. Panhard agreed, the actual work being placed in the hands of his partner, Levassor. The same year Sarrasin died, his widow secured the patents, but, knowing nothing of mechanics, engaged Levassor as her engineer and took him with her to Germany to arrange the formalities attendant upon the dissolution of the German syndicate. On their return Madame Sarrasin was engaged to be married to Levassor, and it was in this way that the Daimler patents entered the Panhard-Levassor factory.

A small portion of the workshop was set aside for the construction of horseless carriages, eight men being employed on a quadricycle of one and three-quarter horsepower. After nearly three years' labor the little high-wheeled, ugly-looking buggy was able, towards the end of 1892, to run from the factory to the Pont du Jour and back, a total distance of about six miles, without a stop. It was the first success, and also the occasion of the sale of the first automobile the world had known, the buyer being M. Verlinde, a manufacturer at Lille.

Panhard and Levassor kissed one another; the former proposed to build a special factory; the latter replied "You are mad." The factory was built, it produced the car which won the world's first automobile race from Paris to Rouen in July, 1894; and a year later was victorious in the Paris-Bordeaux and return race with a 4-horsepower motor driven by Levassor. In 1896 the firm took part in the Paris-Marseilles-Paris race, during which Levassor overturned his car and received injuries which caused his death the following March, at a time when all ill-effects appeared to have been overcome. The firm was then converted into the Société des Anciens Etablissements Panhard et Levassor, with a capital of $1,000,000, which was subscribed by several members of the firm and their friends.

While continuing the manufacture of woodworking machinery, which is even now a branch of the firm's activities, the Avenue d'Ivry factories were considerably extended, and an era of success was entered upon which is without parallel in the history of the automobile industry. In the course of a few years the whole of the Avenue d'Ivry factory, comprising the ground, buildings and machinery, has been paid off, and is put down on the balance sheet at a franc. It is declared that if the manufacture of cars were stopped there is still a reserve fund to pay the shareholders a perpetual five per cent. dividend.

It is interesting to note that what is known as the Panhard car owed very little to Louis Réné Panhard, most of the early experimental work being done by his partner Levassor. Although Panhard was always a moving spirit in the conduct of the firm, he was not, even after the death of his partner, responsible for various mechanical improvements which kept the firm in a leading position for a number of years, and which have tended to give it a world-famed position.

The funeral ceremony of the late M. Panhard took place at the Madeleine Church, Paris, and was attended by practically all the French constructors, leading members of the Automobile Club of France and by a strong delegation from the factory. M. Panhard was an officer of the Legion d'Honneur and a chevalier of the Merite Agricole.

Miss Alice Potter and Party, of Elgin, Ill., in Their Haynes Car.

A WOMAN'S LONG-DISTANCE TOUR.

Miss Alice Potter, of Elgin, Ill., arrived in New York July 29 with her three friends, Mrs. Ada Dangerfield, Misses Elizabeth Forrest and Elizabeth Hunt, having completed the first half of her Elgin-New York-Elgin tour in just nine days. Miss Potter, who drives a 30-horsepower Haynes, had put some 15,000 miles to her credit before starting, all with a perfect score. She has never yet taken a mechanic with her on her tours, and personally superintends any work that is done upon her car. The party tours in leisurely fashion, enjoying the pleasures and sights along the way and stopping whenever and wherever the fancy takes them; all thoughts of records and averages are banished. As it is still quite unusual for ladies to take such a long tour in an automobile unaccompanied by any of the sterner sex for use in case of emergency, the different clubs took great interest in it. At Tarrytown they were met by Manager Heddington of the Haynes New York branch and escorted into the city.

PRESIDENT ROOSEVELT NOW VISITS IN AUTO.

The nation's chief executive has now come to realize the convenience and dispatch afforded by the power-driven vehicle, and is no longer loath to make use of an automobile whenever the opportunity affords. The photograph shows him in one of the government White Steamers on his recent visit to the encampment of Squadron C of the State Militia, at Huntington, L. I.

STODDARD-DAYTON AGENTS CONGREGATE.

DAYTON, O., Aug. 1.—This city has always been recognized as the home of sales and manufacturing organizations, and that perfect organization is the watchword of the Dayton Motor Car Co. was exemplified at the second annual convention of Stoddard-Dayton agents, July 29, 30 and 31. This meeting was attended by about 80 agents, who came from the Atlantic to the Pacific, and from Canada to Texas.

Wednesday was devoted to the inspection of the '09 models. These were on exhibition on the seventh floor of the new building, and embraced twenty-three types of bodies on four chassis, together with a display of all parts of the various motors, transmissions, axles in various stages of manufacture, from the rough steel to the finished product. A sectionized motor was used to show the complete lubricating system. This motor, which was electrically driven, had a glass covering over the cam gears and the same over the two rear cylinder openings on top of the crankcase, an electric light in the crankcase showing the absence of splash and the uniformity of the oil reaching the wrist pin and thence to the cylinder walls, as well as the constant lubrication of the cam gears. The chassis shows improvements in many details, including the strengthening of some parts and an increase in the wheelbase. The gear lever is now placed outside the frame on a special dust-proof quadrant, and an accelerator has been added to the throttle system.

The inspection of the models was concluded Wednesday evening by a Dutch supper at the Hofbrau.

Thursday was devoted to a thorough discussion of trade and selling conditions and the accessories equipment of the '09 cars. On Thursday evening, at a banquet in the Dayton Club, C. G. Stoddard acted as toastmaster, and the following toasts were proposed and responded to: "The Future of the Industry," by R. Y. Houk; "Observations of the Public," by J. M. Cox; and "As You See Them and as They Are," by F. A. Barder.

On Friday morning repairs, advertising and miscellaneous matters were talked over. At a picnic held on Friday afternoon at Wise's Camp the contests were all entered into with enthusiasm by the entire force of agents. The challenge cup was won by Mr. Sears.

Excitement was aroused Friday morning by the arrival of the two Hower trophy cars, Nos. 107 and 112. These cars, which were withdrawn from the contest at Pittsburg, were driven to Dayton in time to be inspected by the several agents, who made favorable comments on the first-class condition of the much-driven cars, which might well have been expected to show some sign of what they had gone through in the tour.

President Roosevelt in a White Steamer on His Visit to the Encampment of Squadron C of the State Mili

BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The Standard Horn Mfg. Co., of New York City, has been incorporated with a capital stock of $1,800, and will manufacture automobile horns, etc.

An automobile stage line is being operated by H. F. Mitchener and Company between Selma and Smithfield, Johnston county, N. C. One large car is in commission and makes the trip in twenty minutes.

The Renault Frères Selling Branch, Inc., of New York, has just been organized as a corporation with a capital of $100,000. The incorporators are F. Renault and C. Richardière, France, and Paul Lacroix, of New York.

W. H. Van Dervoort, president of the Moline Automobile Company, feels that his company was extremely unfortunate in having all its eggs in one basket in the recent Glidden Tour, and says that there will be a team of three Molines entered next year.

Figures compiled by an Akron, O., rubber manufacturer show that the output of the rubber factories of that city last year equaled $33,000,000, and about one-third of that was in rubber tires. The capital invested amounts to $23,000,000, and the annual outlay for labor is $9,000,000.

W. Smalley Daniels, manufacturers' agent, representing several lines of motor requisites, has removed his office from the T. Alton Bemis Company, 358 Atlantic avenue, Boston, to larger quarters in the Motor Mart, Room 22, Park Square, that city.

A story comes from Logansport, Ind., to the effect that the Western Motor Works of that city, makers of the Rutenber engines, has received an order for $100,000 worth of engines, with the clause that in event of the election of Bryan the buyer has the privilege of cancelling the order. Although no decision has yet been made, the order will probahly be dcclined.

J. V. Thomas, manager of the Weed Garage, Toledo, O., has gathered a lot of useful touring information in a little route book which he is sending out. Routes are carefully described and mapped between Toledo and Chicago, Buffalo, New York, Columbus, Cincinnati, Indianapolis and Detroit. The booklet conveys the compliments of the Weed Garage and the Boody House.

Ground has been broken for the factory of the newly-organized Velie Motor Vehicle Company, of Moline, Ill. Thc company will manufacture high-wheeled automobiles, designed to mect the growing demand for such vehicles among farmers. hut the usual made-over buggy design will he avoided. The new huilding will be 80x 200 feet, three stories in height, and will be constructed of reinforced concrete.

It is generally admitted that a manufacturer's demonstrating car receives pretty hard usage, and when, in addition to this, it is used as the general errand car from the factory, it gives the machine as sevcre a try-out as is conceivable. The Hess-Bright Mannfacturing Company, Philadelphia, Pa., have just received a set of their ball-bearings taken from a Knox car so used for over 50,000 miles. Only two hearings needed refilling with slightly larger balls, the others being as good as the day they were put in.

For the coming year, the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., has placed a contract for the complete lighting equipment of the 5,000 Maxwell cars of all types that will constitute its product for 1909 with one concern. This is the Rushmore Dynamo Works of Plainfield, N. J. The order will total close to $100,000 and is said to be the largest of its kind ever placed. In fact, it is not so long ago that thc average accessory manufacturer would have considered this a good figure for his entire year's business.

White Route Book, No. 7, just issued, makes a most important addition to the series of route books published by the White Company for distribution to tourists. As previous issues of the White Route Books contain road directions between New York and Buffalo, there are now available, for the first time, complete and accurate road directions between New York and Chicago. The new book also gives Harrisburg to Cleveland via Pittsburg, and is attractively illustrated.

The Rushmore Dynamo Works, Plainfield, N. J., announce that the appeal taken by the Manhattan Screw & Stamping Works from the decision rendered against them in the United States Circuit Court for the Southern District of New York, in which an injunction was granted the makers of the Rushmore lamps, has now been decided in their favor. This decision sustains the original order enjoining the defendants from making colorable imitations of the plaintiff's flare front design and appears definitely to settle the rights of the Rushmore company to this design.

This year's A. A. A. Reliability Tour was a harder test of automobile endurance than any that have preceded it, and the fact that 50 per cent. of the cars selected by the manufacturers for this grueling work were equipped with cork insert clutches and brakes, and that over fifty manufacturers are using cork inserts in their 1908 productions, are great testimonials of their value in automobile construction. Their use appears to bear out the claim of the makers, the National Brake and Clutch Company, 16 State street, Boston, that they are an element of insurance against clutch and brake troubles in new cars.

NEW AGENCIES ESTABLISHED.

The Brush agency in Washington, D. C., has been given to the Brush-Nichols Company, which has opened a garage and salesroom in the rear of the city post-office.

L. A. Perkins and C. C. Fletcher, of Rutland, Vt., have formed a partnership under the name of Perkins & Fletcher to handlc the Chalmers-Detroit in that city.

The Atlantic Motor Car Company, of 1776 Broadway, New York City, agents for the Stoddard-Dayton, will open a hranch in Newark next month. They are now erecting a large building at 2228-2230 Halsey street for that purpose.

W. L. Githens Brothers, of 1328 Michigan avenue, Chicago, have just been appointed agents in that city for the new E-M-F car, which is the product of the Everitt-Metzger-Flanders Company, of Detroit, and the preliminary description of which appeared in these columns recently.

Sidney A. Bean, general sales agent of the Autocoil Company, Jersey City, N. J., announces that a hranch office will be established in Detroit at 730 Woodward avenue. The new branch will be in charge of W. S. Austin, who has been connected with the engineering departments of the company for several years past.

PERSONAL TRADE MENTION.

J. B. Bartholomew, president of the Bartholomew Company, left Peoria, Ill., July 29, on a business trip through the East. Hc will stop in Detroit, Boston, New York, Philadelphia and Washington.

Stewart McDonald, vice-president of the Moon Motor Car Company, of St. Louis, is enjoying a six weeks' tour in his Moon car through New York State and Massachusetts.

Winton Sixes will now be handled in Buffalo by Ralph E. Brown, formerly of the Cleveland branch, who has succeeded O. L. Gooden. Mr. Brown is located on Main street, in the heart of auto row.

O. Y. Bartholomew, treasurer of the Bartholomew Company, Peoria, Ill., builders of the Glide cars, is to take charge of the firm's Eastern interests and will shortly establish his headquarters in Philadelphia.

The Perfection Spring Company, of Cleveland, O., announces that it has secured the services of E. F. Bunker, for many years connected with the automobile spring business, as manager for the territory east of Buffalo.

E. J. Moon, of the Moon Motor Car Company, of St. Louis, has returned from a two weeks' vacation tour through the resorts of Wisconsin and Minnesota, and reports the roads to be in very poor condition, generallv up to the hubs in mud. This was not as annoying as it might have been, however, as most of his time was spent in pursuit of the finny tribe.

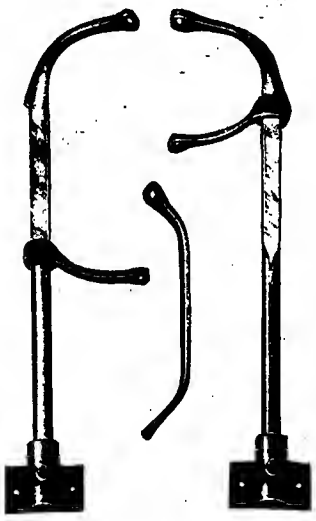
Harry Fosdick, of the Hol-Tan Company, 244 West Forty-ninth street, New York, has just returned from a three weeks' vacation and will immediately undertake the work of handling the new Lancia car imported by C. H. Tangeman. One of these cars is on view at the company's salesrooms in Forty-ninth street and examination shows it to have a numher of features which recommend it to discriminating buyers.

C. R. Hough has resigned as general manager of the Pope Automobile Company, of Washington, D. C., to accept a similar position with the Motor Car Company, agents in that city for the Peerless, Thomas, Stevens-Duryea, and Chalmers-Detroit. He succeeds W. C. Hood, who has been selected as sales manager of the Zell Motor Car Company of Baltimore. Elliott P. Hough succeeds his brother as manager of the Pope Automobile Company.

Joseph Grossman, for several years past treasurer and manager of the National Sales Corporation, has resigned from that position, and will embark in the special advertising field, with headquarters in Cleveland. Before assuming management of the National Sales Corporation Mr. Grossman was connected with the Continental Caoutchouc Company, and before that was a member of the firm of Emil Grossman & Bro., publishers of the *Motor Review*, which was purchased by the present owners of THE AUTOMOBILE.

INFORMATION FOR AUTO USERS

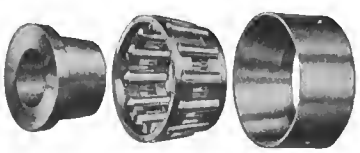
Adjustable Tire Bracket.—A new design of adjustable tire bracket has just been placed on the market by the Bi-Motor Equipment Company, 177 Portland street, Boston, which embodies several features



BI-MOTOR ADJUSTABLE TIRE BRACKETS.

that are entirely original. The attaching bracket takes up less room than is ordinarily the case with this class of fitting, and the brackets themselves are shorter and less bulky, thus making the attachment as a whole an ornament to the car, instead of giving it an awkward appearance. Being adjustable, these brackets can be used to hold one, two or three tires, and the construction is high quality, the straps being made of high-grade leather.

Grant Roller Bearing.—This was the first conical roller bearing to be placed on the market, being the prototype from which many others since introduced have been produced. It has been improved in a number of respects since it was first brought out, and is now being marketed by the Standard Roller Bearing Company, Philadelphia, Pa. The new bearing has solid rollers, with races and cones made of special steel, with the temper drawn, so that they are very tough and will not chip or break under the most severe service. The cone has an especially wide shoulder, against which the ends of the rollers have a bearing, practically to the center of the roll, the shoulder having the same degree of bevel as the ends of the rolls, the entire thrust being taken in this manner, thus giving great strength and durability. The cage, or retainer, holding the rolls, is made of the same general type as that used so successfully by this company for many years on its standard journal roller bearing. It consists of individual sockets or races, in which the ends of the rolls rest, and is made of solid steel with the two ends securely riveted together by means of a special electric riveter. The hot riveting makes the cage substantially one piece, and forms the strongest type of retainer that can be devised. It is impossible for it to twist out of shape, and as there are no small journals or pins on the rollers, the bearing is extremely strong and durable.



STANOARD GRANT ROLLER BEARING.

Albany Grease.—The name "Albany" on a lubricant means that the grease has the backing of many years' experience in its manufacture as the business of making Albany Grease was first undertaken in Albany, N. Y., forty years ago. The little establishment of the pioneer founder of the name, Adam Cook, was outgrown many years ago, and for the past seventeen years the products put out under this brand and which have achieved an enviable reputation the world round have been manufactured in the two large buildings located at 313 West street and 520 Washington street, New York City. The business is carried on by the sons of the originator of Albany grease, the firm being known as Adam Cook's Sons. Albany grease was the first lubricant of its kind to be used in the gear boxes of automobiles in this country, and it has since come into large demand for this purpose, while its use on the car has been extended to every location requiring a solid and reliable lubricant.

Circulation Pump.—New ideas in mechanics are not so frequently in evidence that we can afford to overlook them. In fact, an invention involving a new principle is very much of a novelty in the *au fait* mechanical world. The most recent device of that character to come under our notice is a surprisingly simple little circulation pump, a hasty glance at which would lead one to suppose it was a toy the purpose of which was not apparent by its design, but a critical examination by an expert will soon open his eyes to the fact that there is "something new under the sun." This circulation pump is certainly a wonder in the results it accomplishes; it is composed of an enclosed loose blade pivoted off its center, the pivot being set at the edge of a circular revolving disc. The model on demonstration at the show room of the manufacturer is fitted to standard 1-inch pipe, raises the water about 18 inches from the tap in the tank and discharges a full 1-inch stream when operated slowly by hand. When a 1-2 horsepower motor is attached the stream has such force as to give assurance that the rise would be much higher, if necessary, and the range of action very wide. The result is astonishing, and it is safe to predict that this circulation pump will take first place in the field, as it has high efficiency, is very simple, admits of the free passage of particles of wood, dirt, etc, cannot shut off the natural flow of water when not in operation; does not create a pressure of more than three pounds, therefore could not cause bursting or leaking of radiators or connections; and its cost is not its least attractive feature. The Circulating Pump Company, 1693 Broadway, New York, is marketing this article.

Lepaute Taximeter.—This taximeter is the one most generally used in all the principal cities of France and England, as well as the colonies. It is being introduced into this country by Ch. Dien, 45 West Thirty-fourth street, New York City, who is the general agent for the United States for this as well as a number of other imported specialties. A number are already in use on taxicabs in the metropolis and other American cities. It is manufactured by Henri Lepaute, Paris, an instrument making house established in 1740. The illustration shows the face of the taximeter with the instrument working on tariff one. When the flag is first turned down, an initial fare of 30 or 50 cents is at once registered, according to the rates of the company using the taximeter. During halts, the driver pushes the flag further down, and by so doing releases a clock movement, which registers a charge of 10 cents for every four minutes of waiting. In case of extras for trunks, additional passengers, crossing ferries and the like, the driver registers these himself by turning a knob on the back of the instrument. All the charges are totaled automatically by the instrument and appear through openings in the rear, so that a check may be kept on the driver, and it is impossible for the instrument to be tampered with or put out of action.

LEPAUTE TAXIMETER HANOLEO BY CH. DIEN.

THE AUTOMOBILE

Autoing in South America

By Sigmund Krausz.

THIS is written in Rio de Janeiro in the latter part of June of the present year. I left New York, May 1, on the steamship *Gunther*, with a view of introducing an American automobile in South America. I also made up my mind to study the automobile question from all points of view, but herein I shall confine myself to report only such observations as may be of interest to the readers of THE AUTOMOBILE and autoists in general.

In Bridgetown, on the island of Barbados, where a short stopover was not sufficient to go deeper into the matter, I had a chance to notice that the automobile has made its appearance even in the smaller islands of the Antilles. I even read in the Barbados *Advocate* of an automobile accident which had happened a few days before my arrival, and, in the same paper, I saw an advertisement of the single-cylinder Brush, claimed to be the best on the island.

Monroe Palace in Rio Janeiro

Autoing in Pernambuco

Street in Pernambuco

Avenue of Royal Palms, Pernambuco

Since it appears, from my information, that it has no competitors on the ground, there is no reason to doubt this assertion.

But in vain did I look about for auto tracks or gasoline and exhaust smells in Cabedello and Parahyba do Norte, the first ports of Brazil where I had a chance to spend some time ashore. Well, the first place is only a small village, but Parahyba has a population of 30,000. In spite of this fact, no jolly autoist has ever sounded his horn in Parahyba, and dogs and chickens are still living peacefully there and crossing the frightfully paved streets without danger to life and limb. Verily I believe that the appearance of an auto there would cause as much of a sensation as if the archangel Gabriel were to descend from heaven and blow the horn of resurrection. I doubt if very many Parahybanos are aware there is such a thing.

Avenida Central in Rio Janeiro

It was different in Pernambuco, my second landing place on the coast of Brazil. There are said to be 289,000 people living in this city, ten or twelve of which must surely have had more money than sense (I hope in the interest of the motor trade that none of these will ever read this copy of THE AUTOMOBILE), for I was told there were that many automobile owners in Pernambuco. How in the world any man, outside of a lunatic asylum, could get the idea to buy a car for use in this city is more than I can comprehend. I had a chance, through the courtesy of one of these gentlemen (again I hope he won't read this) to take a two hours' drive in a Clement-Bayard in the streets and environs of Pernambuco, and, if I live to-day to tell the tale, it is because my stomach and intestines refused to be shaken out of me. It was lucky that I had the idea of taking a snapshot of the car mentioned as it left the courtyard of my host, for after we started I was no longer in condition to think of anything but how best to resist the jolts and shocks I received during the course of that two hours' purgatory.

Similar conditions meet the autoist in Bahia, a city of 300,000 inhabitants, some 300 miles south of Pernambuco. There I met a man who knew a man who claimed to have seen an auto in town, but whether this is really so or whether the assertion is imaginary, I was unable to escertain. At any rate, the fact that I did not see a car in Bahia is proof positive to me that the people of this city are more endowed with gray matter or common sense than those of Pernambuco, for the pavements are certainly such as I have seen only in some of the worst streets of Constantinople. And what a delight it would otherwise be to motor in the winter months in and around Bahia amidst a luxuriant nature such as is rarely met with.

I had been told much and read much in magazine articles, consular reports, and other amusing literature about the great progress of South American republics, and especially that of the cities of Buenos Aires and Rio de Janeiro. Neither was I disappointed in the latter city, to which I proceeded from Bahia—by sea, as you may well imagone. There is not a mile of road in the country, outside the capital and Sao Paulo, that could be safely negotiated by an automobile, unless it be on a force tour to advertise a car, as was done lately by a French count, who made the trip between Rio de Janeiro and Sao Paulo, but with the resulting ruin of his car and an expenditure of several weeks' time. The distance, by the way, is less than 300 miles.

There are magnificent drives in Rio de Janeiro, of which I will speak a little later. For the moment, I want to dwell on my experiences in getting my Stoddard-Dayton out of the custom house and the necessary license for my demonstration to drive the car in Rio. I had met on the steamer the Austrian consul in this city, who gave me the cheerful information that it usually takes from two to three weeks, or even more, to clear a car from the "Alfandega," which is Portuguese for custom house, and it was not exactly with an easy heart that I looked forward to the red tape and annoying formalities of this procedure. But I have had business dealings with Latin-Americans before, and had, only lately, learned a lesson in Havana, the moral of which now proved useful to me.

I succeeded in clearing my car within 48 hours, but the hours of running, waiting, swearing, and talking in English, French, German, and with the help of an interpreter and native custom broker, in Portuguese, were agonizing. I wanted the car treated as a tourist's, or a sample car; *i.e.*, I only wished to deposit the amount of duty in the nature of a guarantee as a safeguard for me against the possibility of re-exportation, and although samples of other goods had previously been admitted on these conditions, mine was the first case of an automobile and had, therefore, no precedent. There were long consultations with various officials, and I was sent from Pontius to Pilate, but in the end I gained my object. Not, however, without using my influential letters of introduction to the Brazilian Secretary of State, Baron de Rio Branco, and the Secretary of the Navy, Admiral de Alencar. At that, I had to put in a written and stamped petition to the custom house authorities.

But it was only now that my real troubles started. I had the Stoddard-Dayton out of the "Alfandega," but was not allowed to run it on the streets. To make the thing short, I only state that for five days I wore the stone steps of the prefecture smooth in a chase from one official to the other, all of whom were politeness personified, but always showed me some clause in an ordinance or law which forbade just the thing I wanted them to do.

At last I got my precious document and four or five documents which entitled me now to chase through the streets of the Brazilian capital with my auto. For one does not drive rationally here, one chases at a go-as-you-please speed, even in the busiest districts. The cost of these documents figure up as follows:

65 milreis ($21.66) for an automobile license.
65 " (21.66) for examination of automobile.
23 " (11.00) for examination of chauffeur.
20 " (6.66) for chauffeur's license.

The examination of the car consisted of an official looking down from a second story window on the automobile, which stood in the street; that of the chauffeur in making a tour around the square in front of the municipal building. Then I got my number, 872. In regard to numbers in Rio de Janeiro the stranger is easily deceived if he judges the quantity of automobiles by them. The numbers run considerably over 1,000, although there are in all only about 300 cars in the city. This is explained by the fact that the city is divided into districts, numbered from one upwards, and the first, or first and second figure of the number carried on the car denotes simply the district in which the machine is registered. Thus my number 872 meant that the owner lived in the eighth district and possessed the seventy-second car registered therein.

My newspaper connections in the United States and a letter of introduction which I carried from the Press Club of Chicago got me next to the newspapers and eight of them gave me and my car most flattering notices of welcome in Brazil, and several of them used the opportunity to write at length on the abuses I had been put to at the prefecture. They also started a campaign for the abolition of the antiquated red tape and the introduction of a system, formed after the French pattern, in regard to tourist cars and samples imported for transitory use. Much amusement was caused in the city by the clever way in which an illustrated comic weekly, in a whole colored page, brought the matter to public attention, under the title of "Adventures of a Distinguished American Guest." The automobile club, too, took a hand in the affair, and thus I am quite proud of having given the initiative to a much-needed reform.

The cars owned at present in Rio by private owners and livery garages are principally of French origin, with a sprinkling of English, German, Italian, and American cars. The styles of cars vary, but the limousine and large touring body prevail, and some fine specimens may be seen during the semi-weekly *coros* along the bay, when gaily dressed women and children fill the vehicles which are driven up and down the Avenida Beira Mar between 5 and 6 P. M., Wednesdays and Saturdays.

Of livery cars, there used to be quite a large number on the streets, but lately they have diminished considerably, on account of a police ordinance which restricted their charge, and, at present only old and somewhat dilapidated vehicles stand for hire on the street. The price per hour was formerly 15 milreis (3 milreis equal $1) for the first and 10 milreis for subsequent hours for two persons; additional passengers, 1 milreis per person and hour. The charges now are 8 and 4 milreis, respectively, and the livery car owners claim not to be able to make a profit at these prices with decent cars in service. They rent now from their garages at the old prices and wait for a change in the police government and a return to the old rates. With that a renewed boom in the auto business is also expected. Among the livery cars on the streets I cannot omit to specially mention a curious and ridiculous looking little German runabout, called Piccolo; air-cooled, with two diagonally placed little 6-horsepower cylinders, all exposed, and room for only one person aside from the driver. About a dozen of these are in use, but not much in favor.

Motoring is practically confined to the city limits, and only the newly constructed avenues and streets afford pleasure. But these are really fine, and the splendid asphalt pavement of the Avenida Central, Uruguyana, Rua Florian Peixotto, and other thoroughfares, as well as the fine macadam of the Avenida Beira Mar, are unsurpassed motor roads of which any European city might be proud. And as to scenery along the latter road, I have, during my travels in many foreign lands, not seen anything to approach it. This magnicent avenue has been constructed within the last three or four years, as have been most modern improvements in Rio de Janeiro, and is, as yet, not quite finished, but the work is rapidly progressing, and within a short time the city will have, perhaps, the finest motor driveway in the world.

Altogether, motoring in Rio, in a climate where the winter corresponds to our June in the Middle States, might be an unalloyed pleasure were it not for the unaccountable habit of

the natives to prefer the middle of the road to walking on the broad sidewalks, and to walk at that, like some automobilists, neither looking to the right nor left and without paying attention to horn signals. Only the rattling clamor of the exhaust will cause them to pay attention and jump aside immediately in front of the car with a curse at the driver. That persons are not killed and mutilated every day in the streets of Rio, is really a wonder and speaks well either for the skill or the carefulness of the chauffeurs, who must be constantly on the lookout.

Another thing which mars the pleasure of the autoing tourist, and of native autoists, too, for that matter, is the fact that the price of gasoline is almost prohibitive. A case containing two cans of less than 5 gallons each costs from 16 to 22 milreis, according to where and in what quantity you buy it. This is a severe drawback to the pleasure, and has, together with the corresponding costliness of repairs, spare parts, accessories, and other supplies, tended to retard the development of motoring and to cause many devotees to again drop the sport after having followed it for a time. The present financial crisis here is also a reason why, for the present, there is a perfect stagnation in trade and sport, and it looks as if there would be no improvement until times get better.

If I have said before that the Avenido Beira Mar offers scenically unsurpassed beauties, I want to modify this statement. I had, for the moment, forgotten, that Rio de Janeiro has in its immediate environs, in the mountains which surround the city on all sides, a driveway the like of which no other capital can boast. Within 10 minutes from the center of the city a narrow but good road winds up Tynca Mountain in hairpin curves and spirals, leading along steep precipices, past cascades and magnificent lookouts, and always at a grade which often reaches 16 to 18 per cent. This road runs for several miles up the Tynca, thence to the Gavia mountain and down again to the other end of the city, through virgin forest dotted only here and there with a little hut or house on the lower altitudes. Its quiet and coolness make it a favorite excursion for autoists, in spite of its dangers, to which a one-track electric tramway, taking half the width of the driveway, adds considerably. My Stoddard-Dayton performed, however, on the Tynca, a trick which very few cars here have so far accomplished. It went up as far as White's Hotel on high speed with four passengers in it.

To reach Petropolis, the summer residence of many Rio citizens and the steady abode of the diplomatic corps accredited to Brazil, is, at present, impossible, although that city is within easy motoring distance. Only one man has so far driven there under incredible difficulties, and that, like the tour to Sao Paulo, to advertise a certain French car.

I venture to say that should an auto road to Petropolis be built, as the government is said to plan, the number of automobilists in Rio de Janeiro would be doubled in no time. I have been told by the amiable president of the Club Automobil Brasileiro, Count de Almeida, an enthusiastic autoist, that the project stands a good chance of realization.

In conclusion I must say a few words of this automobile club which is the only one in Brazil. It has about 200 members, belonging to the best class, and is a well-appointed place for social purposes. Its building contains no garage, however, and serves more as a rendezvous of the motorists who come there for refreshments and a game of tennis. There is plenty of European automobile literature to be found, but of American trade papers I have seen only THE AUTOMOBILE represented.

WHAT THE R. A. C. DUST TRIALS DEMONSTRATED

LONDON, Aug. 7.—The Royal Automobile Club has concluded its dust trials, and their results and the lessons that are to be learned from them are being anxiously awaited. The trials consisted of careful experiments with numerous devices for the investigation of the dust nuisance, and occupied two days at Brooklands racing track, the first day being devoted to the adjudication of the least dust-raising manufacturers' stock cars, for which event there were 25 entries. The second day experimental contrivances were dealt with.

Steam cars, owing to the remarkable lack of dust-raising properties demonstrated by the White and Stanley cars in last year's trials, were barred from the competition proper, and ran *hors concours*. Nearly all the ocular results went to show that, with or without special devices, the dust raised at 30 miles per hour is practically double that raised at 20 miles per hour. Of the various devices, the following are interesting, as showing the various ways in which inventors have set about the dust problem. That of H. Treadwell consists of a patent exhaust suction device. Pipes fitted with four rubber bell-mouthed pieces were fitted to an injector valved off the engine exhaust. Each of these bell-mouthed pieces were carried close to the ground directly behind each wheel. By the action of the injector the dust is sucked through the pipes into a central box, from which it is deposited from time to time in small heaps on the ground Another design was a complete undershield fitted to a Brooke car and invented by Conrad Ingleby. The shield was solid from the front axle up to halfway under the engine, after which point it was perforated for the rest of its length. At the back of the car and just over the shield were two fans, driven from the propeller shaft, and designed to fill the partial vacuum which the passage of the car always seems to create.

Better than this, or certainly its equal, was the performance of the standard 10-horsepower Cadillac, with patent folding seat. This had no other special devices upon it whatever, and its performance was a remarkable one in every way. A 20-horsepower Decauville fitted with Drury-Medhurst tires raised only a small amount of dust. These tires have an additional rim fitted in such a way that the tires only expand longitudinally, not laterally at all, and thus have a constant and narrow tread. A 40-horsepower Napier was fitted with various tires and ran with them time after time over the course. Only the photographs will be able to show the difference in their performances. To the naked eye they were all alike.

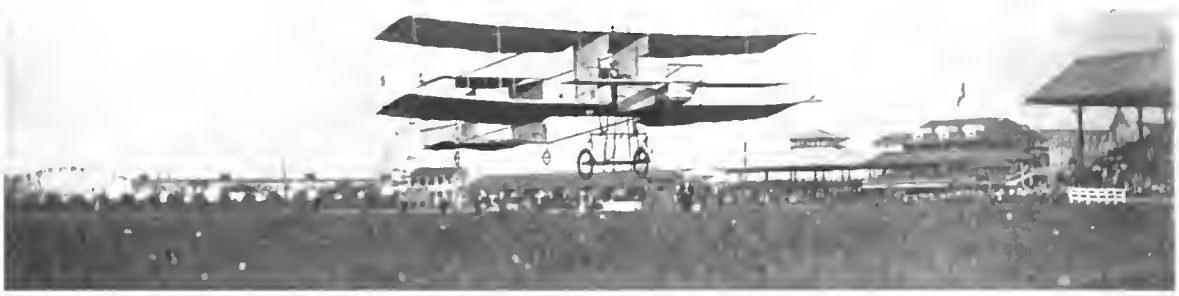
Whatever other lessons have been learned from the trials, the fact that steam cars are better than petrol ones, as far as dust is concerned, has been amply demonstrated. Throughout these trials a couple of steamers ran at frequent intervals and their performances were certainly worthy of notice. Taken on the whole, however, that of the standard Cadillac car is the most noteworthy of the whole trials, and signifies that in one respect at any rate America is ahead of England in automobile design.

SOUTHERNERS MAKE LONG TOURS.

LYNCHBURG, VA., Aug. 9.—Dr. George M. Preston, with his nieces, Misses Charlotte Clark and Jennie Strother, left recently in his 20-horsepower White steamer for a six weeks' trip in the North. They will go through Maryland and Pennsylvania to Bedford Springs, then to Albany and Niagara Falls, possibly crossing into Canada.

ANOTHER 5,000-MILE TOUR IN THE NORTH.

HUNTSVILLE, ALA., Aug. 9.—After making the record of disposing of 747 cases during the sixteen months that he has sat on the bench as Federal judge, Oscar R. Hundley left last week for the East on a well earned vacation. Judge and Mrs. Hundley will be the guests of Hon. Henry D. Eastbrook, of New York, on a 5,000-mile tour through the Northern States.



Henry Farman Making One of His Successful Flights in His Aeroplane at Brighton Beach, New York City.

FARMAN'S BACKERS HAVE BACKED OUT.

Farman and his aeroplane made their last flight in the vicinity of New York last Sunday. On two days of the preceding week the weather was unfavorable, and although the machine performed well on all the other days, business at the Brighton Beach track was far from prosperous. These developments were made public Monday, when it was discovered that the chief promoter of the exhibitions had made a sudden flight in the homeward direction of St. Louis.

T. R. MacMechen, the only member of the original syndicate remaining in New York, said that of the $24,600 which Farman was to receive for a ninety-days' engagement in this country only about $7,500 had been paid him. At the end of last week there was due him a week's salary of $1,680, $800 bonuses for flights and $800 for expenses. Mr. Farman handed in a bill for this sum, and when the syndicate failed to produce the cash, said he considered that it had broken its contract with him. He has not yet made any announcement with regard to his plans for the future.

The trouble seems to have been that the public was not sufficiently educated in aeronautics. So many "sky pilots" have been going about the country with gas bags fitted with bicycle engines that Farman's low, swift flights, although more significant of the future, seemed comparatively tame.

Farman Has Many Offers, But—

Any number of press agents may be found around Mr. Farman's quarters at the Hotel Astor, with their routes all booked and long lists of dates made out, but when it comes to putting up the cash one and all grow suddenly bashful. Monday Mr. and Mrs. Farman went out to the Oranges and visited Edison, who, it is said, made impromptu plans for an aeroplane of his own. Another report is that Farman has offered to sell his aeroplane to the government.

FRENCH AERONAUTS MUST RISE EARLY.

PARIS, Aug. 7.—French aeronauts and their followers must rise early if they wish to indulge in their favorite sport at Issy-les-Moulineaux, the police authorities having decided that the ground shall only be open to them from daybreak to 6 A.M. Although such an early hour has been chosen the sky pilots must have the presence of seven policemen and one subbrigadier, at a cost of $4 per day.

These precautionary measures are the outcome of the closing of the ground by order of the chief of police. Naturally the aeronauts protested at being deprived of the only convenient training ground in the neighborhood of Paris, and protested with such effect that Chief of Police Delpine withdrew his interdiction on the conditions mentioned. Issy being practically a portion of the City of Paris crowds in the past have been too numerous, in the opinion of the police, to render the acronautical experiments altogether safe for the public.

WRIGHT MAKES FLIGHTS IN FRANCE.

LE MANS, Aug. 10.—The French press unites in enthusiastic praise of Wilbur Wright, the Dayton, O., aviator, and his aeroplane. The *Figaro* declares that "this decisive victory creates a revolution in the scientific world." Saturday Mr. Wright flew successfully before a number of experts and pressmen, and Monday did even better. After two false starts, he got away in good shape and covered about two kilometers in one minute and forty-three seconds, causing the machine to describe a figure eight. It is reported that a French syndicate has offered $100,000 for the manufacturing rights for France and her colonies, provided within a reasonable time Mr. Wright makes two flights of fifty kilometers, carrying two persons. Mr. Wright is not likely to attempt to fulfil these conditions for some weeks.

Gastembide and Mengin's Monoplane, "Antoinette II," Flying at Issy-les-Moulineaux, near Paris.

CHICAGO, Aug. 6.—America's first demountable rim contest, conducted to-day by the technical committee of the Chicago Motor Club over the Chicago-Elgin-Aurora-Chicago century course, was won by the Diamond demountable, with a total of 5 min. 36 2-5 sec. for the changing and readjusting of the four rims that were changed by two workmen during the run. Second honors went to the Continental rim, mounted on a Packard roadster, 5 min. 48 sec. being required for the task. Third and fourth places were awarded to Fisk demountables, one set fitted on a Knox four-passenger roadster requiring 5 min. 49 4-5 sec. for original changes and adjustments at the end of the run; and the other set, on a Thomas-Detroit roadster, requiring 7 min. and 10 1-5 sec. for original change and final adjustment. Fifth honors were carried off by the Nadall demountable, 7 min. 35 4-5 sec. being required for the changes and tightening of three attaching shoes which had not been sufficiently tightened when the change was made. The Nadall demountables were on a Pierce six-cylinder touring car.

The object of the test was twofold, to determine first the speed of changing the different rims, four on each car; and, second, to determine the reliability of these rims as could be judged from 100 miles of traveling over dusty, gravel and stone roads at an average pace of 20 miles per hour. The technical committee of the club found it impossible, because of the absolute lack of previous contests of this nature, to take into consideration any other than these two phases of the rim contest, and its awards were based solely on these two.

The plan of the test necessitated the changing of all the rims before Elgin, 42 miles from Chicago, was reached, and the remainder of the trip was to determine if the rims, as placed on, held securely, which was decided upon by a close examination of the rims at the completion of the run, when loose nuts and creeping rims were looked for. Wherever any of these were discovered, the contestants were required to tighten the nuts, and in case of creeping rims to loosen the rim and place it in its original position, which was determined by stamping, with the center punch, the rim and felloe. The time spent in this adjustment, or tightening, at the end of the run was charged double and added to that required for changing the four rims, the total thus obtained being the figures given above.

The quickest change on the road between Chicago and Elgin was made by the Knox-Fisk combination, changing the four rims in 3 min. 56 sec., which is an average of 59 seconds per rim—a good performance, and one which brought out well the quick detachability of the tire as well as the team work of F. J. Moffatt and W. H. Crewdson. This car would have been the winner at the completion of the run had not two of the rims, the left rear and right rear, creeped during the contest, necessitating the jacking up of these wheels, loosening the nuts holding the rims and slipping the rims to their original positions. In this readjustment 31 3-5 seconds were needed for the left rear and 25 seconds for the right rear, adding in all 36 3-5 seconds to the original performance. This time, however, was doubled according to the rules, so that 1 min. 53 sec. in all was added.

The Diamond demountables, which won the contest, were attached to a heavy Isotta-Fraschini car which on the run from Chicago to Elgin got off the route and met the other contestants at Elgin. This departure from the route was sufficient to have disqualified the car, but the other contestants were willing that the Diamond crew should have a chance to do the work and agreed to allow them to make the changes at Elgin. Three of these changes were made in Elgin, and the fourth after leaving Elgin. In the original change the quickest work of the Diamond crew, consisting of William Kesner and George Brewer, was 59 2-5 seconds, made on the right front wheel. The changes of these rims averaged 78 seconds per rim. In the final examination it was discovered that four of the nuts holding these rims had loosened, one on the left rear and three on the right front. In all 12 1-5 seconds were needed to tighten these, which added 24 2-5 seconds to the time.

The Continental rims, fitted to the Packard roadster, made the first change in 1 min. 2 sec., which was the fastest of the four, the workmen, F. W. Sanford and J. Hessler, showing particularly good team work, the results of previous practice. In making the second change, one of them got ahead of the other, with the result that some of the nuts had to be loosened before the rim fitted properly, making the change 1 min. 58 1-2

seconds. The Continental averaged 79 seconds per rim for the four rims in the original change. At the completion of the run, five loose nuts were detected.

The best time made by the Southmayd-Wilcox combination, with the Fisk-Thomas-Detroit, was 54 seconds flat, 4-5 of a second above the record made on the Fisk-Knox. The average time per rim on this car was 60 4-5 seconds per rim. At the final examination, three of the rims had creeped, and in readjusting these the following time was required: 29 3-5 seconds for the left front, 35 seconds for the left rear, and 28 3-5 seconds for the right rear. This added 1 min. 33 1-5 sec. to the original time which, when doubled, made 3 min. 6 2-5 sec.

The quickest change made by Paul Hoffmann and J. Vilas on the Nadall demountable was 1 min. 17 2-5 sec. The average time per rim was 93 3-4 seconds. Changes on these rims were greatly hampered by the use of a ratchet wrench which was worked back and forward, necessitating three movements of the wrench for each complete rotation of the nut. All of the other contestants used the breast wrench which operates the same as a brace-and-bit for boring holes. A further handicap was that this rim carried threaded valve covers, which had to be removed in changing each rim with the exception of one; whereas, the only other contestant to have a valve piercing the felloe was the Continental, and on these valve covers were not used. The two Fisk and Diamond used blind valves, by which is meant the valve in the case of the Fisk came out horizontally through the side of the demountable rim, and in the Diamond the valve stem was cut off flush with the rim, so that in these demountables no trouble whatever was caused by the valves. When the Nadall demountable was given its final examination it was discovered that three rims were in perfect condition and no change had been made in the fourth from the time of its attachment, but the inspection showed that three of the nuts on three expanding shoes had not been screwed up as tight as the others when the change was made, and the technical committee required these to be tightened, there beinf 17 seconds so consumed. When making the original changes but one tool was permitted, but the assistant used a tool tightening four of the expanders. This was in violation of the rules and the committee required them to be loosened during final examination, and time required to tighten them taken.

While the contest took into consideration only the time required to change and the reliability as indicated by 100 miles of road service, the contest brought out many interesting facts relative to the demountable rim, which is very much of an unknown quantity in America. The quick detachability and attachability comprise one factor, and the ability to withstand road work another factor. In detaching the rims the Fisk crews demonstrated with phenomenal alacrity, the No. 1 crew removing a rim in 18 seconds and the No. 5 brigade repeating this performance twice. The Diamond rims were taken off in 22, 39, 46, and 21 2-5 seconds, respectively. The Nadall rim was removed in 35, 37 2-5 and 39 seconds, respectively, the time not being taken for the removal of the first rim. The Continentals were removed in 25 3-5, 26 2-5, and 28 1-5 seconds, respectively, the time not being taken for the removal of the first rim. Time on the No. 1 Fisk-Thomas Detroit for removal were 18, 18, and 21 seconds, and on the No. 5 Fisk-Knox 24, 18 and 18 seconds, respectively.

The rules covering the test called for the following arrangement in the change of each rim, all of the contestants changing the left front rims on the same spot on the side of the road at Addison, the right rear rims on the roadside at Ontariovill:, the right front in the long grass at Bloomingdale, and the right rear in the middle of the road on a street in Elgin. In making the change the car was stopped and the two workmen allowed to place a jack on the ground opposite the middle of the car, to place the rim tool on the running board and lean the rim to be attached against the car opposite the front seat. The two men stood close to the jack. Two timers with stop watches recorded the time, which was taken from the word "Go" until the rim was changed and the old rim, the jack, and the tool back in the position at the side of the car. An observer rode on each car to see that no work was done on any of the cars during the entire run, except at the changing depot.

In looking over the four makes of demountables competing it was noted that on four of them are loose nuts which are taken off and must fall on the ground or be held in the hand while the rims are being changed, whereas on the fifth, the Nadall rim, there is not a loose part that comes off except the valve cover. The Fisk rims are secured by a split expanding rim or ring of "V" cross section which is forced into an opening at one side between the wheel felloe and the demountable rim. The tightening of a set of nuts on bolts passing horizontally through the wheel felloe and the "V" ring, tighten the rim in position. In brief, it is a wedge action, the wedge forced between the inclined permanent and demountable rims by the tightening of the nuts. The Continental principle is the same, except that they use six separate wedges, which are forced between the permanent and demountable rims at one side, there being one wedge for each bolt. In removing these rims all the nuts and the majority of the wedges are taken off, although it is possible by removing half of them to slip the rim over the other half without removing them.

In the Diamond rims are a series of lugs on one side of the demountable which slip over transverse bolts through the permanent wheel felloe and a set of nuts holds the rim in position. In the Nadall rims are six shoes an inch wide and 3 inches long mounted on stems 3 inches in length, which are fitted radially at regular intervals in the wheel felloe. The periphery of these shoes is curved with a slightly shorter radius than that of the inner surface of the demountable rim and in the rim are cut arc-shaped sockets to receive the shoes. The stems of the shoes thread into a sleeve in the wheel felloe so that by tightening a nut on the end of the stem, which protrudes through the felloe between the wheel spokes, the shoe is forced into the socket in the demountable rim thereby anchoring it.

Herewith is the complete summary of the contest:

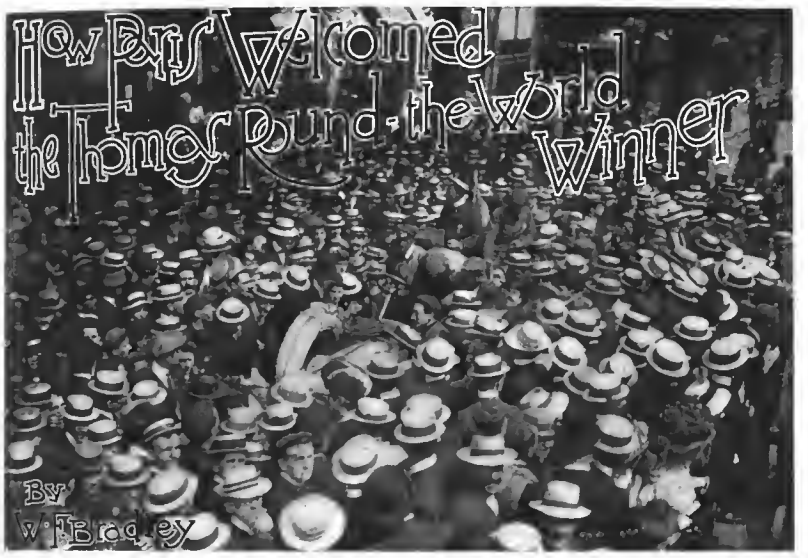
No.	Rim	Car	Weight	Left Front	Left Rear	Right Front	Right Rear	Total	Addttonat (Doubled)	Final Average
4	Diamond	Isotta	4,335	1:02 2-5	1:26 1-5	:59 2-5	1:45	5:12	:24 2-5	84 2-20
3	Continental	Packard	3,230	1:02	1:58 1-5	1:05 2-5	1:10 2-5	5:16	:32	87
5	Fisk	Knox	2,810	1:07 1-5	:57 2-5	:53 1-5	:58 4-5	3:56	1:53	87 9-20
1	Fisk	Thos -Det.	3,040	1:11 3-5	:57	1:01 1-5	:54	4:03 4-5	3:06 2-5	107 11-20
2	Nadall	Pierce	3,955	2:02 2-5	1:17 2-5	1:25 2-5	1:29 4-5	6:15	1:20 4-5	113 19-20

VISITORS SHOULD RESPECT CONNECTICUT LAW.

HARTFORD, CONN., Aug. 10.—Because of the numerous complaints that have been made by members of the Connecticut Automobile Association regarding the recklessness of visiting autoists from outside the State, Secretary G. K. Dustin has written to the various clubs situated in other States near the Connecticut border, requesting that they urge upon their members the necessity for respecting the Connecticut statute, as only in this manner will it be possible to retain the present liberal measure.

PHILADELPHIA AUTOISTS JUBILANT.

PHILADELPHIA, PA., Aug. 10.—Automobilists of this city are rejoicing over the approaching completion of a through road to Atlantic City, on which there can be no objection to reasonable speeding. It is expected that the opening celebration will be held on Labor Day. When finished the road will be one of the finest in the State; there are few sharp curves, and most of the distance is thinly settled. The route lies through Westville, Glassboro, Clayton, Malaga, Downstown, May's Landing and Pleasantville.



PARIS, Aug. 5.—Paris was dozing; it was too early for the theaters, and, although dinner was over, there was no necessity to hurry away from the coffee. The policeman at the corner of the street pricked up his ears, looked down the dimly-lit Faubourg Poissonnière, pulled out his white baton and prepared for action; he had heard the definite note of an open exhaust. But before the baton could get into action the noisy exhaust was joined by a shrill call on a mouth trumpet, a travel-stained automobile swung into the boulevard, and pulled up sharply at the door of the *Matin*. New York-Paris was finished; the Thomas Flyer, America's champion, was victorious. The *Matin* furniture had been wrapped in dust sheets for the night. But the city lived up to its reputation by assembling a crowd at a moment's notice, and the newspaper had the champagne ready to be uncorked when Schuster, Muller, Hanson, and McAdam, the bronzed occupants of the over-freighted looking car, walked upstairs to report their arrival.

When the simple ceremony was over, for the *Matin* had apparently lost enthusiasm and made no pretenee at drum beating, twilight had changed to night, and the order was given to run for Fournier's garage, the last resting place on the long journey. As the car sped down the boulevards, exhaust and trumpet vying with each other for supremacy, a policeman rushed into the roadway and yelled "Les lanternes!" Schuster sped on. One hundred yards further another arm of the law attempted to stop the car. Schuster drove straight ahead. A third and a fourth followed suit, then one bolder than the rest stepped into the roadway, displayed his baton and refused to budge.

St. Chaffray attempted to explain, but the Paris police forec had no more enthusiasm for the New York-Paris victor than official French motordom. The ultimatum was lighted lanterns or the police station. McAdam was for the latter; Schuster had had enough roughing. During the hesitation the pilot, who was running ahead on a bicycle, returned, pushed a way through the crowd, mounted the running board and displayed a light.

"Allez!" and down the boulevard the car shot, to a rousing cheer from the crowd.

Having left New York at noon on Tuesday, February 12, the triumphant Thomas had occupied 169 days 2 hours in its trip of 20,000 miles across America, into Alaska, over the Pacific, across Japan, and through Asia and Europe to the French capital. It is the longest continuous run ever made by automobile, and certainly the most difficult ever undertaken.

Prince Borghese, winner of the Pekin-to-Paris race, occupied 62 days in linking the East with the West. Schuster and the Thomas did the longer trip from Vladivostok to Paris, with a car that had already undergone the rough usage of a trip across the "States" in winter and a journey over mountainous Japan, in 69 days. For the Italian car there was a perfect gasoline supply, fairly good weather, pilots through France and into Paris, and only three men to be carried. For the American car, gasoline had often to be sought in drug stores and elsewhere, rainy weather accompanied the car, much time was lost at the customs and finding the highway from Belgium to France a detour took the car over rough paving stones, instead of the macadam highway which runs into Paris, and, in addition to driver and mechanic, two passengers were carried for the entire distance.

When the official reception took place at the *Matin* at noon on the day following the arrival, there was enough enthusiasm in the streets to keep the policemen busy all the time, but not a sign of any kind that the official automobile world had read of the arrival of the American car. The crowds cheered, struggled for souvenirs, and elbowed one another in their endeavors to find a vacant place on the bonnet for another signature. Those who make, sell, and deal in cars shrugged their shoulders and remained sullenly at home. Nevertheless, if E. R. Thomas, Harry S. Houpt, and John E. Bowles had been in Paris they would have enjoyed thoroughly the "welcome" given by automobile France. Its scantiness told a story that would have been relished by those responsible for the American entrant in the endurance race round the globe.

George Schuster had not changed into a dress suit as he took his first meal in Paris in the fashionable Grand Hotel, for the simple reason that he did not possess one. The four men had four suits among them, and each wore one, the only extras being a few articles of lined stuffed into a small grip. But it was an interesting story of hardship and adventure overcome by pluck and determination that was told in one corner of the dining hall on the night of arrival, interrupted now and again by some visitor who introduced himself as an American, and offered his congratulations as such.

Naturally the American driver was disappointed that the German car should have forged ahead on the last portion of the journey, and was as desirous of giving his explanation as the listeners were of hearing.

Schuster Tells the Story of the Race

"When we reached San Franciseo," said Schuster, "the Protos was being shipped by rail from Ogden, Utah, to Seattle, the rough journey across the States having completely disabled it. We had a lead on the De Dion and the Zust, and on that account, after reaching Seattle went ahead to Valdez, in order to see for ourselves what conditions were in Alaska. It was decided to abandon the Arctic portion of the journey, orders coming that the route should be across Japan, to Vladivostok, then through Asia and Europe to Paris.

"The day I returned to Seattle I met Lieut. Koeppen at the steamship office, where I learned that he had just arrived, and was expecting his car by rail the following day. The Zust, Protos, and Thomas sailed together for Kobe, Japan, crossed the Island of Tsuruga steamed to Vladivostok, and there found the Protos rebuilding under the care of men sent out from the factory. The German spent seventeen days in Vladivostok fitting out; the American spent four; the two cars leaving on May 22, the Protos at 8 A.M., the Thomas at 11 o'clock.

"From this point there was a continual struggle for victory between the Thomas Flyer and the German Protos, the latter finally being successful, thanks to the rebuilding at Vladivostok

and also the excellent manner in which it was handled on the journey through Siberia, as it also met with many misfortunes.

"Japan was a picnic, with a few scares thrown in when the narrow, flimsy bamboo bridges had to be crossed, and some strenuous calls for the low gear on the mountain passages. Nevertheless, the kindly hospitality of the natives caused forgetfulness of all the difficulties, leaving only the memory of the good time spent in crossing the land of the little brown man.

"The trouble began when Vladivostok was left behind. The roads were not any worse than in America, but when at home we could always count on food and a clean hotel at the end of a journey. In Manchuria and Siberia there was neither, the hotels being bug-ridden hovels that made one glad to sleep on the veranda, in stables, in wagons, on the ground; anywhere, in fact, but under the roof of a house. Food was as bad, the staple article of diet apparently being a coarse black bread, the crust of which could be eaten, but the inside of which was absolutely indigestible. Eggs could be obtained sometimes, tea always, coffee never.

"Rain accompanied us when we left Vladivostok and remained with us for eighteen days in succession. At that time we had not taken to the railroad track, but were endeavoring to push along over the soft, boggy country. On the first day we covered twelve miles, the second about the same distance, and the third a little less. Before we were many miles out of town we overtook the Protos, stuck in the mud, pulled them out by means of a tow line, and left them.

"After three days' traveling we reached Nikolsk, went on the railroad track—although permission had not then been accorded—but when 100 versts further on stripped our bevel gear and had to lie up for repairs. The Protos, coming along slower, received our permit for traveling on the track, and in this way saved itself a long grind through the mud. There were places where traveling on the railroad was good; there were other spots where it was so shaky that I thought my teeth would drop out of my head. The ties were not sunk, but each one raised a considerable distance out of the ground and just wide enough apart for the wheels to drop in between them with a thud and be pulled out again with a jerk. Our first accident happened on a curve where the ties were just sufficiently close together to allow both front and back wheels to drop in together and remain locked. In the fearful wrench which the car received the bevel gear stripped.

"There were some narrow escapes with trains, and at one time the withdrawal of permission to use the track, owing to the Protos having held up the express for four hours. After passing Kharbin, in Manchuria, where we left all the clothes excepting those we stood in, with orders that they should be shipped to Paris, we had some rough traveling, during which we stripped the second speed gear. A spare was telegraphed for, and I went back to Kharbin to get it. It failed to arrive, and I returned to the car to find that in the meantime Muller had put in a couple of stumps to replace the missing teeth. With this makeshift repair we continued, after ordering the spare part to be shipped ahead to Omsk.

"Later our repair broke down, and in order to get the spare part I had to travel 658 versts by relays of teams, a journey that was done in four days by changing teams every 90 versts. There was a reason for the hurry, the Protos then being in our rear, but rapidly drawing up. I wished to get back and make the repair before they caught us, but was not able to do it, the car passing me when I was within but a few miles of the end of the return journey. I reached the car at 1 o'clock in the afternoon; at 4 o'clock we were away again.

"At Moscow we were held up for one day by repairs to the clutch shaft, and again after leaving Berlin lost some hours doing the same repair work."

"And how did the motor stand it?" inquired one of the listeners.

A smile spread over the face of the driver as he replied, with justifiable pride: "Perfectly; we dismounted it at Chicago, in order to verify the main bearings, put in a new set of spark plugs that somebody gave us, and have not touched anything since. Even the spark plugs are there, as good as on the day they left Chicago, and that is saying a great deal."

"How were supplies of gasoline and oil arranged for you?"

"There was supposed to be a complete train of gasoline stations across Siberia," replied Schuster, "the arrangements being in the hands of the person who supplied the Pekin-Paris contestants last year. Unfortunately they were not perfect this time, the gasoline sometimes being there and sometimes being entirely absent. When the supply failed, it was our business to search round town until we could find any; not being certain of the next stage, we frequently filled the tank of the car and carried a reserve supply with us in large bottles, each man holding a bottle on his lap, there being no room for it on the floor.

"Right from Vladivostok to Moscow the order was to push ahead as fast as possible. We had no need for lanterns, for a gray light lasted until 11 o'clock at night, and it was daybreak again at 3 o'clock. When Nijni-Novgorod was reached our difficulties practically ended, for we struck roads that in comparison were so good that we imagined we were on feather beds. We had to pay duty entering Germany, and on leaving the country had to visit three different towns before the amount was returned to us. Ten minutes after we got it we had to hand it out to the Belgian authorities, from whom we were reimbursed on the first request. Finally, entering France on our last day's run from Liege, 1,113 francs had again to be deposited as duty on the car. Getting near Paris we missed the road, and, instead of the macadam highway, had to travel for a considerable distance over rough granite *pavé*, that cut down our speed considerably. Though there were so many roads to Paris, nobody on the route appeared to know which was the good one."

"How were you treated along the way?"

"Well, there was no hostility anywhere, if one can regard the attacks of insects as non-hostile. We have all a lively remembrance of the thousands of creepers that attacked us in some of the Siberian hotels, where cleanliness was an unknown quantity. In one German town the landlord of the hotel looked us over when we asked for a dinner, then led us away to the servants' quarters. We forthwith removed over to the rival establishment on the other side of the street and were royally received."

"What about Alaska?" queried somebody.

"Time to think about that when airships are perfected," exclaimed Captain Hanson.

"There was as much hardship on this trip as any of us desired," exclaimed Schuster. "At times I doubted whether any car would get through. Now that we have finished, we are glad that we have got first place for America. We have been running on three hours' sleep per night for so long and have had so little acquaintance with real beds for the last four months that I doubt if we shall be able to sleep to-night. I suppose there is a bath upstairs and we will try what hot water and clean sheets can do, anyway."

"Good-night!"

This Picture Was Taken After Arrival in

CONCERNING THE ELEVENTH YEAR AUTOMOBILES

By THOS. J. FAY, President Society of Automobile Engineers.

IT has been freely predicted all along that as the result of improved methods of construction, much cheaper materials and well-developed factory organizations working on a large scale, it would be possible to produce a good automobile to sell at a fraction of the prices which obtained a few years ago and also be able to turn out a vehicle that would be superior in every respect to the cars of that time. In 1905, not to go any further back, that day seemed to lie in the indefinite future, but now, in view of the announcement of a number of makers who have already laid their plans bare for the coming year, it appears to be close at hand, if indeed, it is not already here.

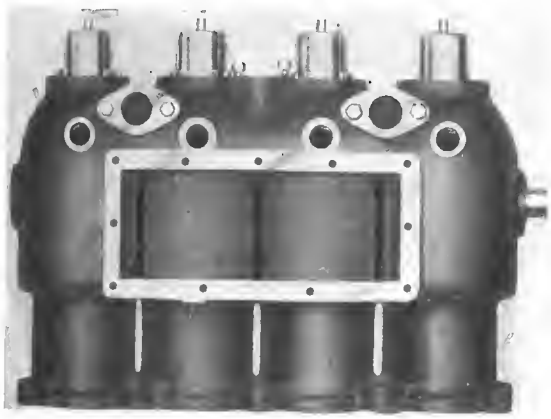


Fig. 1—Block Casting of the Chalmers-New-Detroit Motor.

To truly appreciate the situation as it will obtain for 1909, it will be necessary to go back a pace and review the history of the industry. In the early days inventors were struggling with the problem, just as inventors invariably do, in secret and in dread, fearing on the one hand the invention would not work, while on the other hand their secretiveness was enough to keep honest capital "in the next county." These were the days of original ideas, freakish designs, doings in a small way, and a conglomeration of the good and the bad. Times change, and, with time, things change. The next step in the chain of events was most conspicuous for the selection of the good points from the 57 varieties.

If it is true that the cars of the eleventh year will be generally superior to the cars of the past, it is also true that the reasons should be no secret. A secret is an embryo idea, as a rule, while the cars of the eleventh year are cars; in fact, they can be seen on the road, and there are thousands of them being constructed at the present time.

That the purchase price of these cars will be low, quite as low as the author has had the temerity to intimate, it can be adequately substantiated by merely citing a few instances in crystalline form of some of the 1909 models:

E-M-F	30-horsepower	$1,200
Cadillac	30-horsepower	1,400
Kisselkar	30-horsepower	1,500
Chalmers-Detroit	30-horsepower	1,500
Overland	30-horsepower	1,500
Rambler		1,900
Jackson	30-horsepower	2,000
Mitchell	35-horsepower	2,000
Selden	35-horsepower	2,000
	30-horsepower	

This list is not intended to convey the impression that there are no other cars in the class. As the author is able to pay attention to the other cars, he will take them up, with a view to displaying their merits. Nor is it intended to overlook the existence of the larger and more expensive cars, or that great improvements have been made in them. It is well known that they represent far greater value for the price than ever before. The gist of the present discussion takes into account the cars at the lower prices only.

In What Are the New Cars Conspicuous?

First and foremost, the new cars are conspicuous for the entire absence of elaborate body work. We can no longer expect to see a $1,200 body on a car costing no more. But the new body work is neat and strong, and its comfort is by way of a fact rather than as a theory. In body work the idea of aluminum in fancy shapes and in fantastic configuration, backed up by a thick lining of plaster-of-Paris, that the whole may be stronger, will no longer obtain. Plain, straight work affords strength, with grace and lightness besides. It is not that aluminum may not find a place in the simplified bodies of the cars in question, for aluminum there will be when this product will best serve the ends to be sought. Body work in the simple form it has assumed, in this same age of the automobile, is free from the contortions to which aluminum so adequately lent itself. The idea that the aluminum bodies were lighter than those made otherwise has long since been exploded. The cost of the body and the cost of keeping it in presentable form will be but a small part of what it has been. In the past the body was the important part, important because it was the only part, perhaps, that many of the patrons could pass judgment upon, and it is no stretch of the imagination to observe that the "seventeen rubs of varnish" had a lot to do with the acceptability of the whole. Time tells the tale, and time, in this case, tells the user that what he needs is good machinery, plain body work, and, above all, a power plant that will survive strenuous service. What has experience taught?

Once designers are convinced of the genuineness of the conclusion that self-contained power plants constitute all to be desired, it does not take them long to put their conclusions into practice. Users of cars can choose for themselves as to the details more nearly according with their ideals, but the same users will probably decide that the

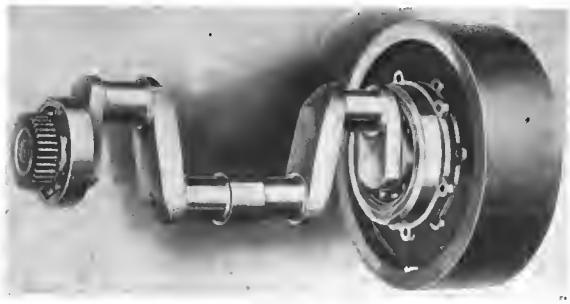

Fig. 2—Chalmers Two-Bearing Crankshaft Complete.

chassis frame of an automobile is too unstable as a platform on which to erect the machinery in subdivided units, if there must be any interrelation. There are two plans in advancing the idea of doing away with the chassis frame as the connecting member between related parts of a unit, or as between units that must work in unison. If alignment is essential to the good of the whole, that alignment cannot be fairly expected if the chassis frame is to be responsible for it.

In the earlier work it was the chassis frame that was depended upon to insure alignment between the motor and the transmission. When it was found that reliance could not be placed upon the frame, designers sought other means, such

as the self-contained power plant and the transmission axle. Both of these methods give assurance of the fact that the chassis frame will not render the machinery *hors de combat* should a sag follow a little hard usage. A sag in the chassis frame is a natural sequence of the use of the car in almost every instance, because until the sag does take place the metal is not in a state of tension. If this condition of tension were not to be anticipated, there would be no need of a frame; at all events, so much frame as is our wont to provide for an automobile under prevailing conditions of design.

No matter how great the section of a beam or a member of any sort, if it is loaded, however small the load, the result is a deflection. In the modern self-contained scheme of construction, there are no related parts that can suffer as a result of deflections because there are no

Fig. 3—Simplicity of the Chalmers-Detroit Control.

members intervening that (*a*) are of any notable length; (*b*) that would have to be used of such light section as a chassis frame; (*c*) that are subjected to the strains incident to road conditions.

As before stated, no matter what the section or the material, or no matter how small the load, a deflection will obtain. If this is so, how necessary it is then to be sure of a definite limit to the causes of the deflection and that the length of the member be, say, 10 inches, instead of 100 inches?

Obviously the self-contained construction is the form that renders it possible to avoid the greater of the two deflections. If it is possible to get on at all with the greater tendency—and it seems to be—what a gap lies between trouble and the man who puts his money in a self-contained plant from this point of view. There are so many ways of courting trouble that it is not necessary to find it by way of considerable deflections in a long beam. The repair man cannot fix a chassis frame that sags. He may charge for attempting to accomplish the task, but it is the same frame in the same car with the same fundamental difficulty ever present, awaiting the moment when it will assert itself.

Modern Construction Less Expensive.

Fortunately, the modern construction is less expensive to evolve than the way we were taught by the "foreign contingent," whom we must hold responsible for the "distributed components of cars." Even in the matter of repair parts, the policy is one sure to advance the industry as a whole by leaps and by bounds. Ford, for instance, will sell all the parts that go to make a car at the price of the complete car. Who can find in this any sign of the old adage that "In repair work we have legitimate prey." That the Ford is not an isolated case is evident from the following:

Fig. 1 shows the four cylinders *en bloc*, as put out by the Chalmers Detroit Company. The set argument against this method of cylinder construction is that the four cylinders *en bloc* are very costly, and if something happens to one of them four must be purchased to make the replacement. But in this case the four cylinders will be replaced for the sum of $35—less than half the cost of a single cylinder in a well known foreign car. Who would refuse to have all the cylinders of his motor replaced at less than half the cost of replacing one?

Of the details of construction of the cars of the eleventh years space will not admit of the mention of more than a few. It is understood that no mention will be made of old and well-known methods, except in the light of new applications.

Fig. 2 illustrates a crankshaft with only two bearings, the motor being of the four-cylinder type. Usually such motors have at least three bearings and many of them have five. At the first jump out of the box many will say: "It is wrong." Obviously, we could not get on with one bearing, but fortunately it is not necessary to try, nor could we do with two, unless the length of the crankshaft be short enough to bring its deflections within the limit experience shows will be safe. As said before, the deflection (considering the crankshaft as an abstract beam) is in proportion to the cube of the length. Let us see what this means in a comparison of two motors, the one of to-day and the other of but a short while ago.

In the modern motor with two bearings the distance between them will be, say, 23 inches. Let us assume also that the strain will be proportional to the square of the diameter of the cylinders, and that in the modern motor the bore of the cylinders (for the same power) will be 64 per cent. of the bore of the cylinders of two or three years ago.

Let us say that in the earlier motors the distances between bearings was 20 inches. Now, let us make a rough comparison, thus:

In the three-bearing motors:
The strain $s = 100^2 = 10{,}000$.
In the two-bearing motors:
The strain $s = 10{,}000 \times .64 = 6{,}400$.
In the three-bearing motors:
The cube of the length = 8,000.
In the two-bearing motors:
The cube of the length = 12,167.
In the three-bearing motors:
Factor of deflection = 80,000,000.
In the two-bearing motors:
Factor of deflection = 77,828,800.

In other words, the two-bearing crankshafts of to-day are not required to work as hard as were the three-bearing motor crankshafts of yesterday. But that is not the whole story; the three-bearing crankshafts did work, notwithstanding the inferior nature of the steel then in common use. The steel of to-day is very much superior to that of a short time ago; that is, the steel that an automobile engineer will contemplate using in a product of any consequence at all. Thus the steel is better and the strain is less. The method of approximating the results is simplified in order that the non-technical will be more likely to understand the nature of the problem and the accuracy of the conclusions. The idea is not to convey the impression that only two bearings should be used in every case, or that it is a crime to use three. What we wish to show is that hasty conclusions are out of place in a matter of this sort and that time renders matters clear. It is proper to add, however, that it is a decided advantage to have a short motor, because then something besides the motor can find space in a car of a length capable of maneuvering on an ordinary roadway.

The main point to be made is this: Are the cars at the

low prices to be inferior to the cars of the past costing double or even treble the price of the new product? How shall this question be answered. Refer to Fig. 3 and observe if the space is cramped, if the scheme is not clean cut, and compare this with other products of the past to determine if there has been any retrogression.

Fig. 4 shows the details of the steering gear and its related parts; note the depth of the front end of the side frame; see the wealth of bearing surface provided for the steering members; observe that the means for oiling are adequate.

Fig. 5 shows a car upside down. What product in the past exhibited a cleaner bottom? Wherein lies the retrogression? The author fails to note even a tendency; indeed, may we not say this tendency is in the direction of improvement?

It may be said the new cars are smaller, but with the present short motors and a wheelbase of, say, 110 inches, it is a question if the new product will not afford more available space. It was not by curtailing then that the new product was rendered low priced. Suspicion is prone to run rampant, and it follows that all courses of cost reduction must be explored ere the situation can be accepted without a struggle. Did they reduce the sizes of the wheels? In many instances the sizes were actually increased over the practice of the past, and in no cases are the tires below the sizes recommended by the tiremakers.

The man who has to pay for the tires, however, never would have arrived at the right conclusion, since the man who sees through a dollar is as blind as a bat. It is the man who gets his line of vision on another man's dollar that can tell how big the tires ought to be, and even he may fall short of nerve equal to the occasion. At all events, the low cost of the product to be placed before the 1909 public was not rendered low by stinting the tires, which is more than can be said for some of the cars of the past.

If the cars are big and roomy, if the work bears all the earmarks of a high standard, if there has been no retrogression in the matter of style and finish, since the price is so low, there are those who will say: "The materials must be very bad, indeed."

How About the Quality of the Materials?

Actually the materials will be better, far better than they ever were before, no matter what the price of the automobile, and for the same reason that the price of the automobile can be lowered. The most inferior materials of to-day, entering into automobile work, are superior to the best to be had but a few short years ago. What we have to-day are not high-priced special products to be used sparingly in a few spots to give the press agent a chance at his stock phrases. We have to-day a good average product, the worst of which is not so high-priced as to require a nerve tonic with every pound purchased. In the earlier days, engineers relied upon the vendors of the steel, and sometimes they were safe in doing so, but the occasions when they failed to get the right material were frequent enough to keep them in hot water almost constantly. Then the purchasing agents of the automobile companies were not skilled in the matter of the quality of steel, and to them price was the whole story. Bessemer steel was very low in price, and Bessemer was what they "landed" every time.

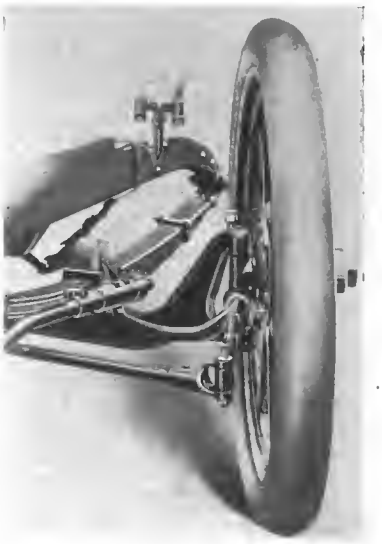

Fig. 4—Suspension, Front Axle and Steering Knuckle Assembly.

The Present Plan of Building.

To-day the situation is quite different in that the makers of cars pay quite as much attention to the quality of the material as the occasion requires, but they pay more attention to the question of where to put the several grades of available product. The proper way to put it, then, is to say "appropriate materials" are the order of the day.

Referring to materials, it is not at present the idea to start with highly resistant materials (normally highly resistant), for such products are over costly; moreover, they resist

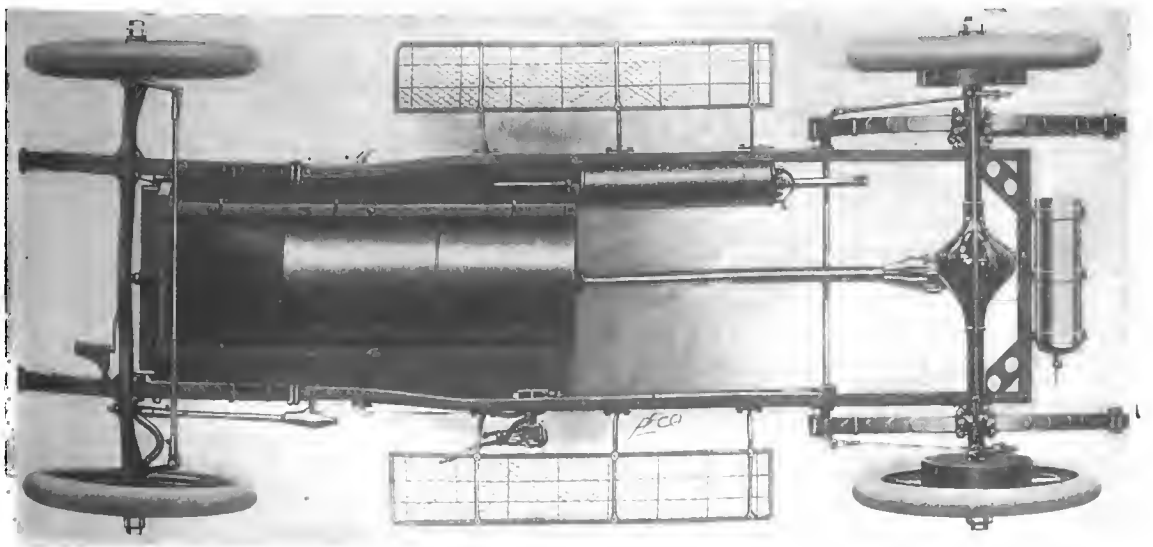

Fig. 5—Clean Lines of the Underbody of the Modern Low-priced Unit Construction Type of Automobile.

machining with a tenacity that is scarcely equalled by their after performance. The current idea, which is the idea that will survive for 1909, takes into account the fact that certain materials are capable of being rendered hard or soft, dynamic or ductile, or both, and initially the same materials are soft enough to machine. These materials when fashioned into the desired shape, leaving a few thousandths to permit grinding, are then ready for the heat treating process through which they are rendered fit. In the normal state, the steel may not show such good qualities as one would want, while in the finished state the parts will exhibit just the characteristics most desirable in view of the duties of the parts.

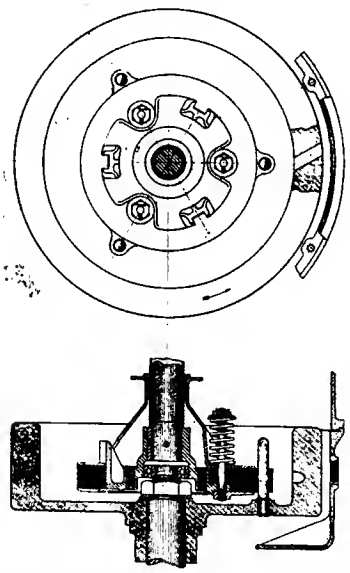

Fig. 6—Plan and Section, Chalmers-Detroit Multiple-Disc Clutch.

Take crankshafts, for illustration; they are costly when they are "slabbed," and it is true the slabbing process cuts the lay of the fiber, leaving less than would be desirable in the finished product. To get away from the cost and the defect, the shafts are die-forged of relatively soft material, by a process such as will not bruise the steel or otherwise leave it in such shape that the after heat-treatment will be futile. The die-forgings thus made are easy to fashion into shape ready for the grinder, which device takes off the final thousandths. Before grinding, the shafts are heat-treated, to render them rigid and dynamic, qualities needed in crankshafts.

Now, there is no known material of a greater modulus of elasticity than the material used in this work. It follows that there is no material that will permit of the use of less, since the torsional angle will be the minimum in the shafts as made. If the torsional angle is thus a minimum, it is fair to infer that the deflections on the whole will be as low as possible. If this is so, the mean of dynamic ability will be in the shafts as made, yet it is the purpose of the heat treating process to accentuate this one property to the greatest possible extent. Crankshafts thus made cost probably one-third of the cost of the crankshafts of the more resistant alloy steel, and so it may be said the cost of the replacement will be very low in comparison. Even so, it does not of necessity follow that the breakages will be more for the initially soft material, because, as before stated, the modulus of elasticity is the maximum possible of attainment in the materials used. It is desirable to be able to replace a crankshaft at small cost, and it cannot be said that the present plan is merely cheap at the expense of merit. What is true of crankshafts is equally true of the other parts.

It is desirable to note the absence of castings in the parts that can well be of die-forgings, showing that the cost of dies is a matter of no moment, now that cars are turned out in large quantities. When cars were built in small numbers, the die problem was uppermost, and resort was had to castings to sidestep the cost. Most of the cars are provided with transmissions with three speeds and reverse, using the sliding gear principle, which, in spite of its mechanical incongruity, seems to be the best all around method. The gears are of ample proportions, and the materials are usually alloy steel.

In the cars in question, it is agreeable to note that the wheels are better than they ever were before, with better proportions of the spokes, and hubs that are more dependable. The question of bearings is one that has settled down to well and favorably known types of ball and roller-bearings, with never a thought of going back to the earlier types of plain bearings. Of the ball-bearings, the annular has the call, whereas the roller-bearings are largely of the Timken and Hyatt types now so largely specified in automobile work.

In the cars for 1909, the magneto is looked upon as finality as the device for the ignition. There are, of course, several makes of magnetos, each of which have their adherents. Magnetos are not provided in every case, except as an extra. Purchasers can best settle for themselves, if they will buy the cars with magneto at the regular price, or if they will select the other cars and pay extra for the magneto. The author thinks they should adopt the magneto even as an extra.

The clutch question in the new cars is more secure than it ever was before, and while all are not multiple disc types, all are far more reliable than they were. Fig. 6 illustrates clutch simplicity, and there are few of us who will fail to remember the complex schemes of the past. It is a source of much delight to observe that the new crop of clutches are primarily strong, yet withal simple in extreme. The clutch illustrated is of the multiple disc genus, of bronze and steel alternately, with the discs of considerable number, and enough of them to do the work without showing wear. In this case, instead of the clutch being housed in, the whole flywheel with the clutch are in an oil-tight housing and the oil is distributed to the clutch by the flywheel.

Brakes, fortunately, are well thought out in all the cars of the future, but special mention is due to those of the builders who avoid the use of facings that will not stand the heat and wear. The "Thermoid" idea is taking hold of such builders as will pay the price, and, in view of the heat-resisting ability of such materials in view of their high coefficient of friction, the brakes should cease to be a source of annoyance, as they were so prone to be in the past, a point which indicates that the new cars are not of low quality as a result of low price.

In conclusion, it may be said that the whole undercurrent of this article is to convey the impression that the cars of the eleventh year generally are the best cars that the builders ever turned out, and are turning out in large quantities, in order that the price will be very much lower than it ever was before. Later on the idea will be to discuss in detail the parts of the several cars, with the idea of showing in what manner they are entitled to the confidence of present and prospective purchasers of the eleventh-year automobiles.

LARGER PNEUMATICS MEAN MORE MILEAGE.

Experienced motorists know that a tire a size larger than that required, according to the "recommended weight" which a tire should support, will carry him from three to five times as far as the tire with which his car would ordinarily be equipped, says the *Rambler Magazine*. There are several reasons for this: The "recommended weight" of the manufacturer is the weight which that tire can carry without overloading it or subjecting it to destructive strain. Any increase over that "recommended weight" means trouble a short ways ahead. It means the same as a steam boiler made to withstand 200 pounds pressure to the square inch being run continuously at a pressure of 250 pounds or more. The result in either case is quick destruction—trouble—expense.

Take for example a 30 by 4 tire. The "recommended weight" is 550 pounds per wheel or 2,200 pounds per car, which is figured to include the normal load which that car should carry. Thus, a 2,200-pound car containing five people weighing 150 pounds each (the normal load) would put every pound of weight on a 30 by 4 tire which it can carry without overstrain. It is then carrying every ounce it should up to the limits of safety. It is a boiler tested to 200 pounds with 200 pounds of steam up.

ADVANCE IN AERONAUTICAL MOTOR BUILDING

By W. F. BRADLEY.

PARIS, Aug. 5.—While it is the automobile that has made aerial navigation possible, the flying machine is seeking to repay its debt by providing us with lightweight motors. Steam as a motive power for flying machines has too many disadvantages to have ever been proposed; electricity has been used, but owing to the excessive weight of storage batteries and dynamo, has never been found really practical, and now that the internal combustion engine has reached such a degree of perfection is no longer a serious rival.

The defect of the automobile engine, the lightest of all power plants available, is its weight. Built for the road or

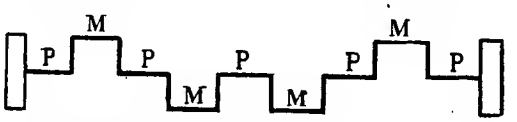

Fig. 1—Arrangement of Four-Throw Crankshaft for Antoinette Eight-Cylinder Engine.

for marine work, a few pounds additional weight were of very little importance; it was only when flying machines began to force their attention upon us that the necessity and possibility of reducing weight were realized.

In France, where more experimental work in connection with aeronautics is being carried on than in any other country in the world, automobile manufacturers have realized the necessity of lightweight engines for flying machines and gliding boats, and in the belief that aerial navigation is destined to become a serious factor, have produced special gasoline engines to meet this demand. It is certain that experimental work in this direction will have its effect on the automobile of the future, and that the engine in general use a few years hence will be considerably lighter for a given horsepower than is generally thought possible to-day.

To reduce weight in an internal combustion engine the best method is to increase the number of cylinders. It may seem paradoxical at first sight, but it is nevertheless true, as is proved by the fact that of the seven or eight types of engine in use for aeronautical work all but one have more than four cylinders. Levavasseur, the designer and builder of the now well-known Antoinette engine, did most of the early experimental work with multiple-cylinder engines, and now stands forth as the most prominent of the small group of engineers building specially for aeronautical work. It was some five or six years ago that Levavasseur, then occupied with aeronautical experiments, sought a lightweight engine on the French market and found none. He designed and built an engine according to his own ideas, attempted to interest the public and the government, was ridiculed by both, and in order to attract attention to his product turned for a time to motor boat racing, where his lightweight engine gained world's records. Now he is back to the air.

The smallest Antoinette engine is made with eight cylinders; the largest with 24, this latter being practically a group of three eights. By adopting eight cylinders as the minimum for aeronautical work, Levavasseur was able to discard the cumbersome and weighty flywheel hitherto considered indispensable on a gasoline engine, and by reason of the more even torque to make a reduction in weight that had not previously been attempted. The abolition of the carbureter, a distinctive feature on the Antoinette, can hardly be considered as an anti-weight device, the pump and direct injection arrangement doubtless being but little less weighty than a specially designed carbureter. In design, therefore, the Antoinette only differs from the engines already used for automobile work by the number of cylinders and the absence of a flywheel. In constructive methods, however, there is a decided difference, every part showing signs of the desire to save weight wherever this could possibly be accomplished.

The eight steel cylinders, with copper water jackets and aluminum heads, are mounted in V on an aluminum crankcase having the form of a triangular prism. Exhaust valves, on the inside of the V, are mechanically operated, while the automatic inlet valves are in the head. It is worthy of note that of all the aeronautical engines of any importance the Antoinette is the only one that is water cooled. Though the air-cooled variety is first in point of numbers, the Antoinette water-cooled type has the position of honor in success achieved, being used by both Henry Farman and Léon Delagrange in all their record-breaking flights. Between the Antoinette and the water-jacketed cylinder familiar to automobilists there is an enormous difference, the former being but a thin steel cylinder bearing a still thinner copper jacket, having all its parts machined to a thousandth part of a millimeter wherever the metal is not necessary for strength. Connecting rods and crankshaft, like the pistons, are of steel, and are bored out to reduce weight. The crankshaft has four throws arranged at an angle of 180 degrees, the two end ones and the two center ones being in the same plane; there are thus two connecting rods to each throw. The shaft has the further advantage of possessing a bearing between each throw. In the matter of lubrication the distinctive feature is the use of a gear-driven pump drawing the oil from the base of the crank chamber and driving it through a copper tube within the upper portion of the crankcase and pierced with numerous holes through which the lubricant is squirted with considerable force onto the moving parts below. To provide for a supply of oil in whatever position the engine may be placed—a state of affairs which must be considered in aeronautics—the crankcase is divided transversely into four compartments. Thus splash and force feed are constantly provided.

The distinctive feature, however, of the Antoinette, apart from the remarkably fine machining which its construction entails, is the absence of a carbureter. Gasoline is drawn from the tank and by means of a gear-driven pump is injected direct into each cylinder. The pump, driven off the camshaft gear, is so constructed that the stroke can be varied at will, thus regulating the amount of fuel sent through to the

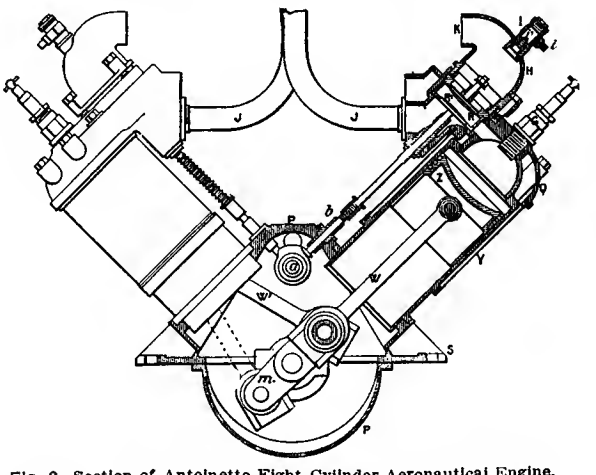

Fig. 2—Section of Antoinette Eight-Cylinder Aeronautical Engine. Z Piston; R Automatic Inlet Valve; R¹ Mechanical Exhaust Valve; K Air Inlet; J Exhaust Manifold; A Camshaft; Y Copper Water Jacket.

Fig. 3—Fifty-Horsepower Eight-Cylinder Antoinette Engine Mounted on Aeroplane to Drive Two-Bladed Propeller as Shown.

cylinders. Each cylinder carries its own distributer regulating the amount of gasoline necessary for each explosion and storing it during the three strokes other than that of aspiration. Levavasseur is of opinion that direct injection is the only possible method of obtaining an even distribution of the charge on a multiple cylinder engine. Ignition presents no distinctive features, storage batteries and single trembler coil generally being employed, but high-tension magneto being fitted where desired.

The eight-cylinder 50-horsepower engine, with a bore and stroke of four inches, weighs complete 154 pounds, the 80-horsepower engine weighs 350 pounds, and the 120-horsepower model scales 440 pounds. The 80 and 120-horsepower models are 16-cylinder engines. Generally for aeroplane work no radiator is used, a small tank being carried on the top of the apparatus and connected with the engine by means of suitable piping. Now, however, that the sky pilots have made progress and can stay aloft for more than a quarter of an hour, a radiator has been designed and fitted to both Farman's and Delagrange's machines. For the eight-cylinder engine the radiator weighs but 20 pounds.

Big Auto Constructors Studying Aero Engines.

Renault is the first of the large European firms of automobile constructors to produce a lightweight aeronautical engine. Excepting that the cylinders are air-cooled, the general arrangement of the engine is similar to that of the Antoinette just described, and consequently has nothing in common with the well-known Renault car engine. All valves are mechanically operated by a single camshaft, the exhaust velves being overhead and operated by rocker arms, and the inlets below. The spark plugs are fitted just over the inlet valves and project into the angle formed by the two rows of cylinders. The carbureter and all ignition wiring is also brought up into this angle, the motor thus having a remarkably clean-cut appearance. Naturally the flywheel has been abolished, and as in the Antoinette there are two connecting rods to each throw of the crankshaft. Only one model of engine has yet been produced, which with a bore of 3.5 inches and a stroke of 4.7 is rated at 45 horsepower at 1,500 revolutions per minute.

Distinctive in the Renault cooling arrangement is the use of two large ventilators, the one at the forward end of the engine drawing in cool air and the one at the rear driving it out after it has passed around all the cylinders. As the engine is covered by a sheet-metal hood, and the fans themselves revolve in a light cage, the current of air is considerable and is declared to be sufficient to keep the engine cool under the most disadvantageous conditions. In principle the ignition and carburation have not been radically changed from those used on the touring cars. Naturally, lighter material is employed wherever possible, but the design is the same. The Bosch magneto is mounted in a reverse position under the forward extension of the crankshaft, the carbureter is carried centrally between the two rows of cylinders and lubrication is assured by a force feed pump similar to that on the cars. Fully complete with carbureter and all ignition apparatus the Renault engine is declared to weigh 310 pounds. No public tests of the Renault engine have yet been made, though one is fitted to a new aeroplane being built by the Voisin Brothers.

New Principles in Aero Engine Design.

Despite the absence of a flywheel and carbureter and the increase in the number of cylinders, the engines described do not materially differ in principle from those employed generally for automobiles. There are a small number of constructors, however, who have sought to decrease weight not by the suppression of a flywheel and the paring of the metal at every possible point, but by entirely new design. Foremost in this school is Robert Esnault-Pelterie, who has produced a seven-cylinder air-cooled engine without flywheel, with but a two-throw crankshaft for the whole seven cylinders and a single cam for all the valves.

Without entering minutely into the genesis of the engine, it is interesting to note that Robert Esnault-Pelterie set out to design a multiple cylinder engine, the cylinders of which, of an even number, would be placed at equal distance around a circular crankcase, the pistons operating a one-throw crankshaft. Theoretically it was impossible with this arrangement to obtain the firing of the cylinders at equal intervals, and practically it was impossible to efficiently lubricate those cylinders having their heads downward. The result was the

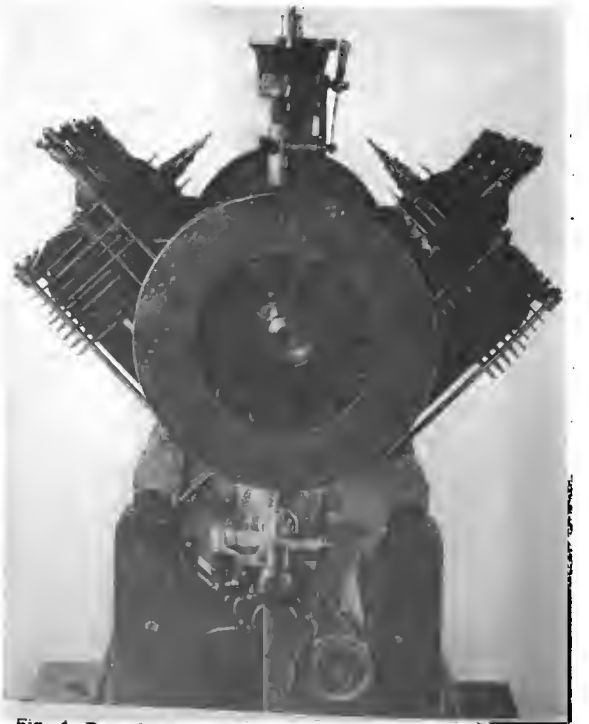

Fig. 4—Renault Eight-Cylinder Air-Cooled Aeronautic

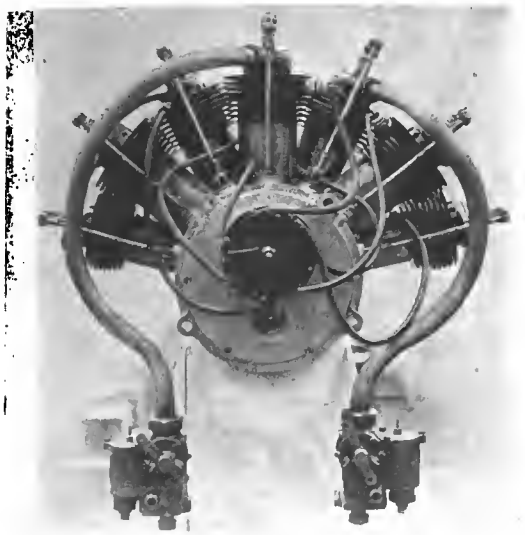

Fig. 5—Esnault-Pelterie Seven-Cylinder Air-Cooled Aeronautical Engine, as Employed by This Inventor on His Aeroplane.

production of a five or seven-cylinder engine the cylinders of which were staggered round the upper half of a circular crankcase, and all connected up to a two-throw crankshaft. By means of this radical departure from standard lines of gasoline engine design, Esnault-Pelterie has been able to obtain an engine developing 35 horsepower on the brake at a speed of 1,500 revolutions per minute, for the extraordinarily low weight of 115 pounds. This weight includes carbureter and all ignition accessories, the motor in fact being in running order. That it is more than a piece of clockwork is proved by the fact that Esnault-Pelterie has used the engine continuously on his own aeroplane and executed several flights in his new machine by means of its aid.

Having an odd number of cylinders and a two-throw crankshaft, it was of course necessary to have more pistons connected up to one of the throws than to the other. On the seven-cylinder engine the two arms of the crankshaft, which by the way only weighs seven pounds, are laid at an angle of 180 degrees, three connecting rods being attached to one and four to the other. The shaft is balanced to counteract the uneven division. The cylinders are really staggered in two series on the crankcase, the four forward ones in a line with pistons connecting up to the forward throw of the shaft, and the three others slightly in the rear connecting up to the other arm.

The cylinders of the Esnault-Pelterie engine, cast separately with cooling flanges on the upper portion, have a bore of 3.3 inches and a stroke of 3.5 inches. They are attached to the one-piece aluminum crankcase with three bolts each having two different threads, so that the slackening of the nut would tend to the tightening of the lock nut. Instead of the wrist pins being attached to the interior walls of the piston, as is the usual practice, the bearing is here screwed into the head of the piston, the steel walls being far too thin to allow of any attachment.

Something New in the Matter of Valves.

Valve design is just as radical a departure from fixed standards as any other portion of the engine, each valve, placed in the head and operated by an overhead rocker arm, fulfilling the functions of both inlet and exhaust. Above the flat face of the valve—the valve is of course reversed, the head being downward—is a cylindrical cage provided with a series of holes and encircled by a steel collar. On the full opening of the valve aspiration takes place in the usual way, the exhaust openings from the cage to the outside being closed by the collar. On compression and firing strokes the valve operates also in the usual manner, but on the exhaust stroke the collar closes all connection with the intake pipes, the valves slightly leaves its seat and the spent gases are evacuated through the opening in the cage left free by the position of the collar, showing that the inventor has departed entirely from the usual method of valve operation. There are thus three positions for the

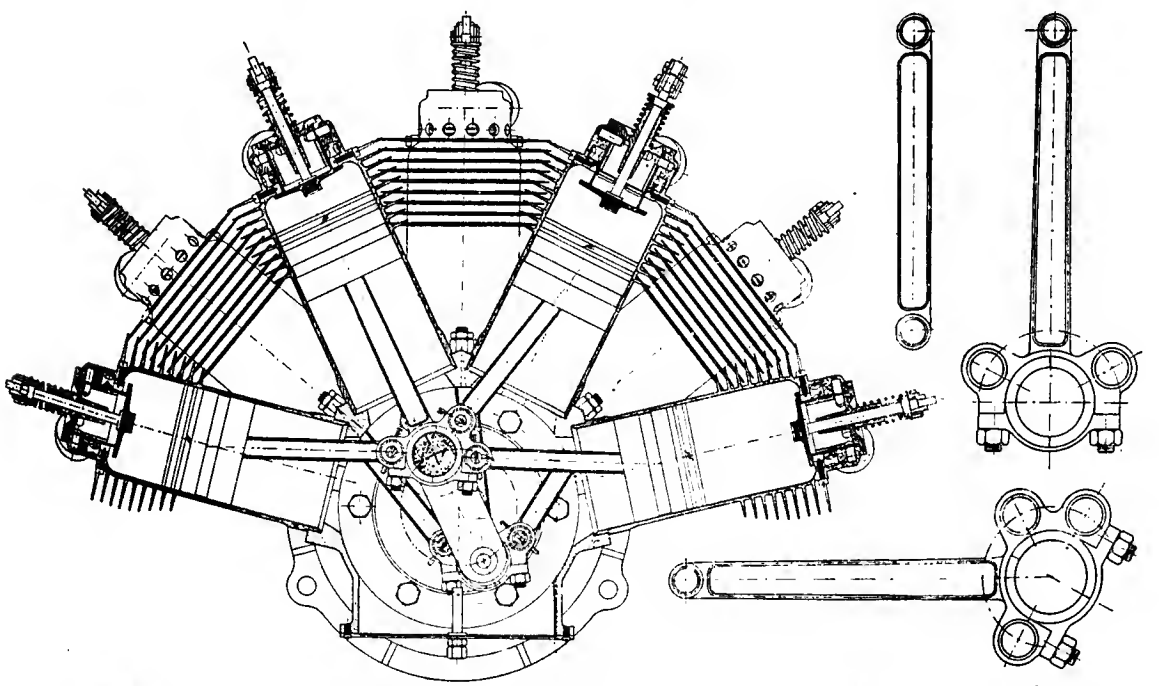

Fig. 6—Cross Section of Seven-Cylinder Esnault-Pelterie Aeronautical Engine, also Showing the Connecting Rods.

Fig. 7—Combined Inlet and Exhaust Valve as Used on Esnault-Pelterie Seven-Cylinder Aeronautical Engine.

valve; closed, fully open for the intake, and partially open for the exhaust. Though at first sight complicated, the valve mechanism is in reality exceedingly simple, for it practically abolishes one valve with all its attendant mechanism and solves the hitherto difficult problem of cooling the exhaust valve on an air-cooled engine by reason of the passage of the cold current of explosive mixture around the valve at a speed which, translated into miles, often exceeds 180 an hour.

In reality one double cam operates all seven valves. Had it been possible to place the cylinders in one line a single cam would have been sufficient; owing, however, to the second set of cylinders being slightly to the rear of the first group, the cam, driven off the crankshaft and turning in the contrary direction to the engine, has to be double faced, each face having three large bosses for the inlet and three smaller ones for the exhaust.

Two carbureters are provided for each engine, one feeding two front and two rear cylinders and the other supplying gas to the remaining three. There is little that is distinctive about the ignition, current being supplied by a storage battery and distribution taking place through a commutator placed outside and to the rear of the engine—the side opposite to the propeller—in order to keep it free from oil.

Lubrication is entirely by splash with the difference that in order to prevent an uneven suction of oil into the more oblique cylinders on the lower part of the circular crankcase, the base of each cylinder is covered with a mask provided with an opening for the passage of the connecting rod. This opening increases in size in proportion as the cylinders approach the vertical. Naturally the splash is greater on the inclined cylinders, but as the opening here is smaller the amount of oil allowed to enter is not any greater than that drawn into the central vertical cylinder.

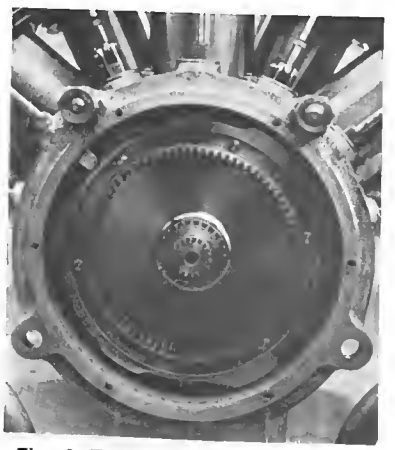

Fig. 8—Esnault-Pelterie Seven-Cylinder Aero Engine. Forward End of Crankcase Is Removed, Showing the Single, Double-Faced Cam Operating all Valves.

Several attempts have been made to produce an engine with an even number of cylinders placed at equal distances around a circular crankcase, but none appear to have progressed beyond the testing room. Burlat, following up the four-cylinder revolving motor exhibited a year ago at the shows, has produced an eight-cylinder engine of a similar type, and Farcot has among his many inventions an engine with eight air-cooled cylinders fixed at equal distances around a circular crankcase. Doubtless it would be possible to unearth scores of other attempts to solve the problem of high power with light weight. For the present, however, it is sufficient to leave the inventors to their task; when they have succeeded in producing an engine that will meet the exacting requirements of the knights of the air, who, it is hardly necessary to mention, are much more exacting than the most critical automobilists, it will be time enough to call attention to their products.

"RÉPUBLIQUE" ACCEPTED BY FRANCE.

Paris, Aug. 8.—After being tested in every possible manner, *République*, the dirigible airship built by the Lebaudy brothers, has been handed over to the military authorities of France and is henceforth the chief aerial fighting force of the nation. The official flight took place at Moisson, 30 miles from Paris, under the control of Engineer Julliot, designer of the *République*. The slight defects that had been revealed in the preliminary trials had all been remedied, with the result that ballast was perfect and the slight roll of a fortnight ago had disappeared. When the military crew has been sufficiently trained by short journeys around Moisson the airship will be brought to the Chalais-Meudon station in the suburbs of Paris, to leave later for its permanent station on the Eastern frontier.

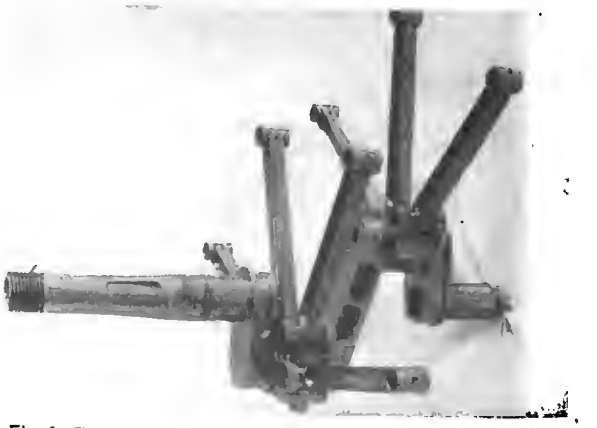

Fig. 9—Two-throw Crankshaft of Esnault-Pelterie Seven-Cylinder Aeronautical Engine.

Louis Bleriot's success with the monoplane type of flying machine has not been of long duration. After proving conclusively that the single plane type was superior to the biplane, as used by Farman, the champion of the former system recently made a number of successful flights of moderate length on the Issy-les-Moulineaux ground, only to fall a victim to contrary currents. While attempting to make a turn the machine was caught in one of the swirls which are so much feared by Farman, suddenly dived down from a height of 100 feet, swung over to the left until the tip of the wing touched the ground, pivoted and flopped to the ground. Though all the forward end of the apparatus was broken and the left wing suffered seriously, Bleriot escaped without a scratch and was sitting upright in his seat when the assistants rushed to his rescue.

Leon Delagrange, who returned from his Italian tour the day Farman sailed for New York, declares that he will now commence experiments with the monoplane type of flying machine, the biplane having proved itself excellent in calm weather, but very unreliable in a wind and dangerous in whirling currents.

At a dinner given to M. Farman, before his departure for America, to celebrate his winning the Armengaud prize for a quarter of an hour flight, a new prize was offered by M. Deutsch. The sum is 25,000 francs, and the conditions are that the successful competitor must carry Commandant Renard, of road-train fame, across the English Channel.

LETTERS INTERESTING AND INSTRUCTIVE

WHY MORE SPEED WITH LESS ENGINE?

Editor THE AUTOMOBILE:

[1,499.]—I have been greatly interested in following the various transitions through which French racing rules have gone in the past few years, and would like to have a query concerning them answered through the column of "Letters Interesting and Instructive." I understand that the unlimited bore plan of last year—in other words, the fuel consumption restriction, was done away with, principally because it placed no restriction whatever upon the speed of the car. But from the accounts of this year's Grand Prix race which appeared in "The Automobile" at the time, I learn that the speeds averaged by the different competitors, under this year's limited bore rule, were greatly in excess of those attained last year, while some of the single lap records were so very much faster as to make it apparent that some new restriction must be adopted next year—if there is to be a next where the Grand Prix is concerned—in order to keep speeds within a limit that tires may reasonably be expected to endure on such road courses as are now employed for the big international events. What I would like to learn is, How did the designers succeed in getting so much more speed out of their cars where they had to conform to a limited bore restriction, as compared with the cars of the year previous in which there was no limit to the size of the motor. I know that a great many things are possible with the automobile motor, but have not been able to explain this satisfactorily.

Allentown, Pa. EFFICIENCY.

It is a matter of common knowledge that a horsepower may be produced by the use of less than 10 pounds of metal in a motor, and, on the other hand, that it is quite possible to use 200 pounds, 300 pounds, or any quantity of iron, to achieve the same result. For instance, the average stationary motor of small size weighs anywhere from 100 to 250 pounds per horsepower, a 5 or 6-horsepower engine weighing more than half as much as a complete 30-horsepower automobile in running order. It is principally a matter of piston speeds and compression, and this accounts in large measure for the difference in the speed of the racing cars of the two years. Again, it is one thing to design a motor that will show the maximum economy, and quite another to produce one that will show the greatest output for its dimensions and weight, regardless of any consideration of fuel consumption for the power delivered. Every motor has what may most aptly be termed its "critical speed." In other words, its rate of delivering work at which it is most economical in fuel per horsepower, and in order to achieve the latter end, it must be run at that speed. Hence, it cannot be said that this year's cars were faster than those of the year previous, because the latter were not run so much for speed as they were for economy. It would not have availed one of the competing drivers much to have beaten all his competitors by even half an hour's time, if he were stranded so much as a hundred yards away from the finish on the final round through lack of fuel, as his victory would have counted for nothing. The rules made the winner the first car to finish the distance on its fuel allowance, and the fact that many of them were unable to do so was probably due to their reckless use of fuel, as it is well known that a motor is very extravagant at extremely high speeds, owing to the amount that is wasted. Practice runs before the 1907 Grand Prix were mainly to find out just how far a car could run on the allowance granted by the committee, and just what speed it had to be run at in order to cover the distance. Many of the drivers learned both well in advance, so it is quite reasonable to suppose that in few cases were the cars let out to their possible speed at any time in the race, as that would have meant defeat in the last lap through lack of gasoline. Some combination of restrictions, such as the size of the motor and the amount of fuel, would appear to be the only logical method of bringing the possible speed down, and it is quite probable that future racing regulations abroad may take some such form as this within the next year or two, if not for next year's Grand Prix, should it be held in 1909.

BUY ONLY FROM A RESPONSIBLE MAKER.

Editor THE AUTOMOBILE:

[1,500.]—I do not recall having seen in your paper any warning to would-be purchasers of machines relative to their selecting a machine the manufacturer of which not only furnishes duplicate parts at reasonable prices, but who exercises the same care in filling orders promptly and well as they do in soliciting purchasers of the machine. About three weeks ago I sent to one of the best known manufacturers in this country the price of a float valve and stem for a carbureter. A week later I received the valve. I addressed another letter to them and at the end of another week received the float. I am writing them to-day in regard to the stem.

Further, I have observed that many young men, especially in small towns, are enticed into buying a machine by the big discount offered to agents. Aside from the fact that some of the concerns offering these large discounts frequently go out of business, any purchaser of a type of machine, the construction of which is new to his community, is more or less handicapped, and should the manufacturer go out of business, he is up against it for duplicate parts. It is well known that automobile repair establishments in small towns usually represent certain machines, and in many instances they do not take the interest in repairing other makes that they should. Would it not be well then that every one desiring to buy a machine should inquire of his friends their experience in getting supplies from the manufacturer of the machine which he has in view? R. F. HARGRAVES.

Port Norfolk, Va.

The point that you call attention to in your letter has been constantly harped upon for the past two or three years in these columns whenever the question of buying a car has been at issue, and the experience of those who have invested in any of the numerous makes that have sprung up and disappeared within the last three or four years have had this brought home to them very forcibly. This, however, has no direct bearing on the unfortunate experience that you detail in your letter with regard to obtaining a small replacement part, in view of what you say in regard to the standing of the firm in question, and it is to be hoped that such experiences are not common. There has been a great deal of progress made in the past two years in the matter, not only of supplying replacement parts, but of doing so at reasonable prices, and there seems to be no doubt that as time goes on this will finally be brought down to a basis where it is on the same plane with that of any other business.

SOME QUERIES ON A NUMBER OF SUBJECTS.

Editor THE AUTOMOBILE:

[1,501.]—I would like to ask a few questions:

1. The advantages and disadvantages of a three-cylinder, four-cycle gas engine.

2. If in a two-cycle engine there is just as much compression in pounds in the crankcase as in the cylinder at the joint time of compression.

3. Take a racing machine, about how many r.p.m. does the engine go when the car is traveling at 60 miles per hour?

4. The duties of a mechanician on a racing machine.

Warren, Mass. LOWELL S. ELLIS.

1. The three-cylinder motor of the four-cycle type is much more difficult to balance so far as its power impulses are concerned, than the four-cylinder motor of the same type, which accounts for its rare use on the automobile. That is, whether the crankpins are placed 120 degrees apart round the circle, or two of them are in the same plane with the third at 180 degrees, the order of firing is irregular, and though well-balanced mechanically, in the case of the 120-degree arrangement, its impulse balance is poor in either case. Although largely employed for stationary work, as well as to some extent in marine practice, we could never see that the three-cylinder motor had any particular advantages on the automobile. However, there are authorities who are of the contrary opinion, and if they wish to do so, they may come

forward in these columns in support of their side of the question, as it may be of interest to readers generally.

2. This question is rather ambiguous, but we presume you mean by "at the joint time of compression," the moment that the charge is transferred from the crankcase to the combustion chamber, because when the piston is compressing, a fresh charge is being drawn into the crankcase. If this be correct, it is evident that the answer to your question must be "No." With the same degree of compression on either side of the transfer port, i. e., in the combustion chamber and in the crankcase, there could be no movement of the charge. As it is, the fresh charge is under a compression of anywhere from 3 to 8 pounds, according to the design of the motor, while in the combustion chamber it is very slightly above atmospheric, thus permitting the inflow of the supply of fuel from the crankcase. The amount of pressure in the latter, the size of the ports and the like, are all calculated to permit of as quick a transfer as possible, as the port is only open for a very small fraction of a second.

3. This naturally depends upon whether it is equipped with a high or a low-speed motor and what its gear ratio happens to be, so that it would be impossible to even approximately answer the question for this particular speed without knowing something more about the car. In general, however, it might be placed at anywhere from 1,200 to 1,500 r.p.m., but as many of the cars in important road races average speeds as high or better than this for the whole distance, and go as fas as 90 to 95 miles on straight stretches, it is evident that their motors are capable of running much faster.

4. While running, the chief duties of the mechanic are to watch the oil, and a special hand pump by means of which extra oil can be injected directly into the crankcase is usually provided. He also watches any other adjustments that can be made while under way, and when stopped for repairs or tires, assists the driver in making these, the rules under which most recent contests have been run providing that only the driver and his mechanic can attend to such things and that outside assistance will be sufficient to disqualify the car.

MORE ABOUT THE COAL-BURNING STEAMER.

Editor THE AUTOMOBILE:

[1,502.]—A good many people interested in automobiles know of my efforts to bring out a steel-tired steam auto with no differential and burning coal. I took the auto out lsst wsek and ran it about town. All went fine sxcept the fire. I had 90 pounds of nut coal in ths fire-box and it was impossibls to consume all the steam. Our villags is vsry hilly, and going down hill with steam shut off ths gauge would gain 110 pounds in one minute. I went up a 15 per cent. grade with nine men in the car and the brakes on slightly. It turned corners perfectly, proving that a differential is not necessary with steel tires. I am now putting in a kerosens burner and a steam pump, so I can get water in the boiler with the auto standing still. I would like to know whether a mixture of gasoline and kerosene would be better than pure kerosene, and, if so, in what proportions. By the way, I got up 15 pounds pressure in 9 1-2 minutes with kindling wood, befors I put on coal.

Oneonta, N. Y. M. W. HAZELTON.

We cannot advise you about the gasoline-kerosene mixture from personal experience, but if you get a burner specially made for kerosene it would probably be best to stick to that fuel. In any case, the proper proportions of a mixture could only be determined by experiment in each individual car. But what is the matter with coal? As you have succeeded with it so far, it would seem that a little ingenuity would enable you to fix up some sort of a fire-controller to prevent such wasteful generation of steam.

BOOKS ON MOTOR CONSTRUCTION AND DESIGN.

Editor THE AUTOMOBILE:

[1,503.]—Will you pleass let me know if there is anything published that covers the subject of ths construction of gasolins motors, mors particularly ths setting or adjusting of the valves.

Somerville, Mass. G. P. BIAGIOTTI.

There seems to be a lack of works of a technical nature on the subject of the design and construction of the automobile motor so that it is impossible to refer you to any single work from which you can obtain the information you are in search of. "Elements of Gas Engine Design," by Sanford A. Moss, M.S. Ph.D., and Roberts "Gas Engine Handbook," may give you what you want, although the latter is not only old, but is devoted to stationary practice. "The Automobile Pocketbook," by E. W. Roberts, M.E., may come closer to the requirements, though but a small part of it is devoted to the motor. Other works are "The Gas Engine," by F. R. Hutton, M.E. Ph.D., and "Gas, Gasoline and Oil Engines," Gardner D. Hiscox, M.E., but neither of these falls within the requirements as set forth by your inquiry.

WANTED: A DEFINITION OF "INERTIA."

Editor THE AUTOMOBILE:

[1,504.]—Please give me in your "Letters Interesting and Instructive" a good dsfinition of the word inertia. A number of auto cranks, myself included, lately got into an argument relative to the proper meaning of this word. I gavs a definition as follows: Inertia is ths resistance that a body offers against s change in its position. Anything from your columns will be greatly appreciated. R. G. McCREIGHT.

Camden, S. C.

Inertia is that property of a body by which it tends to continue in the state of rest or motion in which it may be placed, until acted upon by some force. As used by the non-technical, it is almost universally employed in the former sense, i. e., that of the resistance which a body offers against a change in its position, an inert body usually being intended, so that your definition is perfectly correct so far as it goes. The popular impression is that only inert bodies have inertia, it being likewise generally thought that a moving body is possessed of momentum alone, whereas an object at rest is possessed of inertia, and the same object in movement has both momentum and inertia.

INFORMATION WANTED ON COMPLETE GEARS.

Editor THE AUTOMOBILE:

[1,505.]—Could you direct ms to any one company that furnishes running gears, complets, minus tires? That is, everything necessary for the chassis of an automobile, but not in their sssembled state, ths parts to bs put together by the buyer.

Louisville, Ky. H. E. HARRYMAN.

You will find several advertisers of such materials in our columns, to whom we can recommend you. Vast quantities of motors and parts are now being turned out by independent manufacturers, and the components of a complete car may now be purchased from a jobbing house or from a number of different makers, each one supplying his own specialty.

A RECOMMENDATION FOR DECARBONIZER

Editor THE AUTOMOBILE:

[1,506.]—With pleasure I write that I have been using the Radium Decarbonizer on a Frayer-Miller 24-horsepower car (air-cooled) for the last ten months as per direction, which is very simple, with perfect satisfaction. It has been now fifteen months since I had the cylinders scraped of carbon and I used the car for thirteen months before I had tbe valves ground. I have been running this car now for four years, winter and summer, in my professional work, besides taking extended tours with my family during my yearly vacations, and I must say that ths car is running perfectly fine with the above treatment. I have no trouble of overheating or pre-ignition.

Erie, Pa. P. T. JOHNSON, M.D.

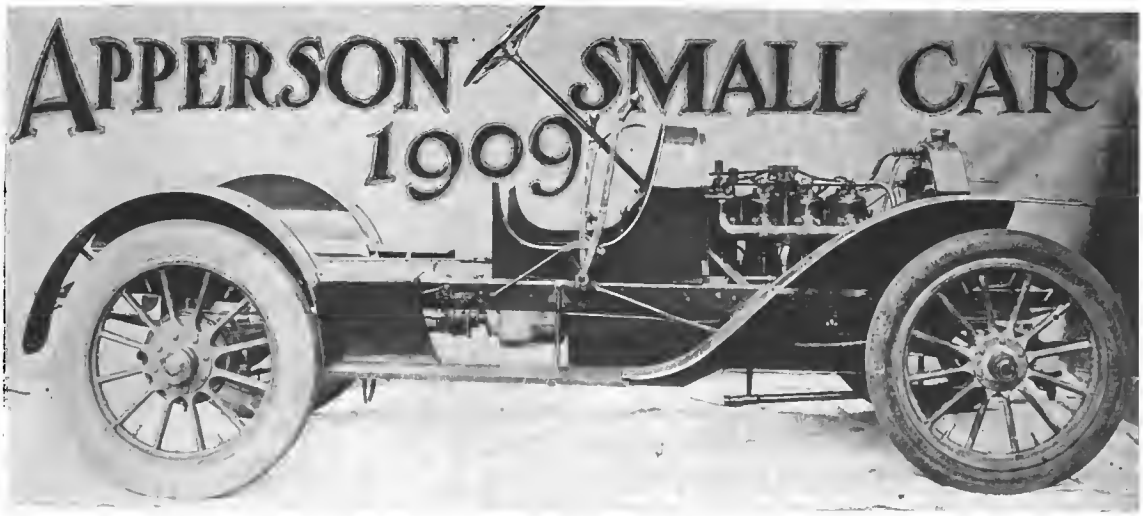
AN EXPERIENCE WITH DECARBONIZER.

Editor THE AUTOMOBILE:

[1,507.]—In answer to Mr. Stark's question (1,497) regarding Decarbonizer. I have used it and several of my friends havs used it this year and so far results have bsen all claimed for it by the manufacturers. Several of my friends and myself used a certain brand of oil and in a few weeks all had carbon galore. Whether it was the fault of the oil, or ourselves, I do not know, but I do know I nevcr had troubls with any other oil carbonizing. The Decarbonizer worked fine and so far there is no indication of injury to the cylinders or pistons.

Duluth, Minn. F. C. LEE, D.D.

APPERSON SMALL CAR 1909

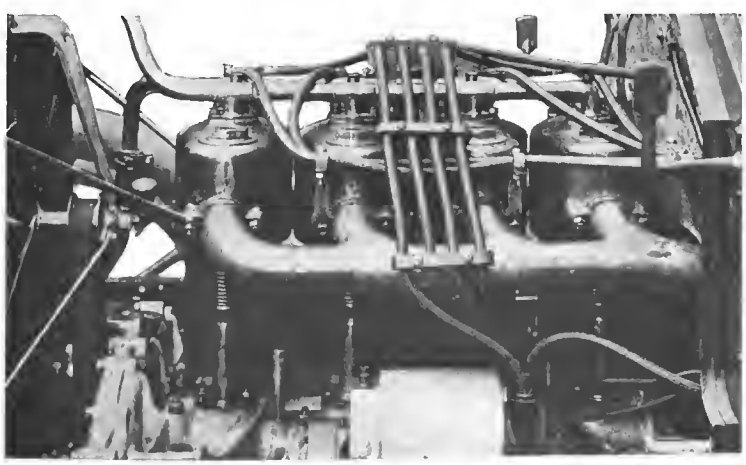


THERE are not many firms in this country, nor for that matter abroad, who can look back upon 16 consecutive years of automobile manufacturing, and for that reason the sixteenth annual announcement of the Apperson Brothers Automobile Company is of more than the usual interest. Its purpose is to present an entirely new car of the medium-powered type to sell at a low price, and is coupled with the statement that the company has largely increased its manufacturing facilities and is planning to turn out 2,000 cars during the coming year. While "Model O," which is the official designation of the newcomer, is a new production and in a field that the Apperson Brothers Company has not entered hitherto, it takes but a glance at the specifications and the photographs of the car to reveal the fact that it is almost an absolute replica of the standard Apperson cars of higher power, on a slightly smaller scale.

Characterized Throughout by Apperson Features.

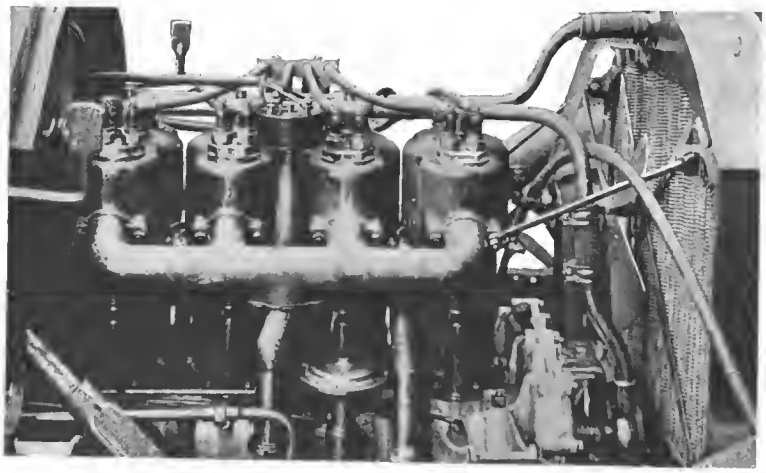
This is at once evident upon making an inspection of the motor, which is constructed with the independent cylinder castings and oppositely disposed valves in outboard ports that have always distinguished the Apperson motor. The valve lifters and cages are of a specially designed type made with a view to reducing the noise, and for their enduring qualities. The half-time shafts operating the valves are enclosed in the crankcase, and either can be withdrawn at the end of the motor without interfering with the adjustment of any of the other working parts. In order to be able to compensate for wear, the valve lifters are provided with a device which permits of adjusting their length to suit that of the valve stem.

While the motor appears to be an absolute copy of the larger Apperson engines, it is not merely a reproduction of the latter, but has been specially designed for the purpose, the valve ports, compression, exhaust clearance, timing and other matters pertaining to the production of an efficient high-speed motor having been carefully worked out in the design. The motor normally develops 28 to 32 horsepower, but has shown as high as 38 horsepower on the brake. Its rating under the A.L.A.M. formula is 30.4 horsepower. Every part has been carefully jigged in the factory, making them all interchangeable for replacements or repairs. The carbureter is of the type made in the home factory and employed on the Apperson product, while a mechanically operated, force-feed type of lubricator is fitted to take care of this essential, oil being delivered directly to the bearings. For ignition, the standard equipment will consist of a set of accumulators and a four-unit coil, a dual ignition system with independent plugs served by a high-tension magneto being catalogued as an extra. A fin tubular radiator of the vertical pattern, such as has characterized Apperson cars for some time past, is employed, its head-on outline having been altered somewhat by the adoption of an extension to meet the forward end of the dust pan extending under the engine and which serves to keep the working parts of the motor and transmission free from road dirt and grit. A fan flywheel of the latest type has been adopted on the motor and tests, as well as service try-outs, have shown that this aids materially in the cooling of the motor. In this and many ways, the painstaking attention that has been paid to every detail of the design of the new Apperson small car are apparent.



Showing the Situation of the Magneto and Wiring on the Apperson 1909 Small Car.

The contracting band type of clutch which has always been an Apperson feature, has been perpetuated in this new small car of the same make, consisting of a cast steel brake band contracting on a circular bronze drum. In fact, this Apperson clutch has been in use ever since 1895 without any change whatever, and certainly this length of time in service is sufficient to substantiate the makers' claim



Two Spark Plugs Are Carried Over Each Intake Valve.

that it is one of the most reliable types of clutch ever put on an automobile. The gear-set is what is familiarly known as the selective type, giving three forward speeds and reverse and controlled by the usual single side lever. Particular attention is called to the fact that the gear-set housing is all one piece, consisting of a single aluminum casting, and what is far more important, that the change speed gears and shafting can be lifted out intact without any further preliminaries than the removal of the cover of the case, it not being necessary to touch a bolt or nut aside from this. In fact, there is not a nut or bolt in the interior of the housing, so there is nothing whatever to work loose and cause trouble.

The design of this gear-set has been thoroughly worked out from years of actual experience, and the makers are of the opinion that it more closely approaches the distinction of being "fool-proof" than any other on the market. The gears are made from the best grade of Krupp chrome-nickel steel, which is generally conceded to be the best possible for the purpose, while the shafts are supported on the latest pattern of New Departure ball-bearings. The latter are specially designed to take both thrust and radial loads and are fitted with two rows of balls, instead of one, as is usual.

So far as the description goes, it will be noted that the car has the hall-mark of the Apperson factory stamped all over it, in that, with few exceptions in the shape of detailed refinements here and there, which are to be looked for in every new production, it exactly follows those lines that have always distinguished Apperson motor design and construction. It is in the final drive by propeller shaft that the most radical and probably the only divergence of importance from what have come to be Apperson standards has been made, this firm having always been strong and persistent advocates of the double chain drive. So far as their regular models of higher power are concerned, this is still adhered to, the adoption of the shaft drive on the smaller merely being a recognition of the fact that it is better adapted to the car of medium power and speed. The universal joints employed on this shaft drive are of the very latest type and are protected by oil and dust-proof housings. When carrying its normal load, the motor, gear-set and rear axle are practically in the same horizontal plane. The standard gear ratio employed is 3 to 1.

Some of the Chassis Specifications.

Following standard practice, the frame is of the usual pressed steel, channel section construction amply reinforced, and is carried on semi-elliptic springs front and rear, the former measuring 40 inches in length and the latter 50 inches. The springs are attached with a view to preventing breakage under the most strenuous conditions of service. The steering gear is of the usual worm and segment type that is entirely proof against movement from road shocks, while the brakes are of the internal expanding and external contracting types placed in hubs on the rear wheels. The former constitute the emergency brake, operated by hand lever, while the latter are employed as the service brakes. The forward axle is a one-piece drop-forging of Vanadium steel and of I-beam section. The spring saddles are forged integral with it, while the steering heads are carried on ball-bearings. For the rear axle equipment, what is commonly known as a floating type has been adopted, but it has been specially designed so that the driving wheels stand on "plumb spokes," a feature to be found in but very few cars. This prevents spreading of the wheels and makes a much easier running and faster car. Thirty-four by 4-inch wheels are used, the wheelbase being 110 inches. With a three or four-passenger body, the new Apperson Model O, lists at $2,250, and $2,400 with a five-passenger touring body. Deliveries are already being made of this newcomer to the Apperson fold.

The "Jack-Rabbit," Model K, 50-55 horsepower, seven-passenger touring car and three-passenger runabout; the Model I, 40-45-horsepower, seven-passenger touring car; the Model M, 35-40-horsepower car, with three, four or five-passenger bodies, and the Apperson 50-55-horsepower, six-cylinder, seven-passenger touring car, will all be continued, so that in designing this latest addition to the Apperson line, it has been the chief object of the manufacturers to extend their price range in order to be able to participate in the large and increasing demand that is daily making itself felt for the well-built car of medium price and power.

Rear View, Showing Ball Bearing Floating Axle.

MAKING A 4,000 FOOT CLIMB.

What appears to be a record demonstration run was made June 27 by Edwin G. Woolley, Jr., in a 1908 Rambler roadster, who covered 36 miles from Salt Lake City to the top of Parley's Canyon Divide, over a 4,000-foot grade. Three passengers were carried and the route was through occasional stretches of sand and three miles of rutty clay road. For the first twelve miles the car ran on high gear, and the remaining distance was covered on the intermediate, the low gear not being used at all. Gasoline consumption for the entire trip was reported not to exceed three gallons. The roadster which made this climb has now covered 1,054 miles without having made a miss.

Edwin G. Woolley, Jr., Making Record 4,000 Climb in Rambler Roadster.

The mountain ranges to the east of Salt Lake City present grades that are extremely difficult to surmount. The altitude of Salt Lake City itself is over 5,000 feet above the level of the sea and the mountains of Utah tower above the city from 4,000 to 6,000 feet more. The divide mentioned above is one of the altitudes that separates the waterflow, the streams on the west side flowing into the Great Salt Lake and those on the east finding their outlet in the Colorado river. The Wasatch range which constitutes the divide, runs north and south through central Utah. The Uintah range from east to west connects at Strawberry valley.

Arthur C. Hull in Cadillac Runabout on Twin Peaks.

UP SAN FRANCISCO'S HILLS.

Twin Peaks, the highest altitude on the peninsula on which San Francisco is built, form a background to one of the leading thoroughfares of the City of the Golden Gate, and are 900 feet high. Some idea of the grade percentage may be obtained from the photograph in which Arthur C. Hull, of that city, is depicted climbing one of the peaks in a Cadillac runabout. Pacific Heights next approach in altitude the Twin Peaks, but are somewhat lower, while Nob Hill, which contains the palatial residences of the California money kings, is about 300 feet high and well adapted for habitation.

The streets north and west of Market street strike boldly at the hills and have gradients of 50 per cent., and this feature is what gives San Francisco its imposing sky line when viewed from the bay, as the houses have the appearance of being piled on top of one another. The points of vantage on the hills present scenes of great beauty, embracing the broad Pacific on the west, San Francisco bay and its islands on the east, and the active commerce and densely populated districts of the city with distant mountains as a background.

IN THE WONDERFUL PARKS OF LOS ANGELES.

In no spot in the world is the benefit of irrigation more apparent than at Los Angeles, Cal. The city, its surrounding parks and contiguous territory, is a veritable paradise of vegetation, semi-tropical in its nature, while vast stretches of country immediately encompassing, that are as yet un irrigated, have the appearance of a desert.

Los Angeles was settled by the Spaniards as Pueblo de Nuestra Señora La Reina de los Angeles (City of Our Lady the Queen of the Angels) in 1781, and until 1847 alternated with Monterey as the seat of the Mexican Government in California. It was captured from the Mexicans after some resistance in 1846 by General Stockton. The city is the possessor of 3,700 acres of magnificent parks and botanical gardens known as Elysian, Westlake, Eastlake, Hollenbeck, Griffiths, Central and Plaza parks.

W. M. Hill's Winton (Which Has Traveled 38,000 Miles) in Elysian Park, Los Angeles.

ILLUSTRATING THE AUTOMOBILE'S GROWTH.

Indianapolis, Ind.—The last of the picturesque stages that have traveled over Indiana roads since pioneer days are disappearing, and within a few months it is likely not one will be left. The automobile has supplanted them gradually during the last two years. Although Indiana prides itself on its rapid development, there are two counties untouched by railroads, while a third county has only one railroad touching one corner.

Within the last two months a number of new companies have been organized for the purpose of operating automobile lines, and all are meeting with success. Last week the Greensburg, Napoleon, and Osgood Rapid Transit Company was organized, with $5,000 capital, and will operate an automobile line between those points, with headquarters at Napoleon. A twelve-passenger Rapid 'bus has been purchased.

George Straub, of Corydon, who has owned the horse-drawn stage between Corydon and New Albany for years, has decided that an automobile would be more profitable. He is organizing a company, and an automobile 'bus will be purchased soon.

The Connersville Motor Transit Company has made a success of an effort to use automobiles in place of street cars in that city. Two twelve-passenger cars make regular trips to different parts of the city and to the suburbs, with a five-cent fare.

Recently the Richmond Transportation Company was organized at Richmond, and has been operating a twelve-passenger car between that city and Reid Memorial Hospital, touching a large residence section not reached by city street cars. So far as known, this experiment has been the only unsuccessful one in Indiana, and the company is not ready to quit, believing the plan is practicable. It was found that the car in service did not have sufficient power to climb the hills, and a new one is to be purchased.

Temple, Tex.—Another addition to the rapidly increasing list of automobile stage lines was made last week when two 22-horsepower cars were put in operation between this city and Marlin. Although the two places are but 35 miles apart, the round trip by railroad requires a day and a half. Some agitation for an interurban electric line which had been made attracted the attention of J. F. Robinson, of San Antonio, and as the result of his investigations he decided to establish the stage. The route will include the villages of Oenaville, Blevins, Belfalls, Chilton and Mooreville.

Dallas, Tex.—A regular automobile stage service was instituted July 22 by the Dallas Motor Car and Transit Company between Sanger's Corner and East Dallas. Two large cars of the sight-seeing type are in use, and it is expected to make the trip in 20 minutes when Ross avenue is finished. At present the cars have to take to the side streets in places, and the schedule cannot be maintained. Cars leave at each end every twenty minutes from 6 A.M till 12 midnight. J. A. Bergfeld is president of the company, which has its shops at Monarch and Garrett avenues.

Washington, D. C.—The Post Office Department has received the five electric mail wagons for which it contracted recently and will put them into commission immediately, supplanting the present horse and wagon collection system. They will be supplemented August 15 by two more cars provided and run by letter carriers, an allowance for this purpose having been made. When all are in operation eight men and twelve horses will be saved in the city mail collection service.

New York Times:—In this "horseless age" the sprinkling of streets with water is going out of fashion. Thirty-three miles of Boston's thoroughfares are now either under oil, calcium chloride, or "tarve," a mixture much used on suburban highways. In New York top dressings of oil have been tried successfully in the parks. To the automobile's propensity of stripping the highway of its surface covering we shall owe the abolition of street dust altogether, and this will certainly be one of the greatest boons it can confer.

Salvationists Adopt Auto.—The founder and leader of the Salvation Army, General Booth, began his summer campaign in Dundee, Scotland. From that city he journeyed southward, preaching in Perth, Newburgh and Tayport. This year he is making use of an automobile, painted white, with "Salvation Army" on each side in gilt letters. Whenever the General desires to preach—whether it be on the country highway, or on the common of a town—the car stops and an adjutant unfurls a huge green umbrella. Drums and fifes then proclaim that the Army will hold a meeting.

Minneapolis, Minn.—The latest addition to the equipment of the Minneapolis Fire Department is a Wolfe touring car, which has been purchased for the use of Chief J. R. Canterbury. The car is made in Minneapolis, and is now in daily service as the chief's wagon. It is stationed at the city hall, and has been first on the ground at so many fires recently that the members of downtown companies are asking for motor engines and carts.

Baltimore, Md.—The Baltimore Taxicab Company was recently incorporated under the laws of Delaware with a capital stock of $150,000. The incorporators are George W. Knapp, Charles E. Ford, W. S. Belding, N. B. Loeb, Wilson J. Carroll, all of this city, and Charles Berg, of Philadelphia. The company will operate ten cars of 20 horsepower beginning next month. E. H. Clarke will manage the business.

Ogden, Utah.—In a few days several large sightseeing automobiles will be put in service from the mouth of the Ogden canyon up as far as the Oaks for the benefit of canyon visitors. The company which will operate the line has been incorporated as the Ogden Canyon Automobile Company; J. S. Corlow is president; Albert Scowcroft, vice-president, and Joe Decker, secretary and treasurer.

Bunceton, Mo.—An automobile stage service may soon be established between this town and Boonville and Tipton. Mayor O. H. Cramer and one or two others have been working quietly to this end, and have received much encouragement. A single 16-passenger car will be purchased to start with, and if the demand is sufficient another may be added.

Council Bluffs, Ia.—Plans are under consideration for the establishment of an auto bus line between this city and the Iowa School for the Deaf. A car will be run from the corner of Pearl street and Broadway every hour. Other lines may be started later. Among those interested in the project are H. F. Knudson, J. R. McPherson and Henry Sperling.

Louisville, Ky.—The police department of this city has just acquired two automobile wagons, and a 45-horsepower car has been purchased for Millmore Tyson, chief of the fire department. The chief's auto has a large box on behind to carry his fire togs and is equipped with a powerful searchlight.

Clarkston, Wash.—Clarkston now boasts a passenger automobile which runs between here and Lewiston. J. W. Horton and Scott Cowan are the owners and expect to have the machine make regular trips every half hour. If well patronized they will add another in the fall.

Kansas City, Mo.—This city may see its first taxicabs in service before the first of next year. Several local men of prominence are said to have organized a company to introduce them here; twenty-five will probably be ordered to start with, similar to those now in use in New York and other Eastern cities.

Washington, D. C.—The District of Columbia Water Department has added to its already very complete equipment a 3,000-pound Franklin truck, to be used as an emergency car. This latest acquisition has a speed of approximately 20 miles an hour and was constructed especially to meet the requirements of the work.

Jacksonville, Fla.—An automobile line has been established between Bartow and Mulberry and is a money-making proposition, as it is hauling a great many passengers.

Evansville, Ind.—Charles Sibley, of New Harmony, has plans under way for the establishment of an automobile line from that town to Mount Vernon.

DETROIT TO NEW YORK IN AN ELECTRIC

AFTER being eleven days on the road, during which they covered 916 miles, G. M. Bacon, chief engineer of the Anderson Carriage Company, Detroit, Mich., and G. D. Fairgrieve, one of the company's sales representatives, rolled into New York City in a Detroit electric, conclusively demonstrating that the electric vehicle has other fields than that of city work alone. In other words, there is no reason why it cannot be considered as an ideal car for a leisurely tour anywhere in the Eastern States where charging stations are numerous and never very far apart. The entire trip was made at an average speed of 11 1-2 miles an hour, and 63 miles was the average distance covered on each charge of the battery, despite the great amount of mud and road under construc-

Starting from the Pontchartrain at Detroit.

tion that the electric tourists were compeled to plough through *en route*. With the exception of a single puncture, received just this side of Buffalo, and the necessity for tightening the chains at Geneva, not an adjustment was made on the car in the entire trip, the other three tires not even being pumped, although the car weighs 2,000 pounds and carried 150 pounds of supplies, equivalent to a third passenger.

During the course of their leisurely trip, which was not undertaken with a view to making a record of any kind, but merely to show what the Detroit electric was capable of, the tourists had many amusing experiences. They were badly handicapped by not knowing the country through which they were passing, and, in consequence, could not outline any schedule that would insure their reaching a charging station at the end of each day's trip, but despite this they were not delayed on that account at any time. One of their most interesting experiences grew out of this lack of knowledge of the country and it shows that with a little resourcefulness an electric may be run anywhere through a populated country. According to one of their informants, current was obtainable at Ashtabula, O., but upon arrival there they found they had been misinformed. They were then 30 to 40 miles from Erie, Pa., the next large place on their route, and it was naturally out of the question to travel that distance. They pushed on, however, and a stop was made at Coneaut, O., where connection was made by throwing a wire over the trolley line, and a half barrel of water used as a horse trough was utilized as a resistance through which to cut down the 550-volt current to the required strength for charging the batteries. Upon arriving at Little Falls, N. Y., a place that had been counted on as a recharging station, it was found that the electric light and power plant had shut down for the night before they got there. The obliging attendant, however, ran one of the exciters to accommodate them and the batteries received their full charge before morning, no difficulty being experienced anywhere along the route to get a full charge over night. An experience practically identical with what they encountered at Little Falls awaited them at Hudson, N. Y., but the sight of an electric car on a long jaunt aroused so much interest that aid was always forthcoming and no charge was made for the accommodation in any instance, though if the current had been paid for at the usual prevailing rates the cost of the trip, so far as "juice" was concerned, would have been about $8 to $9, as the car was only on charge 84 hours during the trip.

The only time that the car was unable to run was between Pittsford and Menden, just this side of Rochester. There the electric tourists found themselves on a high-crowned, yellow clay road with the rain coming down hard and no chains on the driving wheels. To have gone any further would have meant the ditch, as it was impossible to run without having the car skid all over the road, which shows that it is a good thing to have chains along.

The average mileage of 64 miles on a charge does not represent anything near the maximum covered without a stop for "juice," despite the extremely adverse weather and road conditions, all of which tend to cause an electric to consume power at an excessive rate for the distance covered. From Buffalo to Rochester, a distance of 77.9 miles, the rain came down heavily for all except 14 miles of the way, making the roads very heavy, in spite of which the distance was covered on a single charge. From Albany to New York there was rain for practically the entire distance, as was the case in Ohio and further west in New York; many of the State roads were ploughed up in the course of rebuilding. The chains were kept on all the way from Albany in, but the distance

Ascending One of the Many Grades Near Erie, Pa.

from Poughkeepsie to New York City was easily made on a single charge in spite of the adverse road conditions.

Bad going did not prevent an excellent showing where distance was concerned, the car averaging about 84 miles a day, the high odometer reading being accounted for by the fact that in numerous cases it was necessary to make detours of several miles to avoid roads that were closed on account of construction, and owing to the numerous demonstrations of the little Detroit electric that were given in every town where the tourists made a stop. Messrs. Bacon and Fairgrieve were determined to go as far as they could without meeting any extreme conditions, or until the task of getting along began to exceed the pleasure and profit to be gotten out of the trip. On being compelled to push or tow, they were going to ship the car home, but they never even came within hailing distance of that misfortune. The Detroit electric in which they made the run from Detroit to the metropolis is equipped with a 48-volt Elwell-Parker motor, driving to the rear wheels by chain, and a 24-cell, 11 MV Exide battery.

LIMIT BOTH BORE AND STROKE IN RACING.

The results of the recent Grand Prix race certainly seem not to warrant the continuation of the 155 mm. maximum bore rule for another year. The French designers who proposed and supported this rule have been the first to admit its defects; and, although they have been accused of self-interest and of wishing to establish such rules as will practically assure a French victory, their position is, nevertheless, quite justifiable. It is undeniable that tires under present high speed racing conditions introduce an extremely undesirable element of luck into the contest.

In the list of proposed amendments, one which has found considerable backing is to limit the stroke as well as the bore. S. F. Edge, the well-known English racing man, is quoted as saying that it is a mistake not to take the stroke into consideration, as it will result in engines of abnormal length of stroke, which are very severe on the mechanism and tires, and at the same time cause a considerable amount of vibration throughout the chassis. "I feel sure that the tremendous failure of tires throughout the Grand Prix race was due, to a large extent, to the length of stroke employed in many of the engines," Mr. Edge comments.

A glance at the specifications shows that the average stroke of the engines has increased from 6.08 inches in 1907 to 6.63 inches in 1908, in spite of the fact that the limited fuel consumption rules in 1907 seemed to favor long-stroke engines. It is hard to believe, however, that this increase alone was responsible for the terrible slaughter of tires. All designers have a pretty close realization of the maximum permissible piston speed, and when they increase the stroke they may be depended upon to decrease the maximum number of revolutions per minute in proportion. Besides, any increase in the stroke means an increase in the height of the engine, and consequent raising of the center of gravity—something never to be risked on a racing car. The true explanation of the unprecedented amount of tire troubles will very probably be found in the increased weight of the cars, which averaged 300 to 400 pounds heavier than those of last year. This extra weight was, in most cases, placed directly over the rear axle, with the idea of securing better adhesion. With the size and strength of the tires remaining the same, and speed increased, the result was to be expected.

Another proposition, which seems to strike much more closely at the root of the difficulty, is to still further decrease the maximum bore. Mr. Edge proposes 127 mm., which translates to a few thousandths over five inches. Such a rule would certainly eliminate tire troubles, both by lightening the cars and by reducing their speed. The question then arises as to whether the reduction of the speed would not take away so many of the spectacular features of the race as to preclude any possibility of its being a financial success. Many of the constructors assert, however, that they can build cars of this size with a speed of 90 miles an hour, which ought to furnish enough excitement, and, owing to the greater regularity to be expected when the disturbing element of tires is removed, the finishes should be closer and more exciting. The danger to drivers and to spectators would be decreased, and as the engines would be held at their maximum power for a larger part of the time, the test for them would be even more severe. The list of entries would be more representative, as most makers could enter cars that would be practically stock models, and would thus avoid an expense at present often prohibitive. On the whole, the 127 mm. bore amendment seems well worth trying, and it should go far toward solving the problem of how to make automobile racing a sane and profitable sport.

While this year's Vanderbilt participants are limited neither in bore nor stroke, but must have a minimum and must not exceed a maximum weight, it is generally believed that the fourth race for the famous cup will be the concluding one wherein speed alone is unconfined, except by what strains and stresses the tires will withstand, which factor, of necessity, must contain something in the way of luck. As soon as a limit is placed on speed, it may be that the spectacular features in automobile racing which attract the public will be extracted sufficiently to cause a diminution in interest. Furthermore, many makers, both here and abroad, are now convinced that racing has lost much of its value to the industry, though those who dissent are still industriously active, and will continue to support those big events which take place near large cities and attract thousands of spectators, among whom are many possible buyers in possible plenty. It is safe to predict that over a million people will see the Vanderbilt race and the Long Island Motor Parkway, October 24 next.

PLANS FOR THE NEXT GARDEN SHOW.

The show committee of the A. L. A. M. has awarded to S. R. Ball for the fifth year the contract for the decorative work of the Madison Square Garden show. The general architectural scheme, prepared by W. W. Knowles, will be something entirely different from any previous show, and it is predicted that it will he effectively pleasing.

TIRE MAKERS WILL STOP PRICE CUTTING.

CLEVELAND, O., Aug. 11.—In a continuation of the effort to put a stop to price cutting, another meeting of the tire manufacturers was held in this city to-day. Nothing very definite was decided upon, and it is thought that another meeting will be held some time before Septemher. At the meeting to-day, which was fairly well attended, the impression prevailed that the best methods of stopping the price cutting would be to cut the dealers' percentage of profit, thus giving him practically no opportunity to cut to the consumer. It is also possible that the list price will be shaded somewhat this year.

The "International Motor League" of Buffalo was also considered at the meeting this morning.

Any changes in the list prices of tires will go into effect September 1, and any changes in dealers' discounts will also be announced at that time.

A. C. A. PLANS A LIGHT CAR RACE.

The governors of the Automobile Club of America have approved of a scheme to run a 200-mile race for light cars in connection with the scheduled race at Savannah, Ga., on Thanksgiving Day under European rules, and have handed the project over to the club's contest committee.

Under the proposed limitations each car must have a minimum weight of 850 pounds and the equivalent of a maximum of 3 3-4 inches cylinder diameter for a four-cylinder motor, or an equivalent in effective surface for motors of a different number of cylinders. This would give a range of 7.50 inches to 2.65 inches for four-cycle motors from one to eight cylinders, and 6.35 to 2.24 inches for two-cycle motors from one to eight cylinders. The cluh announces that the course will be completed by October 1.

DISTANCE ENDURANCE TOURS ARE EDUCATION.

One big manufacturing concern unquestionably believes in long-distance endurance tours, and this is what Col. Charles Clifton, of the George N. Pierce Company, has to say:

"We mix in these national tours for a purpose. It is education and we have come firmly to the opinion that the proper thing to do is to send men from the factory working force to travel on the cars as observers. In making such a trip our men gain a knowledge which cannot be secured in the ordinary testing trip. They ride on cars driven as cars would not be driven in regular tests. In fact, were our men to go out to test cars and abuse them as they have to be abused on these great tours I can firmly say that we would drop them from our list, for the wear and tear placed on a car in one of these two-thousand mile trips is much more severe than any wear and tear which even the most foolish owner would put his car to in a trip. We want to make a car to stand up under anyone who may happen to become a purchaser. From the outset of the big tours we have competed for this reason and the experiences of each year have been carefully noted and incorporated in the cars of the next year. Our experiences have enabled us to produce a car which would do as those of this year did, go through two thousand miles without necessitating the use of even one stock equipment part in the long journey.

"The entire American automobile industry has been benefited by the victory of the Thomas car in the New York to Paris race. The Thomas has beaten European cars in a race around the world and the entire world has had cause to know that America builds cars capable of performing such a feat."

PLANS FOR THE INDEPENDENTS' SHOW.

The show committee of the American Motor Car Manufacturers' Association held a meeting August 5 to perfect arrangements for the Grand Central Palace show, which is to open New Year's Eve. Four schemes of decoration were considered, but none will be chosen until the next meeting, to be held within two weeks. In addition plans were made for the allotment of space among the different classes to be represented. All the main floor and part of the first gallery will be occupied by American and foreign pleasure vehicles. On the first balcony will he the taxicab division, the commercial vehicles and motorcycles. The motor and accessory manufacturers will be on the first and second balconies. A more liberal trade ticket plan will be followed, but the plan for demonstrators will be retained.

Those present at the meeting were: H. O. Smith, chairman; R. M. Owen, D. J. Post. Benjamin Briscoe and Alfred Reeves. E. Rand Hollander, representing the importers, is at present in Europe arranging for the foreign exhibits.

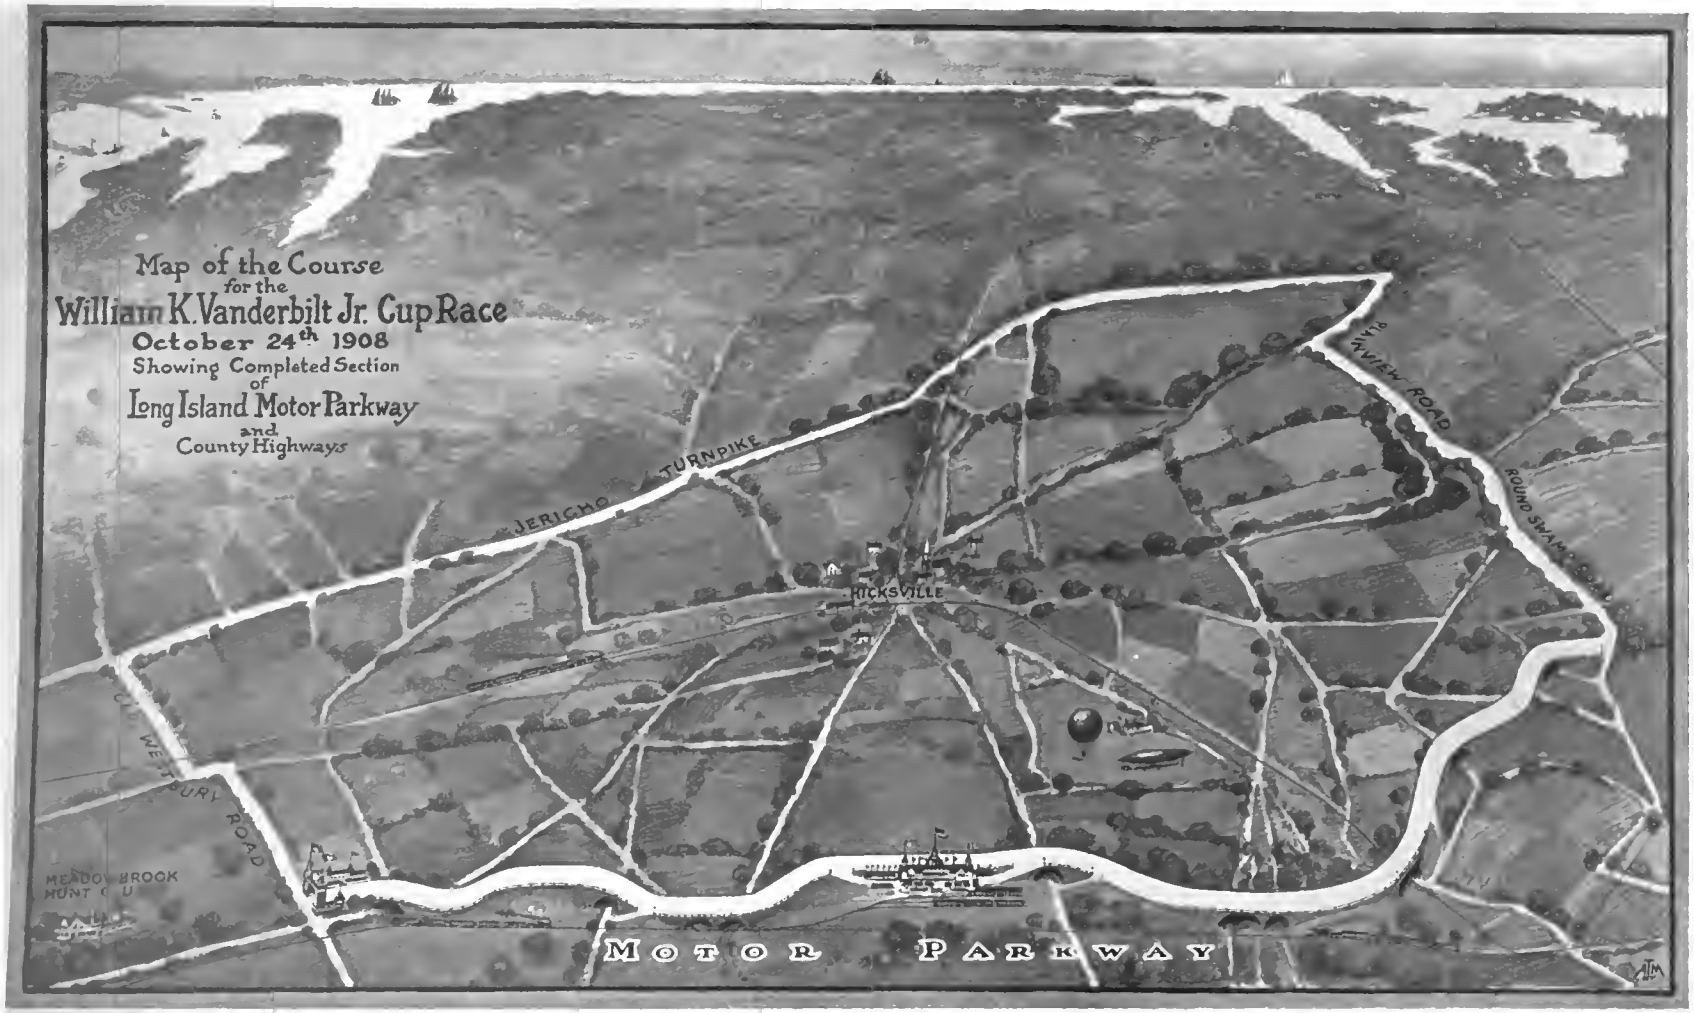
Locomotive Motor Cabs in Philadelphia.

TAXICABS INTRODUCED IN PHILADELPHIA.

PHILADELPHIA, Aug. 10.—Taxicabs are now in service at the hotels and railroad stations of Philadelphia. At the formal opening of the system President Claude S. Jarvis, of the Quaker City Cab Company, took Mayor Reyburn and two score other notables on a short run and afterwards entertained them at luncheon. The cahs are of the American Locomotive Company's make, finished in dark hrown with yellow running gears. They were well tested on the opening day, many of them carrying six persons over some very rough roads, but no mishaps marred the celebration.

OLDFIELD DRIVING A STEARNS.

LEXINGTON, KY., Aug. 10.—Barney Oldfield and Charley Soules, his mate, opened the eyes of the farmers and horse breeders at the Blue Grass Fair to-day by putting up miles in 59 1-2 and 59 3-4 seconds, respectively, in their Stearns racing machines. These figures both beat the State and track records. Barney in a three-mile match beat out Charley in 3:17. An Oldsmobile, driven by Phil Barnes, walked away with the two-mile race for fully equipped cars.



THE cement portion of the new Vanderbilt course will be 28 feet wide; crossing all intersecting railroads and highways overhead by cement viaducts, now in course of construction. These viaducts and bridges are the most expensive portions of the new motor highway. They must be fully 20 feet above the level of the intersecting dirt and railroads. The approaches must be tapered down so that the racing cars can take them at full speed. All of the turns on the cement highway are symmetrically rounded and banked, permitting a maintenance of the speed attained on the level stretches.

Round Swamp road, which runs north, on a slight grade, to the beginning of the Plainview road. Following this road the car continues on north to its intersection with a new extension of the Jericho turnpike. At this point the course bends directly west, around what has been dubbed the "Flatiron Turn." The cars have a very speedy stretch, nearly all down grade, westward along the Jericho turnpike extension to Jericho, one of the turns on the 1906 Vanderbilt course. From there the new course is over the old Jericho road to its intersection with the old Westbury road, thence south across a

BUSY PREPARING FOR THE VANDERBILT CUP RACE

NEW YORK, Aug. 12.—With the return of Jefferson deMont Thompson, chairman of the A. A. A. Racing Board and Vanderbilt Cup commission, from a brief vacation spent in touring New England, preparations for the Vanderbilt race have received an appreciable impetus.

Mr. Thompson is confident from correspondence and assurances he has received from manufacturers that the arrangements the commission has made for the elimination trial will not have been made in vain. Previous experience with the Vanderbilt race and the Glidden tour have invariably shown a tardiness in making nominations, the last day, as a rule, bringing the majority. Though the entries for the cup race will close on September 1, chance is given makers who later decide to enter the lists to secure the privilege of starting by the payment of a double entry after that date, up to October 1.

Chairman Thompson, General Manager Pardington, of the Long Island Motor Parkway, and other A. A. A. officials are co-operating with the Nassau county supervisors in their efforts to enforce the speed laws on the roads of that county. The conference at the Mineola court house was the outcome of the commission's pledge to back up the Nassauvians in the matter by way of showing well deserved reciprocity for their liberal-mindedness in granting the use of their highways for the cup race and the practice and elimination trials incident thereto.

It is probable that practice on the new course will be permitted candidates for the elimination trial by the Nassau supervisors between sunrise and 7 o'clock in the morning after October 1. There will be, however, no let-up in the crusade that is about to be started against speeding on the county roads. Drivers of non-competing cars violating the laws in this respect will be arrested by the special motorcycle "cops" to be put on permanent duty, and so will also drivers of cup cars who exceed the speed limit outside of the hours set apart for the practice.

Big Demand Early for Grand Stand.

A big demand is already in evidence for Vanderbilt race boxes on the mammoth grandstand, which is to be built on the cement racing stretch at the starting and finishing point. So large has it been that the cup commission has decided to lease the limited number of front row boxes only to persons who will take them both for the elimination trials on October 10 and the race on October 24. A. R. Pardington has issued a warning against purchasing boxes and seats from any persons claiming to be erecting stands along the motor parkway, inasmuch as the cup commission has secured control of the land on both sides of the cement stretch to prevent spectators from locating outlaw stands. He says it will be impossible to get from such stands any extended view of the race or any details until long after it is over, since all telegraph and telephone wires will be under the control of the commission.

The race will start, as usual, soon after daylight, and the grandstand, which is to be located on a portion of the new cement way, where the spectators are afforded the finest view of the cement course, will be reached directly by special trains on the Long Island Railroad. A branch of this road runs directly from Long Island City to Garden City, which is about four miles west of the beginning of the course. Although the regular trains do not run below Garden City at present, the tracks are in good repair as far as Bethpage, which is the eastern terminus of the parkway, and the railroad company proposes to run sidetracks to the rear of the grandstand.

It may be possible for visitors to the race from a long distance to take a sleeping car at Long Island City on the night preceding the race and remain in it on the grandstand sidetracks until the racing cars are called to the line at daylight.

Never before have such complete arrangements been made for the accommodation of visitors to an automobile race. There will be 11 miles of elegant parking space on either side of the cement way, under the control of the Cup Commission. Heavy steel wire fences will line the parkway from beginning to end, so it will be impossible for cars to pack at any particular spot. They will be admitted at the Whaleneck avenue entrance, which is the eastern entrance and beginning of the parkway, and lined single file, in accordance with the official parking space diagrams. These spaces, together with boxes and seats in the grandstand, may be obtained by application to Jefferson deMont Thompson, chairman of the Vanderbilt Cup Commission, at the offices of the American Automobile Association, 437 Fifth avenue.

Acme Six-Cylinder for Vanderbilt Cup.

Formal entry of a six-cylinder Acme has been made for the Vanderbilt Cup race. It is nominated by the Acme Motor Car Company, of Reading, Pa., and will carry the colors of one of the Pennsylvania clubs affiliated with the American Automobile

Trio of Packards Trying the Motor Parkway Curves.

Association. This company made its début in the road racing game at the Savannah meet last March. Its car, which was also of the six-cylinder type, finished third in the big race for the Savannah cup, despite the fact that its pilot was inexperienced in the racing game and drove his machine on a rather conservative time schedule. Who will be its pilot over the Long Island course has not yet been determined, though negotiations are in progress with several racing drivers of repute.

The racer will have a six-cylinder motor with five-inch bore and five-inch stroke. It is conservatively rated 60-horsepower at 1,000 r.p.m., but has been tested to upwards of 1,800 r.p.m. The cylinders are cast singly, with valves on opposite sides. The wheelbase is 116 inches, and the wheels, front and rear, are 36 by 4 1-2 inches. The gasoline capacity will be about 40 gallons, and the tank will be directly back of the driver's seat. The car is so far advanced toward completion that much road testing of it is expected to be accomplished before the close of the present month.

Entries of two Locomobiles and two Thomas racers are indicated in the next few days.

PROPERLY TIMING MAKE-AND-BREAK IGNITERS

THERE is much more involved in the successful operation of the make-and-break ignition system than simply correct timing of the break and proper insulation of stationary electrodes. In addition to these primary requirements are the following: *A*—The contact must have a sufficiently long dwell to permit the current to build up in the armature winding or the spark coil; *B*—The contact points, if of steel, must be reasonably clean and comparatively free from oil; *C*—The rocking electrode must not be worn so loose in its bearing that the moment of break or the certainty of good electrical contact can be affected by its wabbling; *D*—The adjustable rods or stems actuating the igniters must be true and free in the cupped ends of the outer rocking arms. Fig. 1 shows approximately the customary section of the igniter cam. It will be seen that both the lifting and the descending faces are angular. In other words, contrary to the common practice in marine and stationary engines, it is not what is known as a "snap" cam. The object of this is to permit the cam to turn backward in case of a back kick without damaging the mechanism and without the complication of a trip finger. The effect of this angular descent is to make the precise moment of rupture a matter of some importance, since the arc traveled by the crank during the roller's descent is double the arc *A*. As is evident from the

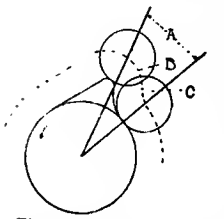


Fig. 1—Customary cam profile for low-tension ignition.

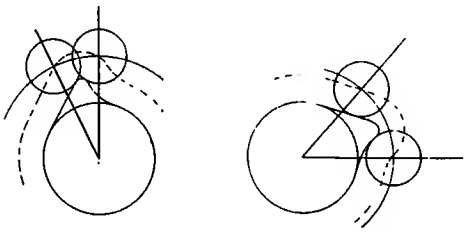

Figs. 2 and 3—Illustrating difference in endurance of contact of two cams.

dotted line indicating the path followed by the center of the roller, the movement of the roller is slow at the top of the cam, and consequently the spark produced if the break occurs, *e.g.*, with the center of the roller at *B*, is not as strong for the same flow of current as it would be with the roller *C*. Again, contact is made when the roller is at the same distance from the center of the cam as on the break, and the dwell in contact is therefore comparatively short in Fig. 2 and much greater in Fig. 3, as the angles shown in dotted lines indicate. It is easily possible for the dwell to be too short to produce an effective spark, and when a magneto is the source of current it is a safe rule that the electrodes shall make contact during at least the upper half of the cam's lift.

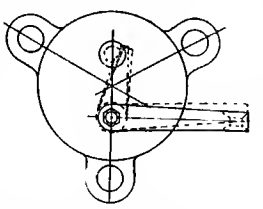

Fig. 4—Effect of wear on the time of the break.

If the contact points are of iridio-platinum they will wear very slowly, and the spark time will be but slightly affected by their wear. If, however, the contacts are steel they will burn away rather rapidly. This has the effect of changing the position of the outer arm of the igniter as shown in Fig. 4, and both reduces the dwell and causes the break to occur earlier than before. The rate at which this progressive change in timing goes on will depend partly on whether the magneto or battery is used, being usually greater with the latter, and on the area of the surfaces in contact, being obviously greater when the available surfaces are small. An insulated stem which has been in use for some time and has been turned repeatedly to bring fresh surfaces in contact assumes finally a form resembling that at *A* in Fig. 5, and the contact finger has probably acquired the shape shown at *B* in the same sketch. When this condition is reached, if the contacts are continued further in service, it is probably necessary to change the angle of the outer arm owing to the limit of the igniter rod's adjustment having been reached. This arm usually is a taper fit on the rocking stem, and a little careful trial will establish a suitable position for it. It is essential occasionally to file the contacts clean and smooth, and at more frequent intervals to polish them with emery cloth to remove the burned scale which forms on their surfaces.

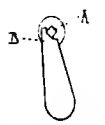

Fig. 5—How the contacts wear away.

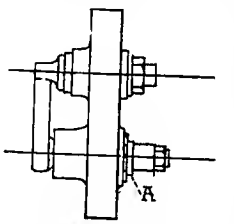

Fig. 6—Correcting a tendency to shake.

In case the rocking stem wears loose and shows a tendency to wabble, it may be kept fairly steady by inserting a washer at the outer end of the bearing as at *D* in Fig. 6. It should be remembered that the wabbling tendency is chiefly promoted by the igniter rods themselves being crooked and bearing sidewise against the rocking arms. This has a further objection in that the friction of the rods against the arms on the first downward movement is more or less liable to cause a premature break. The rods should be guided entirely from below and should exert no pressure whatever against the igniter arms except in the vertical direction.

The synchronizing of igniters is most easily and accurately done with the aid of one or two cells of battery and a voltmeter. If the battery is part of the standard reserve equipment it is not necessary to make any change in the connections, except to break the connection from the switch to the bus bar and insert the voltmeter. Then the spark lever is fully retarded and the flywheel turned to one of the dead positions, which are usually marked on it. This position should be the breaking position for whichever igniter is in action at that instant.

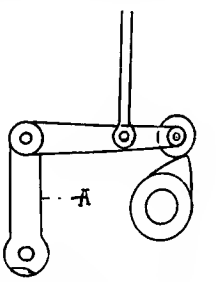

Fig. 7—Bent arms may cause loss of synchronism.

While contact is established the voltmeter will indicate the fact, and the instant contact is broken the needle will return to zero. Adjust the igniter rod up or down until on two or three successive trials the break occurs at exactly the right point, and see that tightening the locknut on the igniter rod does not change this adjustment. Turn the crank again and watch carefully the movement of the igniter rod after contact is made. If it does not move up half its total travel after contact is made, take off the igniter plate, slacken the taper fit of the outer arm on the rocking stem, and turn the arm very slightly downward. Replace the igniter plate and readjust the igniter rod. When the first cylinder has been satisfactorily timed, take the second, and so on. It is best to cut out all the cylinders except the one under test.

If the advance and retard follow Mercedes lines, as in Fig. 7, it is possible that a back kick may have bent some of the arms *A*. This is tested by turning slowly and noting if all the rollers begin their ascent or descent at the same crank position. If not, they must be made to do so by bending the arms, *A*, otherwise the timing will be for one position of advance only.

HOW THE CLUBS ARE DOING EFFECTIVE WORK

HARTFORD CLUB DOING GOOD SIGN WORK.

HARTFORD, CONN., Aug. 10.—One of the chief activities of the Automobile Club of Hartford at the present time is the sign-posting of the Connecticut roads in different parts of the State, so that the members of the sign post committee are now the busiest in the club. As is the case in a great many States, the roads in Connecticut came from nowhere and led to nowhere else until the local club undertook the work of putting up appropriate signs for the benefit of the visiting autoist, as well as the resident, for many of the latter could be lost on their own roads, so complete was the lack of information. The work will be continued until all the principal routes are posted.

Preparations are now under way for the hill climb to be held under the auspices of the Automobile Club of Springfield, September 11. C. H. Gillette, vice-president of the Automobile Club of Hartford, has been requested to act as referee and has consented to do so. It is confidently predicted that the hill climb will be one of the largest and most successful ever held in Connecticut, as all the famous climbers have promised their entries.

COUNCIL BLUFFS TO HAVE A CLUB.

COUNCIL BLUFFS, IA., July 31.—A meeting was held recently by a number of automobilists of this city to consider the formation of an automobile club, to be affiliated with the American Automobile Association. The organization would act in conjunction with similar bodies at Davenport and Mason City, Ia., to form a state association. The meeting was presided over by M. Woolman, president of a club formed here several years ago. Dr. T. B. Lacy, Dr. Jeffries and T. S. Davis were appointed a committee on organization.

HARRISBURG CLUB ERECTING SIGNS.

HARRISBURG, PA., Aug. 10.—The Motor Club of Harrisburg has recently appointed a special sign board committee consisting of J. Clyde Myton, James McCormick, Jr., and Dr. John Oenslager for the purpose of placing sign boards along all the important roads entering the capital city of Pennsylvania and especially mark the short route running from this city to Gettysburg. The club has appropriated $150 for the sign board work and work has already been started.

The Motor Club will hold an economy contest over the asphalt streets of the city next Saturday to show just how much mileage can be secured on a gallon of gasoline from various cars in their daily use in the city. Later in the month a similar contest will be held over country roads to show the relative use of fuel between city streets and country roads.

GYMKHANA FOR ROCHESTER AUTO CLUB.

ROCHESTER, N. Y., Aug. 10.—The Rochester Automobile Club will hold its annual gymkhana at Genesee Valley Park Saturday, August 15. There will be twelve events, including the usual obstacle, potato and speed-judging races, and several new and original contests which are expected to provide much amusement. The club is extending its activities in many other directions as well. Tuesday, August 11, will be Orphans' Day, and 140 cars are expected to come out to give the city's charges a run to Ontario Beach. Road signs are being placed on the roads leading to Syracuse. Nearly fifty members have taken advantage of the club arrangements with the Canadian Custom House and are touring in that country. The total membership of the club is now 504, and it is still rapidly on the increase.

"Jersey Justice" as Depicted by "Motor Record," the Official Organ of the New Jersey Automobile and Motor Club.

CHAS. B. SHANKS, STEARNS' SALESMANAGER.

CLEVELAND, O., Aug. 10.—Charles B. Shanks has just been appointed salesmanager of the F. B. Stearns Company and will immediately enter upon the new duties of his office with the latter concern. He will still continue as the head of the Shanks Selling Company, the firm which he organized immediately upon severing his relations with the Winton company, and in addition to the Chalmers-Detroit line, which he took on for northern Ohio at that time, he will also sell the Stearns cars at retail in Cleveland and vicinity.

Charles B. Shanks.

For the last ten years Mr. Shanks has been the manager of the advertising and sales departments of the Winton Motor Carriage Company, of the same city, and during that time he has made himself one of the best known salesmanagers in the industry the country over. The forcefulness and energy of his methods have accomplished much in the selling line, while his personal geniality has won him a host of friends, so that it is not at all strange that his stepping into the retail field came as a great surprise to all who knew him nor that other companies should immediately bid for his services. He has a fund of knowledge concerning the necessary ways and means for successfully marketing a factory's product that is possessed by few and which it seemed a pity not to give some enterprising company the benefit of.

As a result of this latest move the Shanks Selling Company, 1526 Euclid avenue, Cleveland, will be in charge of R. H. Williams, formerly manager of the Winton branch at Baltimore, and the company will handle the Stearns line at retail in connection with the Chalmers-Detroit. The cars do not conflict in any way, and the combination is regarded as an excellent one. As an assistant manager in the sales department of the Stearns Company, Mr. Shanks will have Hal Sheridan, who has been prominently connected with the White Company for a number of years past.

President Frank B. Stearns, of the Stearns Company, in discussing the new Stearns-Shanks combination, said: "We are very glad that changing conditions made it possible to take Mr. Shanks into our company and to turn over to him the disposal of our output. We have wanted him for a number of years, but his resignation from the Winton Company gave us the first chance we ever had to bid for him."

RENTING DEPARTMENTS PROVING VALUABLE.

Harry S. Houpt, of New York, has started a Thomas Flyer renting agency. Though run from the Harry S. Houpt Company's headquarters, it is a private enterprise of Mr. Houpt, who says he will start the service with five cars and will furnish neatly uniformed chauffeurs.

In this connection it is to be noted that not a few agencies maintain rental departments either directly or indirectly connected with their selling agencies. They not only furnish a profitable haven for shop-worn cars and cars taken in exchange, but make it conveniently possible to furnish temporary employment to chauffeurs, thus affording at all times trusted and competent pilots for purchasers and customers.

One prominent New York branch, which conducts a rental department under an independent name, turns over to it the exchange cars and charges their cost against their maintenance for a year. A car taken in exchange at $1,500, for instance, would have $125 per month charged against it for one year. Despite this conservative book-keeping, the department, besides the advantages it otherwise affords, yields a good profit.

DETROIT CONCERNS BUSILY OPTIMISTIC.

DETROIT, Mich., Aug. 10.—If any injurious effects from the recent industrial depression remain they are not in evidence among local automobile factories. Never before in the history of the industry have Detroit concerns faced a more favorable outlook than at the present time. From all quarters come optimistic reports, backed up by figures that do not exist solely on paper, but represent real money. The question now confronting makers is how to handle the business that is coming their way, with a rush unlooked for even by those who had planned most carefully. This may be accounted for in part by the introduction of several high-grade models at a lower price than hitherto prevailed, and the switch of one concern to the licensed ranks, bringing it in touch with agencies that open up a field that was not available under old conditions.

With one of the most spacious plants devoted to the production of automobiles, and with facilities that were supposed to be ample for all time, the Packard Motor Car Company has been forced to greatly increase the size of its factory, owing to inability to expeditiously handle the constantly growing demand. Two more concrete and brick additions are to be added at a total cost of $100,000. They will give 150,000 square feet more floor space and enable the company to increase its working force from 2,500 to 3,000. Another building is also under consideration.

Things are humming at the Cadillac plant, where the new Cadillac "30" will soon be coming through in great numbers. At the Chalmers-Detroit plant conditions are similar, the new "30" keeping everybody on a jump, in addition to the present Chalmers-Detroit car which has proved so popular.

Still another "30" that is making things lively is the Everitt-Metzger-Flanders car, preparations for producing it in great numbers going forward rapidly. The Ford Motor Company is, of course, keeping up the pace that has made it famous. The Brush Runabout Company, the De Luxe, Aerocar and other plants are all in a prosperous condition and the sun once more shines on both sides of the street so far as local automobile makers are concerned.

DEATH OF CHARLES G. HUNTINGTON.

HARTFORD, CONN., Aug. 10.—Charles G. Huntington, for many years advertising manager of the Electric Vehicle Company, of Hartford, died at his home in this city on the morning of Saturday, August 8. He had been in poor health for the past few years, but remained at his desk until a year ago. Previous to his connection with the Electric Vehicle Company, he was advertising manager for the Pope Manufacturing Company, and before that was a teller with the Connecticut River Banking Company, and one of the editors of the *American Cyclist*. During the heyday of cycling he was prominently identified with League of American Wheelmen affairs in Connecticut, and was at one time chief consul of the Connecticut division. At this period of his career he compiled the first road book of Connecticut, which met with a wide sale.

Mr. Huntington always took an active interest in the city government and served on both the fire and the police commissions. He also did very efficient work on the school district commission. In politics he was a Democrat. He was of a genial disposition and of the sort that readily made friends, and in the old days at the Electric Vehicle Company "C. G.," as he was familiarly called, was the soul of many a gathering. He had a wide acquaintance with the advertising men, who hold him in the highest esteem. During the past two years of his life he suffered much, but even this was not sufficient to dim his sunny disposition. His was a nature that will be missed for a long time to come, and in his death the industry loses a familiar figure. He was a member of Hartford Lodge, F. A. M.

A. L. A. M. ADOPTS STANDARD DETACHABLE RIM.

ACTION on various matters of importance was taken by the Association of Licensed Automobile Manufacturers at its general meeting held in New York, August 6. It embraced the election of a successor to H. H. Franklin, whose resignation as treasurer was tendered after three years of service and accepted. Col. George Pope was unanimously chosen to fill the vacancy.

After many months of negotiation by the rim and tire committee, a quick detachable rim was at last adopted on its recommendation. It will be known as the "Standard universal quick detachable," and is the same rim as was under discussion at the N. A. A. M. meeting the previous day and pronounced satisfactory. The Mechanical Branch of the Licensed Association has been working on the rim situation for the past year and felt the need, both for the individual users and automobile manufacturers, of a standard quick detachable rim, which would take both a clincher and quick detachable shoe of any make, thus minimizing the existing inconvenience of having to have a shoe of one make to fit a given rim. After experimenting with all the quick detachable rims, co-operation with the tire and rim makers resulted in the adoption of this rim, which is the result of hard and persistent efforts on the part of the tire and rim makers to get something that would be adopted by all manufacturers, both in and out of the association.

M. J. Budlong and R. D. Chapin were added to the rim and tire committee, whose chairman is A. L. Pope.

The report of the show committee was approved. Accordingly at the next general meeting, which is likely to be held early in September, awards for space for the Madison Square Garden show will be made. It was recommended that the usual method of allotment be adopted, which is according to the amount of business done from July 1, 1907, to July 1, 1908 by the various bidders for space.

The report of the handbook committee was accepted, and work on the 1909 handbook will begin at once, as several of the members have already forwarded photographs and specifications for the sixth edition of this book.

Those present were: M. I. Brock, Autocar Company; W. C. Durant, Buick Motor Company; W. C. Leland, Cadillac Motor Car Company; R. D. Chapin, Chalmers-Detroit Motor Company; M. S. Hart, Corbin Motor Vehicle Corporation; E. R. Hewitt, Hewitt Motor Company; A. N. Mayo, Knox Automobile Company; S. T. Davis, Jr., Locomobile Company of America; V. M. Gunderson and W. E. Metzger, Northern Motor Car Company; F. L. Smith, Olds Motor Works; M. J. Budlong, Packard Motor Car Company; L. H. Kittridge, Peerless Motor Car Company; Charles Clifton, George N. Pierce Company; George Pope, Pope Manufacturing Company; G. E. Mitchell, Alden Sampson, R. H. Salmons, Selden Motor Vehicle Company; F. B. Stearns, F. B. Stearns Company; I. H. Page, Stevens-Duryea Company; A. W. Church and O. G. Bechtel, Waltham Manufacturing Company, and Thomas Henderson, Winton Motor Carriage Company.

INTERPRETING THE OHIO LAW.

TOLEDO, O., Aug. 10.—The attorney-general's office of the State of Ohio has just rendered a decision under the Ward automobile law which will greatly increase the revenues derived under that act, to say nothing of causing corporations to secure chauffeur licenses for all of its employes who run any automobiles or autotrucks such corporation may have. The Ward law provides that an owner of a machine may run it without a license, but in its opinion the attorney-general's office holds that because one owns stock in a corporation, he is not an owner of any automobiles said corporation may own, and to run such automobile the driver must have a license; the same law covering any employes whose duties may be to run such machines or trucks.

STUDEBAKER AND E.-M.-F. SALES COMBINATION.

SOUTH BEND, IND., Aug. 10.—The latest combination in the American automobile industry is that of the sales departments of the Everitt-Metzger-Flanders Company, of Detroit, and the Studebaker Automobile Company, whose factories are located in this city. In other words, William E. Metzger and Hayden Eames, manager of the Studebaker Company, will co-operate in marketing the proposed output of 12,000 E.-M.-F. cars, the American territory being divided between them. The Studebaker concern has contracted to sell 6,000 of the E.-M.-F. cars through its large and effective sales organization, comprising eight branch houses and fully 5,000 retail dealers, and will have exclusive control of the foreign business, its export interests being very large in all parts of the globe.

"We are highly pleased at its consummation and frankly believe it will prove to be the most important move that has been made in the automobile business," said Colonel George M. Studebaker, when asked to verify the report. "We considered it more advantageous to us to form an alliance with a group of men such as that comprising the Everitt-Metzger-Flanders Company, possessing as they do factory facilities, experience and manufacturing ability of a rare order, as well as an intimate knowledge of the problems peculiar to the motor car, than to establish a separate factory of our own.

"It has long been our intention to go into the marketing of cars on a large scale. The chief factors which have deterred us until now were: First, the unsettled state of the market; second, the expensive and wasteful sales methods, which, in our opinion, made the business an unsafe one, and, last but not least, the lack of stability in design which rendered the making of a large number of cars of any one type a risky business. These conditions having changed, we decided the time was ripe. The Studebaker sales department and the E.-M.-F. manufacturing organization should prove a strong combination.

BRUSH RUNABOUTS' TRIUMPHAL PROGRESS.

With the sole purpose of demonstrating that the lowest-priced automobile on the American market to-day is likewise an economical and practical motor vehicle, the Brush Runabout Company, Detroit, Mich., started four of their new Model B runabouts, selling at $550, and one of their little 500-pound delivery wagons, listing at $600, from that city on August 1, on what they term "a 1,500-mile efficiency run." The cars were all dispatched at the same time, leaving the factory on a Saturday afternoon, and each striking out on a different course. Car No. 1 is bound for New York and Boston, and successfully reached the headquarters of the Brush-McLaren Company, 47 William street, Newark, N. J., last Tuesday. It remained in that city for a few days in order to demonstrate its fitness after the long run to a number of interested autoists, and then proceeded into New York, where the same procedure was gone through. Following this, it again struck out on the last leg of its journey to Boston, which will be reached some time next week, as the cars are all proceeding by roundabout routes in order to be able to make demonstrations in as many cities along the way as possible.

Of the others that left Detroit at the same time on similar missions bound, car No. 1 is on its way to Philadelphia and Washington, while car No. 2 is well along on the trip to Kansas City, Mo. It will not stay there as the end of its journey, but will continue on to Denver and take a try at Pike's Peak. Car No. 4 is bound for Minneapolis, while the delivery wagon, which is Brush car No. 6, will make the round trip between Milwaukee and Detroit. Deducting the time necessary for demonstrations, the cars have been averaging 80 to 100 miles a day without any difficulty, and, in every case, are ahead of the schedule mapped out for them by the Brush company before leaving the factory.

Garage of the Keystone Motor Car Company, Oakland, Cal.

San Francisco, Cal.—The new garage of the Jerome Garage Company recently opened at Polk and Jackson streets is unique in that no sales whatever are made there, the building being devoted entirely to the care of cars. It occupies nearly a quarter of a block, having on its three floors a space of 65,000 square feet. About 200 cars can be accommodated. On the second floor is a handsomely fitted up club room for chauffeurs, and also the machine shop, which is so completely equipped that it is believed an entire car could be built there without the addition of another tool. On each floor there are two turntables and two elevators convey cars from floor to floor. The establishment is in charge of Manager Eugene Silver, until recently with the McDuffee Automobile Company, of Chicago.

Cincinnati, O.—The garage built last winter by the Reliance Motor Car Company has been acquired by the Herschede brothers, who have incorporated and are continuing the business of the other concern. The building is situated in Avondale at Reading road and Maple avenue, with a 107-foot front on the former and 180 feet on the latter. The situation is very favorable, being on the usual route out from the city and in one of the best residential districts. The main floor has a capacity of about 75 cars; in the rear is a well-equipped machine shop, and in front the office, waiting room, salesroom and a small shop for drivers who wish to do their own repairing. The company will carry the agencies for several American and foreign cars.

Syracuse, N. Y.—The Utica Motor Car Company has purchased the garage of the Genesee Automobile Company at 242-252 West Genesee street, in this city, and will continue the business under its own management. The garage has a frontage of 63 feet on West Genesee street and extends back 84 feet on Franklin street; it contains ample display space, machine shops, etc., with a lounging room for chauffeurs in the basement. The company has the agency for the Peerless, Pope-Hartford and Cadillac.

Chicago, Ill.—The Rambler Garage Company, of Chicago, will erect at 1218 Sheridan road a 45-foot addition to the present garage, which already has a 100-foot frontage. The building will be three stories high and will cost approximately $20,000. The business of the Rambler Garage Company has increased to such an extent owing to the growing number of automobile owners on the north side of Chicago that it far exceeded the capacity of the present quarters.

Pasadena, Cal.—A novelty in garages is that of the Electric Garage Company, at 100 East Union street, which is devoted exclusively to electric vehicles. The building is of reinforced concrete and brick, with a floor space, including a fireproof basement, of 14,400 square feet. Pasadena has as many, if not more, electric than gasoline cars, and that means a good many, as it is said to have more automobiles in proportion to its population than any city in the United States.

Oakland, Cal.—The Keystone Motor Car Company's garage at Telegraph avenue and Twenty-second street in this city is one of the handsomest on the Pacific Coast. It was erected at a cost of $12,000, and D. C. McCord is the manager. There is a floor space of 16,000 square feet and in the well-equipped workshop six men are employed. The company is agent for the Acme, Marion and Overland.

Richmond, Va.—About September 1 the Gordon Motor Company expects to occupy its new garage, now being erected, which will be the largest and best equipped in this part of the country. The building is located on West Broad street, opposite the ball park, and will cover every foot of space on its 84 by 120-foot lot. Besides its garage business the company will have the agency for several gasoline automobiles.

Portland, Ore.—One of the most substantial and best-equipped fireproof garages in the Northwest is now the home of the Oregon Motor Car Company, R. E. Heath, manager. It is one story high, of brick and cement construction. The company makes the agency business its specialty, handling the Tourist and the Moon, and the garage is intended to take care of the company's patrons only.

Augusta, Ga.—The Augusta Motor Company is now occupying its new garage at 712 Ellis street, and will do a general garage, agency and repair business. L. M. Coward, an experienced automobile men, holds the position of general manager, and has under him several expert repair men direct from the factories. The company has the agency for the Reo, Premier and White steamer.

Kansas City, Mo.—Ground has been broken for the erection of a new garage for the Studebaker Company, to be located on Grand avenue, near Seventeenth street. Until the new building is completed the company will make its headquarters in the former home of the Auto Motor Company, at 1122-24 East Fifteenth street.

St. Paul, Minn.—The St. Paul Motor Vehicle Company has what they claim to be the finest garage in the Twin Cities. It has a frontage of 87 feet and a depth of 168 feet, of concrete construction, and up-to-date in every particular. The company has the agency for the Oldsmobile, Buick and Columbia Electric.

Washington, Pa.—Another garage has been opened in this city by Howard H. Tanner and Fred C. Berthel, the firm to be known as the Standard Auto Company. The garage is located at 29 East Wheeling street, where considerable remodeling is being done.

Lincoln, Neb.—The Nebraska Automobile and Storage Company is opening the largest garage in the State at 1226 N street, where they will handle the Chalmers-Detroit. They will carry a general line of supplies and do a renting and storage business.

Burlington, Vt.—The automobile department of the Burlington Machine and Repair Company has been separately organized under the name of the Burlington Garage Company, which will occupy new brick quarters on Mechanics street.

Little Rock, Ark.—A new garage is being planned by W. L. Tedford and some associates. It will probably be built of concrete blocks, 40x60 feet, on East Fourth street. The demand is believed sufficient to justify the investment.

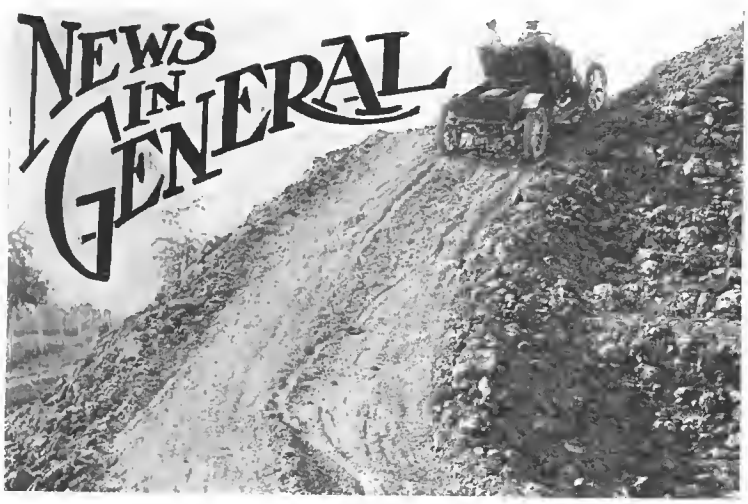
Newark, N. J.—William Bowden is erecting a garage at 401 Clinton avenue. Mr. Bowden does not intend to represent any machine, for the present at least, but will simply do a general storage and garage business.

Joliet, Ill.—A new garage, possessing all the advantages of location and equipment, was recently opened by L. J. Kinnel at 102 West Jefferson street in this city. Mr. Kinnel is the Joliet agent for the Mitchell.

Atlanta, Ga.—The new Atlanta home of the Maxwell at 34 Auburn avenue has just been opened. The new building is of brick, one story high, and of adequate size to handle the company's growing business.

York, Pa.—John Oden is the manager of a new garage in this city. The building has a frontage of 34 feet on Philadelphia street, and a depth of 58 feet, and is thoroughly up-to-date.

NEWS IN GENERAL



Packard Testers Using Embankments of Michigan State Rifle Range, near Detroit.

Packard's Novel Testing Ground.—The testing corps of the Packard Motor Car Company, always on the lookout for new hills to conquer and to use in the regular testing of Packard cars, recently discovered and obtained the privilege of driving on the embankments of the new Michigan State Rifle Ranges, near Detroit. These embankments, or butts, as they are called in military parlance, are clay and gravel hills, 40 feet high, with stiff grades, the steepest of which is 45 per cent. They form an ideal hill-climbing test under ordinary rough road conditions. The construction company men, and afterwards the United States troops using the ranges, were much interested in the way in which a dozen cars at a time were driven over the hills, some from one side and some from the other. The Packard testers are now busy on 1909 cars, of which approximately one hundred have already been delivered to purchasers. The factory is running a full force of 2,500 men and this is being increased each week. When two additions now under construction are completed, the number of employees will be larger by several hundred.

Diamond Tires Around the World.—The Diamond Rubber Company, Akron, O., on the completion of the round-the-world race, received the following telegram from the E. R. Thomas Motor Company, of Buffalo, N. Y.: "In New York to Paris race not only an American car but also American tires scored important triumph. Diamond quick detachable tires on the Thomas car gave excellent service. Not only did the casings withstand hard usage to an almost incredible degree, but the tubes of the same make showed equally good results. At no time was the Thomas seriously delayed by tire trouble, and it is safe to say that every known species of road in the world was encountered save those of the tropics.

"Wag" Comes a Cropper.—Fred J. Wagner was unavoidably detained from business on Monday last through being mixed up in a little auto accident of his own. He was out in his car Sunday with his son, Fred J., Jr., in the driver's seat, and his wife in the tonneau. While making good time along Jerome avenue, New York, young "Wag" was seized with vertigo and fainted. The car swerved and ran into a telephone pole, throwing all three out. "Wag" sustained a cut on his leg, which required several stitches; Mrs. Wagner was cut about the mouth, and Fred, Jr., was a bit bruised.

Pullman Increases Capacity. — The York Motor Car Company, of York, Pa., makers of the Pullman cars, have made changes in their plant which will more than double its capacity. The main building had, until the present time, been divided between the production of carriages and automobiles, but the growth of the latter business made it necessary to move the carriage plant away, and the whole building is now devoted to the making of autos.

Trade's Summer Capital in Maine.—Christmas Cove, Me., has some excuse this summer for putting on airs as a bit of an automobile trade summer capital, since it will harbor for several weeks to come S. A. Miles and Alfred Reeves, respectively, general managers of the N. A. A. M. and the A. M. C. M. A., and Robert Garden, manager of the Harrolds Motor Car Company, New York agents for the Pierce.

New Body Builders.—The Fischer Body Company has purchased the plant of the Gier planing mill on St. Antoine street, Detroit, Mich., and will commence operations there at once. A two-story building, 250x50 feet, will be erected for use as a mill room and dry kiln. The new company is capitalized at $50,000, and will engage in the manufacture of automobile bodies.

Webb Jay Steamer Appears.—Webb Jay appeared on the Chicago automobile row a few days ago at the wheel of a 1909 Webb Jay steamer, which looked good to many of the experts. He has disposed of his entire allotment of Stanley steamers and Kisselkars, and will devote much of his time to the interests of his new production.

Gun Makers in Line.—The Driggs-Seabury Ordnance Corporation, of Sharon, Pa., has decided to go into the manufacture of automobile parts, especially pressed steel work. Ground will soon be broken for a $50,000 addition to the present plant, to be devoted to this branch of the business. Employment will be given to about 75 skilled men.

Franklin "Farthest North."—A party from Conneaut, O., recently made a run to their summer home at Dorset, Ont., in a Franklin automobile, penetrating far into the Canadian forests. The last part of the journey was made over mere tracks in the woods, through country never before traversed by an automobile.

Atlas Builds Addition.—The Atlas Motor Car Company, of Springfield, Mass., has just let the contract for the erection of a new building 150x50 feet, three stories in height, which is to be completed by October 1. Considerable new machinery will be installed.

Packard Addition Progressing.—Work is progressing rapidly on the addition to the Packard Motor Car Company's plant at Detroit, Mich. When the new buildings are completed they will give the factory an additional area of 150,000 square feet.

IN AND ABOUT THE AGENCIES.

Cork Inserts.—The Standard Brake Company, formerly of 101 West Sixty-sixth street, New York, which has for several years assisted the National Brake and Clutch Company in negotiating licenses with automobile manufacturers to use cork inserts for automobile purposes, has retired from business owing to death and changes in the personnel of the company, and all further communiations regarding the use of cork inserts in clutches, brakes or pulleys should be sent to the patentee, the National Brake and Clutch Company, 16 State street, Boston.

Winton.—Owing to the development of Winton trade in Minnesota since Johnny Johnson took charge last spring rendered the temporary quarters altogether inadequate and forced the company to look about for a new situation, with the result that the Minneapolis branch will soon be housed in its new building on Eighth street north, near Hennepin avenue.

Gyroscope.—A. L. Kull has just occupied a four-story brick building on Fifty-fourth street, west of Broadway, and will make it the New York headquarters of the Gyroscope Automobile Company.

Thomas.—Announcement has been made that the Walden W. Shaw Company has relinquished the Buffalo, N. Y., agency of the Reo and Premier and taken on the Thomas Flyer.

Warner Autometer.—W. H. Halliwell, who has the Los Angeles agency for the Warner Autometer Company, is making preparations to establish a branch in San Francisco.

Chalmers-Detroit.—Frank J. Fanning, formerly of the Chicago firm of Levy and Fanning, has been appointed agent for the Chalmers-Detroit in Indianapolis, Ind.

Pierce-Arrow.—The Foss-Hughes Motorcar Company, which has the agency for the Pierce-Arrow in Philadelphia, is preparing to open a branch in Baltimore.

Pope-Hartford.—The Crescent Auto Company, of Jersey City, N. J., has been appointed agent for the Pope-Hartford in northern New Jersey.

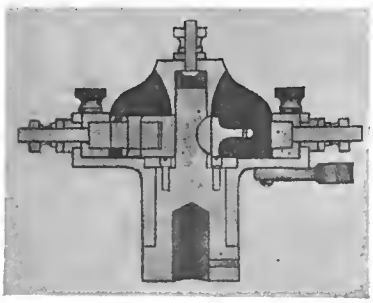
PERSONAL TRADE MENTION.

L. A. Hopkins, for some time past manager of the St. Louis Car Automobile Company of New York, which is the metropolitan branch of the St. Louis Car Company, builders of the American Mors, has severed his connection with that concern, his resignation having taken effect at once.

C. H. Gage, who for several years past has been the manager of the Cleveland branch of the Fisk Rubber Company, has been promoted to the assistant sales-managership of that company, and left yesterday to take up his new duties at the factory at Chicopee Falls, Mass. Mr. Gage is succeeded in Cleveland by C. H. Collins, formerly manager of the Denver branch.

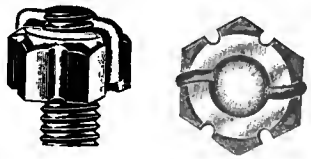
INFORMATION FOR AUTO USERS

Roberts Timers.—That well-known firm of electrical instrument makers for automobile use, the Roberts Instrument Company, 56 Shelby street, Detroit, Mich., has recently placed on the market a line of timers for both marine and automobile service. The instrument is simple and reliable, besides being very well built, solid brass being employed for the case while the bearings are of the finest steel. This, together with the extra length and bearing surface of the shaft sleeve, insures permanent alignment and makes the timer very durable. The illustration shows a sectional view of the Roberts timer, from which an idea of its simplicity and the small number of parts necessary may be gained. The timer is designed to operate clockwise, but should the requirements of the case make this out of the question, it is easy to reverse its direction of rotation merely by removing the brush and inserting it so that it will run in the opposite direction. This makes it adaptable to any motor without any trouble. For automobile use it is made in two sizes, three and four inch, the latter being intended for the heaviest service, while the smaller one is intended for light cars. The marine timer is equipped with quadrant and lever as well as a ground wire attachment.



SECTIONAL VIEW OF ROBERTS TIMER.

Victor Lock Nut.—One of the chief causes of trouble on automobiles of earlier days was the constant loss of parts, small in themselves, but often of vital importance to the machine, which loosened up and dropped off owing to the constant vibration and shaking. To remedy this source of difficulty, innumerable methods have been devised of locking nuts and bolts in place but many of them have fallen far short of accomplishing the purpose for which they were devised. Realizing the shortcomings of many of the lock nuts on the market, the Walker Brothers Company, 21-25 Walton street, Syracuse, N. Y., brought out the Victor lock, two views of which are shown by the accompanying illustrations. Among its advantages, the makers cite the following: "It is a positive lock between the bolt and the nut; it is locked easier than a castled nut; has possibilities of adjustment possessed by no other positive lock nut as it is locked after the nut is home in its place; it can be unlocked, adjusted and relocked without removing, and it can be removed without injury to the lock or bolt; it is a time saver in assembling and can be manufactured at less cost than any similar positive lock." As shown by the cuts, it does not depend upon a spring or compression for its action, nor is an extra nut necessary. When in use there are no protruding prongs and no cotter pins sticking out.



VICTOR LOCK NUT AND ITS FASTENING.

Victor Clutch Compound.—Very often an apparent loss of power that the motor is apparently responsible for may be traced to a slipping clutch, and there are few things more aggravating than to have the car slow down on hills or where the going is hard, merely because the clutch fails to transmit the power to the rear wheels. Everything imaginable has been tried by autoists to overcome this tendency, but few of the substances employed have the desired effect for any length of time, or tend to improve the condition of the leather facing of the clutch. An expert repair man, after considerable experimenting, discovered a compound which would do the work, and after having put it to hundreds of tests it has been put on the market as the Victor clutch compound and is being manufactured by the Victor Clutch Compound Company, Nashua, N. H. It has proved its merits for this purpose conclusively and is also well adapted for other uses where friction surfaces come together, as in brakes, motorcycle belts and the like. It is put up in oiler top cans and being a liquid is convenient to apply exactly where it is wanted.

VICTOR CLUTCH AND BRAKE COMPOUND.

Dayton Airless Tire.—As its title indicates, this is a tire designed to do away with the use of compressed air, and accordingly to eliminate the numerous worries and troubles attendant upon the use of the pneumatic. So far as its external appearance is concerned it closely resembles the ordinary pneumatic, but there the similarity ends. Instead of the usual air tube, there are a number of columns of rubber, made of different strengths and thicknesses and placed at different intervals in proportion to the weight of the car the tire is designed for. The tire is built over a steel core or mold, and all cured in one operation, hence there is no danger of the columns separating from the outside walls, as they are integral with the outer covering. When the tire is taken off the form it is ready for use. In order to prevent sagging or depression between these reinforcing columns and to further strengthen the tire, the fabric is brought down and caused to form a continuous rib. The Dayton Airless tire is the product of the Dayton Rubber Manufacturing Company, Dayton, O., and tests made for the manufacturers by C. F. Adamson, M.E., show that the resiliency of the Dayton Airless Tire is on a par with that of the pneumatic, with the exception instead of compressed air being displaced rubber is displaced and, as in a standard 34 by 4-inch tire, there is 11-2 inches between the columns, there is plenty of room for expansion and the absorption of obstacles met with, exactly the same as occurs in the pneumatic tire. The principle is the same except that the action is mechanical instead of pneumatic. The many users who have tried the Dayton Airless tires are enthusiastic in their praise as shown by a number of testimonials printed by the makers, and it has been shown that these tires have run 20,000 miles without repair and are still in good shape. They may be retreaded in exactly the same manner as a pneumatic, making them good for another lengthy period of service, in fact, until the tread is entirely worn out.

DAYTON AIRLESS TIRE.

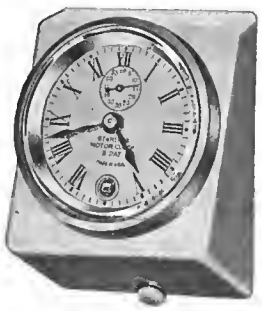
Autogas Tank Box.—It certainly seems strange that in the great improvement that has been brought about in the appearance of a car, no one has thought of providing the compressed acetylene gas tank with a cover that would be ornamental as well as affording it protection. The Avery Portable Lighting Company, Milwaukee, Wis., has just brought out something of this kind, which they term the "Autogas tank box." It is made of pressed steel finely finished in enamel, so that when applied to the running board, it not only harmonizes with the other fittings of the car, but also serves to protect the tank from corrosion, as well as holding it securely. Recesses are cut at one end of the box to accommodate the gas outlet, while at the other an opening reveals the pressure gauge. No straps or other fastenings are necessary. By opening the lid of the box the tank may be lifted out and a new one inserted.

AUTOGAS TANK BOX AND CONTENTS.

Remy High-tension Magneto, Type L.—This is a new type of magneto recently placed on the market by the Remy Electric Company, Anderson, Ind., and it has already met with a very large demand on the part of manufacturers of light and medium powered cars. It is designed with a stationary winding which greatly simplifies construction and eliminates moving contacts in the primary circuit, an objectionable feature that is responsible for a very large percentage of all the trouble caused by the ordinary type. This winding consists of a simple coil of No. 18 B. & S. magnet wire embedded in the pole pieces of the magneto, the rotor, or inductor, consisting of a simple forging mounted on a solid steel shaft. At each half turn of this rotor the direction of flow of the lines of magnetic force is alternately reversed, inducing in the coil two electrical impulses, or current waves, for each revolution. The magneto winding is direct connected through the magneto circuit breaker with the primary of the spark coil used in the magneto. The current wave lasts through fully 45 degrees of the rotor's revolution, during which time the circuit is mechanically broken. Timing is accomplished by shifting the circuit breaker round the armature shaft, to which is attached the circuit breaker cam, and owing to the nature of the current wave, which is an abrupt rise and fall, a long timing range is afforded at practically the same current value. The distributor is geared so as to deliver a spark to each cylinder of a four-cylinder motor during two complete revolutions of the crankshaft. So that the magneto is geared to run twice as fast as the camshaft. In the case of six-cylinder, four-cycle motors, the magneto is back geared in the ratio of one to three, so that it runs three times as fast as the camshaft, or one and a half times as fast as the crankshaft. With the two-cylinder, horizontal-opposed type of four-cycle motor, there is no distributor necessary, a single cam being furnished, thus causing but one electrical impulse per revolution of the inductor, and the magneto is run at the same speed as the motor. The special spark coil furnished with the magneto is fitted with a two-point switch, so that either the battery or magneto may be used, or to disconnect from either to stop the motor. It is also provided with a push button so that either a four or six-cylinder motor may be started from the seat with the lever on the battery side. The batteries are only employed for starting, the current being sent through the coil and distributor of the magneto, although the latter proves very reliable for starting, so that the real function of the battery is to act as an emergency relay, for which purpose it is primarily adopted in this outfit.

REMY HIGH-TENSION MAGNETO, TYPE L.

Sterling Motor Clock.—This is one of the scores of specialties pushed by the Post & Lester Comoany, Hartford, Conn., and is being offered as something radical in clocks selling at a moderate price. The mechanism is of the eight-day type, and is enclosed in a heavy brass offset case, the latter measuring 3 1-2 inches across, while it is 4 inches high vertically, measured across the back, or place where it is designed to be attached to the dash, while its depth at the lower part is 2 3-4 inches. The silvered dial measures 3 1-4 inches in diameter, and is protected by a heavy beveled crystal which screws over it. As the winding aperture is under the crystal, the entire mechanism is well protected against dust, mud or rain. An ingenious attaching device is provided which makes it impossible for anyone not in possession of the key to remove the clock from the dash. A good idea of its appearance may be obtained from the accompanying illustration.



A FOST & LESTER CLOCK LEADER.

The Emergency Wheel.—This is the product of the Black Manufacturing Company, 118-120 West Wayne Street, Fort Wayne, Ind., the New York sales agents being Keeny & Mason, Broadway, Fifty-seventh and Fifty-eighth streets, in the Thoroughfare Building. It consists of a substantial steel rim with two stationary clamps and two adjustable clamps, the former being placed over the regular rim, the car then being pushed forward, causing the adjustable clamps to take hold also. It is then only necessary to tighten two thumb screws, and as the latter are beveled sufficient leverage is obtained to make it easy to tighten them without the use of a wrench or other tool, and they will not jar loose. As will be apparent from the accompanying photograph showing the Emergency wheel in service, the device is very simple and substantial and saves the trouble of removing the old tire which has suffered damage, as well as the annoyance of having to inflate the new one. It is made in sizes ranging from 28 by 3 inches up to 36 by 5 inches.

EMERGENCY WHEEL AS USED ON A CAR.

Warner Tire Valve.—The Warner Instrument Company, Beloit, Wis., makers of the Warner Auto-Meter, have just placed on the market an automatic air valve which should do much to allay the autoist's inflation troubles. It is an extremely simple little device and the makers claim that with its aid it is possible to fill a four-inch tire to the proper pressure in fifteen seconds. It is automatic and positive in action, closing and opening instantaneously, and as it is free from springs and other small parts it is not liable to derangement. By simply pressing it against the valve on the tire the outlet is opened and a second valve nearer the tube is automatically closed, completely preventing the slightest leakage when not in use. The greater the pressure the tighter the valve will hold.

THE NEW WARNER TIRE VALVE.

The 3 in 1 Tire Valve Tool.—The three parts from which this device gets its name are a slotted end to remove the valve "inside," a die to run over worn or hurred threads on the outside of the valve stem, and a tap to clean out the threads on the inside. It is handled by the Auto Novelty and Supply Company, Providence, R. I.

THREE-IN-ONE TIRE VALVE TOOL.

Innerseal Puncture Repair.—This is something radically different from the usual substances that have been placed on the market hitherto for the purpose of repairing a puncture in a tire from the inside, in that it does not consist of a liquid preparation of any kind, nor is it merely a shoe or similar device. The makers guarantee it not to loosen plugs in bicycle tires, also that it does not prevent vulcanizing the repair subsequently, that it will not injure the rubber and that it will positively mend any reasonable sized puncture. It takes the form of a silver flake and is made and marketed by the Innerseal Manufacturing Company, 321 Frankfort avenue, N. W., Cleveland, O. It is covered by patents.

VOL. XIX NEW YORK—THURSDAY, AUGUST 20, 1908—CHICAGO No. 8

THE AUTOMOBILE

THE most enjoyable season of the year for touring is close at hand, and thousands of people all over the country will start out for a week's or a month's vacation on the road. All those who toured last year will do so again—that goes without saying; and they will have gained from experience, more or less painful, much useful knowledge to smooth their way. Perhaps some of the novices may prefer to rough it the first time, and learn in the same school; but for the majority good advice will not come amiss, and will prove of value when heeded.

First of all requisites comes the automobile itself. A few years ago this might have been made the subject for many pages of wise counsel; but now almost any car of recent date and moderate size may be thoroughly depended upon. The only conditions are the size of the party and the length of the owner's pocketbook. The automobile being selected, we may consider its adaptation to the needs of its passengers; and now, whatever else you may leave behind, never, and thrice never, forget the Cape cart top. It is as necessary for touring as the seats or the floor boards. Folded down, it keeps off the dust; raised, it protects the party from a too ardent sun; with the storm curtains attached, it affords shelter from the most violent rain. Useful also, but not absolutely necessary, are the seat covers often seen; they are cooler and cleaner than the bare leather upholstery. As to glass fronts, opinions differ; it is largely a matter of personal choice. Many people think the sensation of the fresh wind blowing upon one's face is the most delightful of all automobiling. At other times the front is most serviceable.

The average beginner finds the baggage question perhaps the most puzzling of all. It is true that on ninety-nine cars out of a hundred no provision whatever is made for baggage; and on the hundredth that provision usually consists of an angle-iron contraption hung on behind, like a miniature fire-escape. It is also true that most people make the mistake of trying to carry too much, burdening themselves with so many unnecessary things.

One of the greatest joys of automobiling is the opportunity it affords of getting gloriously dirty. As a general rule, the more nearly a party resembles a gang of hoboes, the more they are enjoying themselves. When a man goes on a fishing or camping trip, he packs his old trousers, a flannel shirt, and a much battered hat; but when the same man prepares for his first auto trip, he wants all sorts of fancy dusters, caps, gauntlets and leggings. Caps blow off, and the dusters, gauntlets, and leggings are hot, hotter, and hottest. In reality, the only addition necessary to the fishing or camping equipment is a pair of goggles. Women usually prefer a small, stiff hat, firmly pinned and tied down with a stout veil, to act as a combination hair retainer.

When the would-be tourist has reduced his baggage to the smallest possible dimensions, he should study his car to find where it may be most safely and conveniently placed. Usually the space under the rear seat is left vacant and is denominated the baggage compartment; access may be had to it by lifting the seat cushion or by letting down a door behind. However, these openings are often several inches smaller each way than the "compartment," so that all the available space cannot be utilized. In this case the construction of the body should be studied. It may be found possible to remove the rear door and enlarge the opening; a specially shaped hamper may then be put in, projecting a foot or more out on the "fire-escape." A tarpaulin should

John W. Kern, Democratic Vice-Presidential Candidate, in a Haynes.

be lashed over the projecting end, and the whole firmly strapped in place. If there is ample space in the tonneau between the front and rear seats, some baggage may be carried inside. The women of the party may be more comfortable with a suit-case or two arranged as a foot-rest. All baggage carried in this way should be securely strapped down—and it is often surprising how much strapping that means. On other cars the foot room is so limited that any encumbrances become a positive torture. As a last resort, boxes may be carried on the running boards.

Maps and route-books—including the "Blue Books"—are so plentiful and—usually—so good, that no trouble will be experienced on that score. Small towns often confuse the tourist, as their streets are rarely signposted, and the directions of the natives are never very clear. Ofttimes a boy may be found who, for a dime and a seat on the running board, will be only too glad to personally conduct the party through and set them on the right road at the other side. On a cloudy day when the sun cannot be seen a compass is invaluable; knowledge of the general direction to be followed will enable one to choose the right way at an unposted fork or cross-roads. Care should be taken, however, to find whether the compass needle is deflected by the iron and steel mechanism of the car. When putting up at a hotel, or leaving the car at a garage, always ask the price beforehand; otherwise the morning may bring disenchantment.

Accessories Are Many in Number.

The mechanical equipment and accessories of the car form the broadest part of the subject, and, like the car itself, depend mainly on the length of the owner's pocketbook. Shock absorbers improve the riding qualities of almost every automobile, but are expensive for those who must count every dollar. In their absence, four good stout straps, arranged as on a buggy to limit the downward movement of the axles, will sometimes answer fairly well. The speedometer is a fitment which adds interest, though it won't help much if one falls into a police trap, and, so far from being a check on speeding, it is often a temptation. On the other hand, if a route-book is used, some kind of an odometer is almost a necessity. The horn should be looked to before starting, as there is nothing more irritating or, ofttimes, more dangerous than a hooter that refuses to hoot.

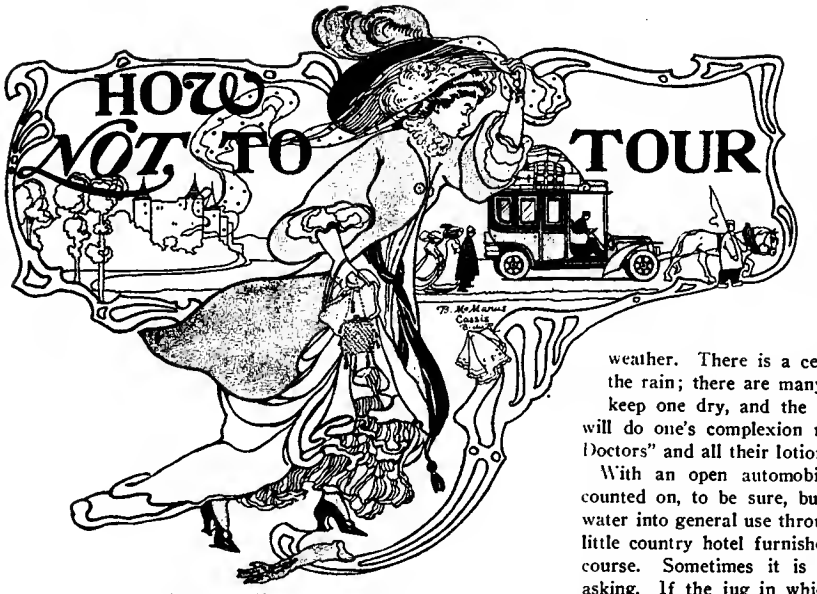
Carry a Couple of Spare Shoes.

On a tour of any length it is always advisable to carry a spare tire shoe or two if the front and rear tires are of different sizes. How to carry the shoe, however, is often a puzzling question. Many people have brackets to hold them outside the levers at the driver's seat; but that seems a very crude arrangement. The levers alone never completely block up that side, and it is very convenient for the driver to be able to get in and out there, without having to climb over the passenger on the other front seat. If the luggage carried on the rear of the car does not project too far beyond the back of the seat, the shoe may be strapped on there; or it may be fastened on the back of the front seat, inside the tonneau. It should always be fitted with a water-proof case; a round, flat leather box may be obtained to fit inside it to carry spare inner tubes and other small articles. A robust jack and a strong-lunged pump should not be forgotten; do not be satisfied with any old cheap bicycle affair.

Master Warren Alexander, a Three-Year Pilot of Rahway, N. J.

Among many other small conveniences may be mentioned a collapsible water bucket; a graduated stick to measure the gasoline in the tank (if no gauge is provided); chamois for straining gasoline; chains for the rear tires; a couple of manchons, or stout leather patches with lacings for binding over weak spots of the tires; an ammeter or voltmeter, according to whether the car has dry batteries or storage batteries for ignition; an oil gun that can be worked with one band; a sharp-pointed tool for cleaning acetylene burners, and small scissors for trimming the oil lamps. Insulating tape and wire often come in handy, and a package of chewing gum will be found a true blessing in disguise in case the gasoline piping springs a leak. Whether a man owns a 60-horsepower six-cylinder or an ancient one-lunger, let him bring it forth and spend his vacation a wanderer on the highways; no man can tell the pleasures that await him there until he has tried it for himself.

In Front of the Hotel Del Monte, Del Monte, Cal., During the Recent Run of Mitchell Car Owners.



By BLANCHE McMANUS.

AUTOMOBILE touring for women is not all fancy clothes and veils. The most luxurious limousine ever turned out, with its soft cushions and plate glass windows, will not keep one wholly free from dust. The best of chauffeurs will leave trickles of gummy oil in unexpected places, to be swept by dainty gowns, and high-heeled shoes are not ideal footwear for those unhappy days when one tramps through the dust or mud to the nearest village, while a farmer's plough horse drags a stubborn machine to shelter, and a mechanician, who more than likely is nothing but the local locksmith, does his best at tinkering.

Automobile touring, in its best phase, is a glorified vagabondage, and to be thoroughly enjoyed and appreciated must be approached in something of the spirit of the rollicking, singing vagabonds of old. The luxurious superfluities and excrescences that handicap modern travel should be lopped off and simplicity should ever be the order of one's going. The open road, the open mind, and the open automobile are the three things needful for the ideal tour.

Map reading is an accomplishment especially recommended to the woman of the automobile party, for an intelligent comprehension of the map of the region through which one is momentarily passing, and some display of feminine tact will do much to smooth the way for the man at the wheel in a strange land, and save him from endangering the lives of the whole party by trying to read as he runs; besides, this helps the women to "star" the beauty spots in her own mind, as does Baedeker in his fine-print pages. Many otherwise intelligent persons never will acquire the ability to properly scan a road map.

Couple with intelligent map study the ability to decipher road signs at top speed. It is thus that a woman can make herself a very useful adjunct to an automobile party, instead of being considered merely as an ornamental appendage, whom man wonders what he will do with when the automobile mysteriously stalls itself by the wayside, as all automobiles are occasionally likely to do sooner or later.

For real pleasurebale touring, by all means the open automobile. Why one should want to ride in a closed-in glass box reminescent of a hearse, and about as airy, is a mystery to those who really love the open road. A Continental corridor railway train is preferable, for it has at least more room in which to move about. As for a cloth or leather hood—what in England they call a "Cape hood" and in France a "Capote Americaine"—in Germany, Heaven only knows what—it, too, blots out the landscape to no inconsiderable extent, and likewise cuts off the free air and produces drafts.

But when we come to consider the matter, why should one be afraid of fresh air? It's the biggest blessing for which the automobile is responsible. Let the wind swish and swirl around you. You may not like it at first, but when once you have the hat that just suits your head, neither too small nor too large, and have taken the right reef in your veil, you will like it the more. Fresh air will do away with the *migraines* more effectually than any number of German "cures." And after you are become used to it you will not even fear bad weather. There is a certain exhilaration, even, in riding in the rain; there are many excellent rain-proof clothes now to keep one dry, and the sting of the rain drops on the face will do one's complexion more good than a score of "Beauty Doctors" and all their lotions and washes.

With an open automobile there is always the dust to be counted on, to be sure, but the automobile has introduced hot water into general use throughout Continental Europe, and every little country hotel furnishes it to automobilists as a matter of course. Sometimes it is offered voluntarily—always for the asking. If the jug in which it is brought is often very small, there is plenty more water to supplement it which will be brought by a willing *garçon* or *bonne*.

If, as has been said, the majority of automobiles are bought at the instigation of a woman, let her pass by the overpowering shut-in *carrosserie* of what is popularly called a "real touring car" (?), with its meretricious charms only suitable for the boudoir, and entirely out of place on the open road.

Of what use in an automobile is an electric arrangement for heating curling tongs, a folding tea table, or a flower holder? If she's doing *real touring*, the woman automobilist will have no time nor appreciation for this sort of thing.

Instead of concerning herself as to whether the color of the cushions suits her complexion, the woman whose husband or father is about to buy an automobile should concern herself more with the efficiency and design of the motor of 10, 20, or 30 horsepower which has caught her fancy. A motor of *marque*, suited to the work which is to be put before it, is of more importance than much gaudy upholstery, and even a superficial acquaintance with its "greasy innards" may enable the woman in the case to be of use to the driver in helping adjust a refractory nut or search out a short circuit when the usually docile man at the wheel becomes a man of wrath.

With the man of the party at the wheel, the exercise and responsibility of their own special character will be as good for him as will be early rising for you. Women can hardly hope, as yet, to compete with mere man for the honors of becoming a good driver and competent conductor of an automobile, which, after all, is something more than merely steering the thing. It is something of an undertaking keeping an automobile in running trim day after day for perhaps a number of weeks, with never the necessity of stopping for repairs. It, too, is a very different thing from "driving" oneself in that kind of a machine where you have only to "turn something," to "push something," or to "pull something," in order to have an airing in the park or a run out to the golf links.

Too Much Baggage Is a Nuisance.

As for baggage en tour: a suit case for each person is all that should be taken. Don't be beguiled into believing that you cannot do without that trunk furnished with all home comforts. The initial idea when planning a tour is to get a change from home comforts—and discomforts—to turn new pages in one's book of experience, and though often they may not be as attractive as those of chapters gone before, still the thing is to turn them all—or as many as one can.

It is hard for the average woman to realize that space on an automobile is quite as valuable for the articles of its own wardrobe as for those uncrushable components of hers. There are inner tubes and envelopes for replacement to be carried, perhaps extra supplies of gasoline and oil, and a whole kit of tools, and things which are never required until one abandons his usual base of supplies. For this reason alone the touring automobile should be as free as possible from alien trappings.

Trunks are to a great extent receptacles for carrying what one does not want, and they have no place on an automobile. We all recall the things that we have many times "packed"—"that we could not possibly do without"—which lay undisturbed in the bottom of our trunk throughout a long tour. The writer remembers once having carried a large trunk in the tonneau of an automobile—it was to head off two grafters—as well as the usual handbags for a month across France, and it was never once opened. Since then hand luggage only has been our rule.

A suit case can be made to carry all that a woman really needs for any tour short of a month; at the end of that time she will usually be quite ready to repose a while, and then it will be a simple matter to connect with her heavy luggage.

A dress of washable silk, three or four blouses, a "sweater," a soft cap, a pair of shoes, and a couple of changes of underclothing, some stocks, and as many handkerchiefs as can be stuffed into the corners, with the necessary simple toilet accessories, can be packed judiciously into the suit case of convention with room to spare.

Don't wear a pet dress. You will be sorry if you do when you discover that the oil can has been mysteriously left beneath your feet and naturally overturned itself. Either this, or you will get a *tache* of gummy grease while you were accommodatingly "handling something," that probably you should have let alone.

One needs fairly warm clothing even for a summer tour. A tolerably thick cloth suit—dark gray or brown in color—made short is quite the best thing for the purpose. Discard petticoats for bloomers of dark silk and you will double your comfort. A cap or *casquette* of heavy corded silk, with a soft stitched and sufficiently ample brim, which can be adjusted to suit the wearer's taste, the kind that French women en auto invariably wear, is by far the best headgear. Comfortable walking shoes should cover one's feet, the "pumps" meanwhile reposing in the suit case. Do away with "Merry Widow" hats, or you will find yourself in the same class with the man whose chauffeur was obliged to pull up about once in every three miles to go back and capture his employer's broad-brimmed "Stetson" which he insisted upon wearing on all occasions.

Clothing Appropriate to the Automobile.

The most appropriate and beautiful costume of one's predilection becomes commonplace and tawdry when seen out of its proper time and place, and very few varieties are suitable to automobile touring. Nothing is so becoming as a costume that is appropriate to the occasion. The man or woman automobilist of to-day is not the hideously costumed creature of a few seasons ago.

As to veils, they are a matter of individual preference. A silk hood, after all, is more protection for the hair against dust than many veils, and answers better in every way. Do without a face veil, too; wear a pair of good goggles, neither too large nor too small, and, above all, not too heavy, and preferably of a slight smoky glass. Goggles, even, can be done away with a good part of the time, when the wind is not strong and when the dust is not swirling about. This is another one of the benefits of fresh air; a good way of strengthening one's eyes.

One will get sunburned riding in an open automobile, there is no doubt about that, and wind-tanned, perhaps even freckled, and perhaps even you may "peel," but all these things are what many women pay money to acquire in other ways at some pseudo-fashionable resort, and anyway, if any or all of these things come to you, they will only be the means of convincing your friends that you have had a good time, and make them long for such on their own account.

Wear always a dust cloak that is also rain proof, with a hood attached which can be pulled over the head in case of a hard rain. If you cannot buy such a one when you come to get your outfit together, have it made. In the British Isles one needs a warm coat at any season of the year, and it will be found prudent to have one by one anywhere, for the European climate is changeable enough to make frequent protection necessary.

Have deep, mannish pockets in your coat; into one of them a folding kodak can be slipped. Wrist bags should be discarded; carry nothing in your hands; one does not want to be obliged to spend time that might otherwise be profitably employed hunting for objects on the floor boards of an automobile that ought never to have been there.

Such a wardrobe as outlined above, or some corresponding amount of wearing apparel, not more, is all that is really necessary for one's well-being and comfort en tour.

If the laundry problem becomes insistent, consult the map and pick out an interesting place at which to stay over twenty-four hours. Washing can be done anywhere for the traveler in a few hours if necessary, and if judiciously arranged for betimes.

Beware of Unnecessaries.

Don't lay in a stock of soap and tooth powder, etc., as if you were about to take a journey through wildest Africa. Most tourists, and women tourists in particular, pack their trunks and bags as if it were not possible to purchase anything en route. Good, well-stocked shops are plentiful in all towns along the touring roads, and there are few little villages that have not something which corresponds to a "general store" where, as they say in England, one can, on a pinch most pressing, add to the necessities of their paraphernalia.

Automobiling is a pretty good cure for most ills. Rushing air, unwonted exercise (and you get more of this on an automobile than is commonly supposed) and an occupied mind will often do away with the need for one's favorite remedies.

Men, as a class, are born travelers; women, as a class, have to acquire the art, and in many instances the results do not seem to have justified the exertion necessary.

If "three generations are needed to make a gentleman," three tours—and often more—are needed to make a good traveler of the average woman. This is not saying that she lacks capacity for enjoyment or delicacy of perception. It is only that she is less adaptable to change than man. The pleasurable distractions of new scenes are, for her, so often marred and distorted by the unusual, and, not infrequently, uncomfortable conditions under which they must be viewed. To be cut off from the little conveniences and comforts of their daily lives, as must often happen en tour, is a source of real or fancied hardship to most women travelers, and this is undoubtedly one of the reasons why so many of them prefer to do their touring abroad in the environs of the great capitals and in close proximity to the big shops rather than brave what seems to them the many deprivations and discontents of the open road. That forcing house of modern luxury, the big transatlantic liner, too, is a bad preparation for bridging the differences which do exist between American and European ideas of comfort. It but helps to intensify the shocks which the average feminine automobilist gets when she first starts out on her search for the picturesque along the highways and byways. The best preparation for touring is to cultivate the habit of the open mind; accommodate yourself to your surroundings rather than try and change them. Women are too prone to think that their way is only smoothed for them by the lavish expenditure of money on the part of their male relatives. Something besides money talks, fortunately, when touring in France. Little politenesses count for much among the older nations, often for quite as much as the indiscriminate throwing around of coin, though it may be difficult to convince some of this. The average person abroad who caters for travelers is not nearly so grasping, if approached in the right way, as is commonly supposed. So scatter a few smiles and appreciative words along with your louis, francs, and sous, and those who follow after will fare the better.

Popularity of Americans with European Touring

PARIS, Aug. 10.—It was while sitting at the terrace of a popular Parisian café, engaged in that essentially French triple occupation of sipping, gazing, and idly chatting, that the realization came that European touring had undergone a serious change during the past two years. Instinctively, as the result of long practice, the writer's eye was following the interminable procession of taxicabs, touring cars, heavy limousines, and dainty town vehicles that almost monopolize the Rue Royale during the afternoon. Suddenly the file of cars from French, Italian, and German factories was broken by the appearance of a Packard, a 1907 touring model, containing a party of Americans, evidently touring France. Five minutes later a Pierce had gone by, and almost on its heels was an old gentleman driving a White steamer. Before the drink was finished a Peerless touring car and a little Ford runabout in the hands of a demonstrator had skimmed along in the dense stream of traffic, making five American cars in a period of a quarter of an hour.

Even so recently as two seasons ago it would have been impossible to have seen in any part of Paris at the commencement of the touring season such a number of American cars within such a short period. As there has been practically no change in the selling situation, Ford having come into the field, and but one other maker having gone out, the obvious conclusion was that Americans are touring Europe in their own cars more extensively than proved to be the case but twenty-four months ago.

Except by getting figures from all the transportation companies it would be impossible to ascertain exactly how many American tourists annually visit Europe *en automobile*. But the interesting phase of the matter is that private owners are now extensively advertising the home construction by bringing over cars from many of the best American factories. It was the invariable rule but a short time ago that American automobilists in Europe should use cars supplied from the crack factories of France and Germany. Probably the number of multi-millionaires who buy a new foreign car immediately on arriving from the States, tour with it for several months in Europe, and either sell it or ship it over to America at the end of the trip, has not seriously diminished.

A new class, however, has been added to this floating population: Americans of rather more moderate means who, owning a good, serviceable touring car, take it with them on their trip abroad, tour with as much comfort and reliability as their countrymen mounted on the foreign article, and return home delighted with their visit and their machine. A casual visit to one of the larger Parisian garages, the "American" in the Avenue Montaigne, found seven American cars one morning not long ago. The same day Fournier's garage had three cars manufactured in the States, and at the Automobile Club of France garage two were in temporary storage. Naturally the number fluctuates considerably, for foreign automobilists are essentially birds of passage, but some idea of the number of American cars passing through Paris may be gathered from the fact that the records of the "American" garage showed a total of 60 for last season, the number being made up of 35 Packards, the rest being largely Pierce and Peerless cars. The Packard agent in Paris was last year in touch with close upon 200 different parties touring Europe in the well-known "Thirty" from Detroit, and had had communication from forty parties up to the middle of May of the present year. Beside a very large number pass through Europe without ever troubling the foreign representative of the car.

Victor Breyer, A. A. A. Representative.

An enormous impetus has been given to touring in Continental Europe by the arrangements made by English, American, and French associations to break down or, at any rate, to simplify the formalities which governments and nature have put in the way of free intercourse. Such French associations as the Touring Club of France, the Association Générale Automobile, and the Automobile Club of France are constantly striving to improve conditions, not only for their own members but with a view to attracting visitors from abroad. There is a lot of detail work, however, which even these admirable bodies cannot attend to, and the gap has been filled by the work of the English associations, and, more recently, by the American Automobile Association. As is now generally well known, every member of the A. A. A. touring in France is entitled to the services of Victor Breyer, the foreign delegate installed at 4 bis Rue Descombes, Paris. There are probably few men in France who have been more closely connected with the sport and industry on this side of the Atlantic or who are so well fitted to assist American visitors with advice on touring, the hiring of cars, the engagement of chauffeurs, or the formalities which are the necessary attendants of a visit to a foreign country.

American visitors largely profit by the excellent foreign touring branches of the various English associations. The Automobile Association, the Motor Union, the

H. D. Wilson, Packard Agent in Paris.

Royal Automobile Club, and the British branch of the Association Générale Automobile, at 166 Piccadilly, London, have all studied the European touring question so thoroughly that their members can enter continental Europe with about as little formality as an automobilist crosses from Manhattan Island to the Jersey shore. Samuel A. Miles, when touring France with a Pierce car, declared that the Automobile Association in London fitted him out so thoroughly before leaving for France that he had not even to attend to his own gasoline tank. At the present time an arrangement is under consideration by which the members of the A. A. A. can have full benefit of the Automobile Association touring bureau, not only in London but in all such ports as Havre, Cherbourg, Boulogne, Bordeaux, Marseilles, Dover, Folkstone, Newhaven, Southhampton, Plymouth, etc.

By the aid of these various associations all the formalities such as registration of car, obtaining of driving licenses, payment of custom duties, can be settled before leaving England. On arrival at the foreign port practically all that remains to be done is to attach the license pads, have the triptyque signed by the customs officer and drive away. Further, officers of the Automobile Association, the Association Générale Automobile and the Motor Union are in attendance at the French ports.

Though in the present perfected condition of the automobile a machine can undertake a foreign voyage with every hope of being independent of the factory or repairmen, occasions do arrive either by reason of accident or otherwise, when it is convenient to obtain spares without sending over the Atlantic for them. It is for this reason that the Packard Motor Car Company and the George N. Pierce Company of Buffalo have each opened a Paris depot for the convenience of their customers touring Europe. At 13 Cité de Pusy, in the Boulevard Periere, Paris, H. D. Wilson, the Packard agent, maintains practically a complete car in parts and is able to furnish any spare that may be required at a moment's notice. During the year that the office has been in operation Mr. Wilson declares that he has not sold enough parts to pay for lighting, a result which amply testifies to the reliability and good workmanship of the Packard.

The office is maintained more as a convenience to customers, for, however serious a road accident they may be involved in, there would be no necessity to wait for parts coming from the home factory. The owner of a Packard touring abroad need never fear being stranded for want of some special part unknown to Europe. A large amount of useful work is also done in planning tours, advising on methods of shipment, custom formalities, and touring regulations.

In October, 1906, the George N. Pierce Company opened its Paris touring bureau and spare parts depot at 22 Avenue de la Grande Armée, in charge of N. S. Goodsill. According to the European representative 50 Pierce Great Arrow cars were dealt with during the season of 1907. The number during the present season has been several times greater. A complete stock of parts is maintained for all models, arrangements being such that spares can be sent off at a moment's notice on receipt of telegraphic advice. Another matter of importance to Pierce owners is the recent establishment of a Paris branch by the Goodrich Tire Company, located in the Rue Brunel, a few yards from the car depot. As all Pierce cars are shod with Goodrich shoes, the arrangement is a convenient one, for these tires exactly fit the rims, and give better satisfaction than the French tires made in metric sizes only.

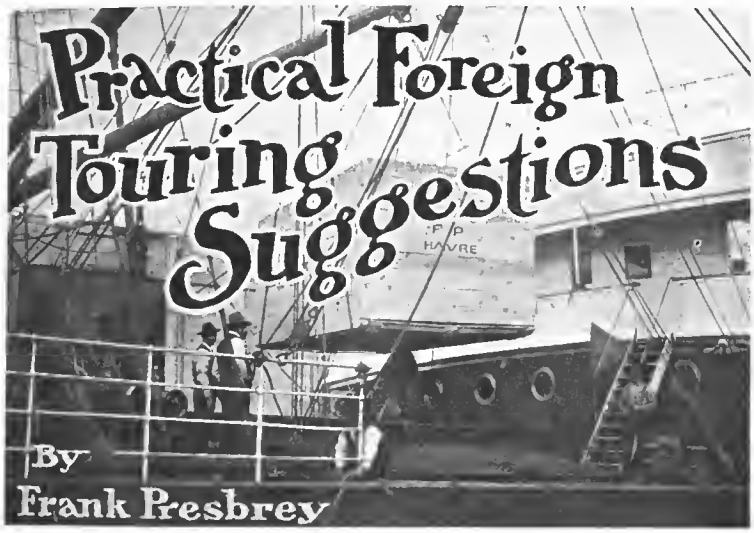
An idea of the advantage to be gained by the use of the tourist's own car can be had from figures supplied by the Pierce agent. A touring car of the size of the Pierce Great Arrow 45-horsepower would cost in France a rental of $30 to $40 per day, even when taken by the month. In addition to this the customer must pay all road expenses: fuel, garage charges, tires, maintenance of chauffeur, and an average tip of $2 per day to the latter. All fear of being stranded for lack of some minor part being removed through these foreign depots, it is no wonder that the number of Americans touring with their own cars is largely on the increase. It is expected that the total number of Pierce cars to visit France this year will be over a hundred.

A Snap Shot in a Popular Parisian Garage Early in May of the Present Year.

The first six cars are owned by foreign tourists, the makers being English Daimler, Peerless, Packard, Pierce, Thomas and Fiat. Note the New Jersey tag on Peerless and the New York license number on the Pierce.

Practical Foreign Touring Suggestions

By Frank Presbrey



Hoisting the Locomobile Aboard the French Liner, en Route for Havre.

IN taking one's own car to Europe there are few annoyances, but the satisfaction in knowing just what you can count on is more than compensation. In the first place, no apologies are necessary when you take an American car. A few years ago the French manufacturers were far ahead of us in construction, style, finish, durability of parts, and dependability. But a few years to an American manufacturer are as a generation to those of other nations. We make progress rapidly, and to-day an American automobile of the best make can be taken to Europe with every confidence that it will stand up to the work just as satisfactorily as the best foreign car.

Those who are contemplating the trip and expect to take over their own cars will find the following suggestions valuable, and the information correct, as far as it goes.

Unless the owner intends to drive the car himself it is best to take over with him his own chauffeur. He can be sent over in the second cabin on the same steamer with the car. If the owner is to do the driving, it is advisable to secure in each country a mechanic who can do the necessary dirty work on the car. But my advice is to take your own chauffeur. It is cheaper in the long run and far more satisfactory. The average foreign chauffeur is indifferent and foolhardy, and, with the French particularly, determined to "burn up" the roads, regardless of your instructions or desires. I met a friend in Tours who had employed a French chauffeur and he told me that "he (my friend) had died a dozen times during the past month" from sheer fright, and that, try as hard as he might, he could not cajole, order, or compel his chauffeur to drive at anything but a break-neck pace at every possible opportunity.

It is important to provide a description of your car, translated into French, if you are going to France or Italy, and into German if you are going into Germany, giving the maker's name, value and style of car, horsepower, number of cylinders and size, wheelbase, number of motor, factory number of car, motor power, weight in pounds and kilos, color, and equipment—that is horns, lamps, etc. This will save time and trouble in passing the customs house formalities. Incidentally it may be remarked that acetylene lamps are prohibited in cities and towns in France. Two side lights are required: the right, white, and the left, green; also rear lamps showing numbers.

Affix a small brass plate to the body of the car upon which is engraved the owner's name, his city and State, and "U. S. A."

Have extra heavy brakes put on the car, unless it is already well-equipped, and, while not necessary, it is advisable to add strong sprags to hold the car should it start to back on a hill. It is well to take with you two or three sets of Weed's chain grips.

If you take over an American car, have its maker pack for you a box containing a duplicate of every essential part, including brakes, which you are likely to have to replace, and which could not readily be made in a repair shop abroad. This box can be packed under your car in the crate and fastened to the bottom of the crate. Leave these parts at some central point from which anything you need can be sent you quickly. Arrange with the manufacturer to be credited after your return with all parts not needed.

Procure five small photographs (size 7-8 by 1 1-4 inches) of chauffeur and yourself if you expect to drive the car, for affixing to licenses in countries other than Great Britain.

Arrange with some foreign shipper—there are several in New York City and Boston—for the shipment of your car. They will take entire charge and you have nothing to do but to turn it over to them and they will have their packer make the crate for it. The charge for a heavy crate, put together with bolts so that it can be taken apart in sections and held for use in returning the car to America, is $50 for the ordinary touring body and $60 for a limousine or other closed type of automobile.

The charge for trucking the packed car to the ship is $10; charge for derrick used in loading on this side $12 (no charge for loading is made on cargo boats on crates weighing less than 4,400 pounds), and unloading and dock fees on the other side $10 to $15. To these amounts there is to be added the cost of freight and a charge of $10 made by the shippers for their services. The freight charge varies, of course, according to the port of shipment and character of ship on which the car is sent, whether express or cargo steamer.

It is advisable to make sure that the boat on which your car is to be shipped has hatchways sufficiently large so that the crate may be put into the hold and raised out of it without tilting. Be sure you have a marine insurance policy covering your car in transit. The shipper will procure this for you; and also have him turn over to you for use with the custom officials upon the return of your car the original shipping manifest from

French Signboards Are Numerous and Informing.

The information contained in this article is taken from "Motoring Abroad," written by Frank Presbrey, and published by the Outing Publishing Company, New York City.

When One Crosses from France to Great Britain.

America to Europe. This manifest should describe the car fully, factory number, date of manufacture, maker's name, etc.

If you are going to France turn over to your shippers two or three weeks in advance a typewritten copy of the description of your car, retaining a copy yourself, and five small photographs of whoever is going to drive; a "Driving Certificate" must be procured for each from the French authorities. Your shipper will arrange to secure the certificates as well as the necessary "Circulation Permit," which corresponds to our State license. The shipper's representative at Havre will have the necessary official at hand when the car is unpacked and ready to be turned over so that the examination of the driver to determine his ability may be had without delay. This examination generally consists in taking the official around a block or two, the passing of a few salutations, and the judicious extending of a tip of from five to ten francs.

The shipper will also attend to the paying of the customs, the amount being placed in his hands for the purpose at the time of shipment. The average customs deposit in France amounts to about $175 on a touring car and $200 on a limousine. The amount is figured upon weigbt and the entire sum is returned at the port from which the car is shipped out of the country, if shipment is made within one year. To secure this refund it is absolutely necessary to present the customs receipt issued by the officials at the port of entry, therefore do not lose it.

If you enter France from England, arrange all the details of customs, licenses, etc., through the Motor Union of England, reference to which is made elsewhere. This will save much trouble and annoyance and a great deal of time.

The customs duty in Italy must be paid when the car enters the country. A receipt is given and the amount returned when the car is taken out of the country. A lead seal is affixed to the car and must not be disturbed. The average duty is about $120 for a car of the touring type.

In entering England no duty is charged and the freight to England is less than to France. The three chief English ports are Liverpool, London (docks at Tilbury, eighteen miles from London), and Southampton. The preference lies with the latter two.

If you have taken over an American car be sure, before returning, to go to the United States Consul at the port from which you are to ship and make a declaration before him regarding the car. This is essential to facilitate passage through the customs house on return to the United States. This declaration should contain the material facts regarding the car, including its factory number, motor number, maker's name, etc.

If your car is of American make you must detach from it before shipment back to this country any horns, sirens, clocks, or other fixtures you may have purchased abroad, and ship them separately. The customs officials do not pay any attention to foreign tires which are on the car if they have been used to a reasonable extent, nor do they demand duty for minor necessary repairs up to 10 per cent. of the original cost of the car.

It is essential to take a passport with you. This may be procured readily from the State Department at Washington upon payment of a fee of one dollar, and in case of any legal proceedings or an accident abroad it is important to bave one.

Bear in mind while touring abroad that foreigners attach much more importance than do Americans to politeness, and when you are in Rome do as the Romans do. A pleasant smile and an agreeable manner go farther in most foreign countries than a tip. And never lose your temper.

If you are not already a member of tbe American Automobile Association, or some well establisbed automobile club, join before you go abroad. The fee for joining the American Automobile Association, whose offices are at 437 Fifth avenue, New York, is only $2. Application should be made to the secretary of the association, and this can be done in person or by mail.

It is also essential that you should join the Touring Club de France. This organization has over 100,000 members and is very powerful, being under the direct patronage of the French Government, and having a board of governors composed of many distinguished men. The wearing of the club button on your cap insures attention anywhere in France. It costs but six francs ($1.20) to become a member and many Americans are already on the club's roll. A simple application for membership made to the club at 65 Avenue de la Grand Armée, Paris, is all that is necessary, except the payment of six francs ($1.20), with an additional charge of 50 centimes (10 cents) for postage, or $1.30 in all. The club issues a year book containing a list of 3,000 selected hotels, at which all members, upon showing their card, secure a reduction of from 5 per cent. to 10 per cent. in their bill (a considerable item when one is touring). This item alone saves the cost of membership many times over. The club issues maps, and an infinite number of descriptive pamphlets, giving information as to hotels, police regulations, customs laws, etc., besides more than 300 card itineraries with sketch maps, and a dictionary in six languages of such phrases and words as would be of use to a motorist. The club will upon application make up special itineraries and facilitate a foreign tour in many ways.

If you are going to tour in Continental countries other than France, you can secure through the club a *triptyque* which will relieve you of all the details regarding duty and even the payment of it in the various countries you may visit. The application for a *triptyque* is made on a prescribel form and must be accompanied by a deposit of the amount of duty which would be imposed by each of the countries to be visited. The *triptyque* is issued under the authority of the club which becomes responsible for its members during their sojourn. If one is to tour in France only and does not expect to enter other countries on the Continent, the *triptyque* is unnecessary. Its chief convenience lies in the fact that it avoids the necessity of dealing with the customs officials at the ports of entry and departure. It is not necessary in taking a motor car to England as no duty is exacted in Great Britain.

Those who are going to tour in Italy should join the Touring Club of Italy. Its headquarters are at 14 Via Monte Napolene, Milan. Membership costs 10 lire ($1.94) and is very helpful. The club offers most of the facilities afforded by the Touring Club de France.

If you are going to tour Great Britain join the Motor Union of Great Britain and Ireland, which corresponds to the Touring Club of France. Membership, which costs one pound one shilling ($5.25), can be procured in advance of reaching England by application to the secretary, No. 1 Albemarle street, Piccadilly, London, W., with a remittance covering the fee named above. This organization is very helpful and membership therein desirable in that it will secure discounts from the customary prices charged at many hotels. It also assists members in any legal complications, in shipping cars to France or other European countries, in securing insurance. et cetera.

INFLUENCE OF HEAT TREATMENT ON STEEL*

By THOS. J. FAY, President Society of Automobile Engineers

STEEL, no matter what its chemical composition or mode of fabrication, is rendered soft or hard, and otherwise altered in its texture, if it is "heat treated." It is of course understood that the extent of the changes that can be brought about by heat treatment will depend upon the composition and the other characteristics of the steel. It is also true that skill and the facilities used for treating the steel will greatly influence the results. It is proposed, in this chapter, to go into this matter at some length, and the endeavor will be to show the various ways in which the several grades of steel used in automobile work may be rendered best fitted for the work. An attempt will be made to set down all requisite data for the benefit of those who have every facility without neglecting engineers who may not care to pay the cost of all the necessary equipment.

Fortunately, automobile engineers are of that class whose knowledge and experience place them in advanced positions, so that it is unnecessary here to begin with an elementary course. Much of the information might even be abandoned were it not for the fact it is desired to cater to some extent to "artificers" as well as to engineers, and it may be many of them are not in possession of many of the fairly well understood facts in relation to the question of the heat treatment of steel. Even engineers who have not made a specialty of the manipulation of "alloy steel" will find in these pages some cautions and data that may well serve for them, notwithstanding their considerable knowledge of the subject. The reason for this is that "alloy steel" intensifies the expected action, and those perfectly familiar with carbon steel phenomena might be at a loss with other products.

Product Should Be Properly Classified First.

To more clearly understand the situation, it will be proper to point out in what way heat treatment alters the structure of steel, for then it will be possible to understand the advantages to be derived from such a proceeding. If steel is in the normal state as it comes from the maker, it may be desirable to reduce it to some condition foreign to the normal, for some purpose dictated by the service to be rendered. Normally constituted steel is a product, the condition of which seems not to be well understood by many, and it will therefore be desirable to endeavor to qualify on this point. Steel is not always in the normal state as it is received from the makers, so that it is not possible to describe normal steel as the product as it is received. Even though the makers are not in the wrong in any way, it is possible the steel may be in an abnormal state, even if it is ordered as normal. The point to be made here, then, is to fix a distinction as between steel in the normal state, as compared with the product in some one of the abnormal conditions.

Steel may be reduced to the conditions as follows:

(*I*) Normal (Pearlitic)
(*a*) Lamellar.
(*b*) Granular.
(*II*) Normal (The preponderance of Ferrite)
(*a*) Lamellar.
(*b*) Granular.
(*III*) Normal (The preponderance of Cementite)
(*a*) Lamellar (Pearlitic).
(*b*) Granular.
(*IV*) Martensitic.
(*V*) Sorbitic.
(*VI*) Trootsitic.
(*VII*) Austenitic.
(*VIII*) Burnt.
(*IX*) Composite. (Soft core and hard shell.)—Cemented,
(*X*) Conglomerated.

*Extract from Chapter XXI, "Materials for Automobile Construction," By Thos. J. Fay, E. E., to be published by the Class Journal Publishing Company.

This is not to say that all steel can be classified under one or the other of the heads above given; on the contrary, it would be extremely difficult to accomplish such a task in many instances. For this reason it is important to know the history and the chemical composition of a product, before any attempt is made to heat treat it. The condition (*IX*), for illustration, cannot be established if the steel is of high carbon, alloyed or not. The reason for this lies in the fact that if the carbon is high the core will not be rendered soft. The shell will be hard, to be sure, but the core will be hard also and the steel will be rendered non-dynamic as a result. Such a product would be so brittle as to serve no useful purpose at all.

Likewise, the "burnt" structure is due to the fabrication, and the user of the steel cannot correct this structure by any available means. Steel, then, in the state (*VIII*) is not good to use nor can any mode of heat treatment correct this. Many illustrations of the fact that history is important could be given.

Pearlitic steel might be classed broadly as steel holding pearlite; on the other hand it is the purpose here to fix for normal pearlitic steel that product holding approximately .009 per cent. carbon as pearlite. If the steel of this carbon content is not as pearlite, it is not in the normal state. It could still be pearlitic, but it would not be normal pearlitic steel. The classification (*I*) then contemplates the steel of the carbon content stated, holding 100 per cent. pearlite, or very nearly so.

Carbon Content Determines Normal Condition.

If the steel holds less than .009 per cent. carbon, it will be normal, if the condition is that of pearlite and ferrite in the proportions consistent with the total of the carbon present. That is to say (assuming a case in point), if the carbon is .002 per cent., the proportions for normal steel would be as follows:

as 90 : 20 :: 100 : 22.2 pearlite
and,
100 — 22.2 = 77.8 ferrite.

Or, in general, it would be possible to say (for steel holding less than .009 per cent. carbon) the proportions of pearlite to ferrite for normal steel would be:

as 90; points of carbon :: 100 : % pearlite, hence
100 — pearlite = ferrite percentage.

In other words, in normal steel of the class holding less than 90 points of carbon, there should be no condition besides ferrite and pearlite. There is one other point to be observed in this connection before the matter can be settled, viz: the pearlite can be in either one of two conditions as follows: (*a*) lamellar, (*b*) granular. The lamellar pearlite is produced if the steel is cooled very slowly from a very high temperature (annealing process). It would seem, therefore, as if this is not the pearlitic stage likely to obtain in normally constituted steel.

The granular pearlite, on the other hand, is shown as an intimate mixture of ferrite and cementite, the product resulting from a reheating to a low temperature and cooling in the air. This granular pearlite (irregular granular structure) is more likely to be the normal product of the mill than the steel of the lamellar pearlitic condition. It follows, therefore, that it will be proper to regard the condition (*I*) as of the (*a*) or (*b*) stages.

Obviously, not to know the history of the steel is to take great chances in its heat treatment, if the effect of heat treatment is varied with the previous condition. The amount of the actual variation, as a result of the previous condition, really depends upon the composition of the steel, it being the case that products very low in carbon are not so readily effected as those in which the reverse holds true. This latter statement will hold for all genera of steel, alloyed or not.

The pearlite condition can be varied in the products (*II*) and (*III*) as well as in the product (*I*), hence it will be well to

make an (*a*) and (*b*) distinction in these cases also. Beyond these stages, however, the situation becomes too complicated to attempt to maintain a separate classification of the pearlitic stages, since it requires no stretch of the imagination to indicate that there are innumerable stages intervening.

If the carbon is in excess of .009 per cent., normal steel will consist of pearlite and cementite excess, just as in the case of the steel with less than this amount, the excess is ferrite. Considering the higher carbon steel then, it will only be normal if the ferrite excess does not exist and cementite is the sole excess. Certainly it would be far from good practice to treat steel holding a cementite excess in the same fashion as if the excess were ferrite. With the carbon content in excess of .009 per cent., there is the same question of the pearlite condition, and a distinction must be made as between annealed and normal steel. This will be a difficult thing to do in general practice, and it becomes necessary as a rule to depend upon the vendor of the steel, to a very great extent.

If steel is alloyed, the effect of the alloying elements must be taken into account in the heat treatment, and in numerous mixtures the carbon conditions will be found awry. What has been said about the carbon condition holds if there are no alloying elements present, and also to a great extent with some of the alloying elements present, while others serve to alter the carbon condition to an enormous extent, since some of the alloying elements form carbides, as vanadium. Certainly, if carbides are formed, it is not to be expected that the more simple conditions hereinbefore described will still hold true. But this is not the time nor the place to discuss these matters in detail, more than to point out that it will be a fallacy to expect the same results from the same treatment for all grades of steel or for any one grade of steel irrespective of its condition before treatment.

However good the facilities for treatment may be, to proceed without knowing the history of the steel as well as the composition thereof, is to chance spoiling it and to end by having present in the automobile a part of no safety at all. It is plain from what has been said that besides the normal and annealed products there are the other conditions to be taken into account. The martensitic (*IV*) condition is brought about if the steel holds carbon between .002 per cent. and .009 per cent., provided the steel is suddenly quenched from a high temperature. This martensite formation is more completely developed if thin specimens are raised to a point above Ar_1 and suddenly quenched in a suitable cold bath. The question of the appropriate bath for quenching is a matter to be discussed at length at a later time. At all events, it must not be expected that a very complete martensite structure will result from the ordinarily more or less indifferent practice, or if the specimens are of great bulk. If the mass is great, it is not possible to so suddenly bring about the requisite temperature to evolve the martensitic formation only.

Some Conditions Are Only Transitory Stages.

The sorbitic (*V*) condition is a transition between cementite and ferrite, in unhardened steel, or if the steel is hardened, sorbite is the transition between cementite and martensite. A very simple way to bring about this stage is to temper steel in the martensitic stage. It is this sorbitic stage to which many of the important parts of automobiles are reduced to render them fit. The martensite would not be sufficiently dynamic (kinetic) to afford the requisite safety, and in tempering the quenched parts the object is to bring about the sorbitic condition. Of troötsite (*VI*) it may be mentioned that its formation holds between martensite and ferrite, and is a mere transition to be regarded as the product obtainable if the carbon content is approximately .009 per cent. This formation will follow the mild quenching of martensitic formations, or it may be produced in other ways, as when steel of the requisite carbon content is suddenly cooled from the point of "recalescence" It is also likely to obtain if small pieces are oil-quenched, from a temperature above the "critical" range.

Austentite (*VII*) is the product of suddenly cooled steel if the carbon content is quite high—.015 per cent., although more or less of the austenite formation will result even if the carbon content varies over a considerable range. The quenching temperature should be about 1,050 degrees C. for the austenite production, this being higher than the usual quenching temperature. The austenite formation is not easy to distinguish nor is the carbon condition well enough defined to enable metallurgists to say much about it. The austenite is softer than the martensite surrounding it, and if ammonia nitrate is used as an etcher, the austenite does not color as does the martensite.

Burnt Steel Is Not Wanted for Any Purpose.

The "burnt structure" is the least desirable of all; indeed, it is not wanted at all. (*VIII*). This is the structure in which the grain formation is broken up, the separating media consisting of oxides. There is no heat treatment that the author knows of that will reduce the oxides, hence this formation is quite worthless, since burnt steel has no value in structural work of any responsibility. Nor does any authority attempt to say in what way burnt steel can be rendered free from the damaging oxides that render the steel brittle and unreliable.

The author does not understand that steel will be burnt in the act of heat treating, since the burnt structure is that peculiar to the process of fabrication under certain conditions, described elsewhere. There is a crystalline structure that is arrived at in heat treating that is frequently said to be a burnt structure, but it can be corrected in most cases where a suitable process is skillfully employed.

The composite (*IX*) formation, as here set down, is nothing more nor less than the "cementing" (case-hardening) process by means of which low carbon steel, alloyed or not, is rendered hard on the exterior while the core is rendered soft but tough. This process is peculiar to low carbon steel, and cannot hold if the carbon is in excess. As a matter of fact, the carbon should not exceed .002 per cent. as a maximum, while it would be better below .0016 per cent. in strictly carbon steel, and even lower in alloy steel. Class (*X*) is not a well-defined class of the product of heat treatment. It is, in fact, what results from imperfectly conducting a defined heat-treating process. As a rule, this is what is not wanted in quest of a well-defined condition. When treated steel does not answer to any of the defined conditions, the author then prefers to classify the product as a "conglomerate."

It is possible, then, to consider some ten different conditions of steel, as a result of manipulation for the most part, it being the case that one of these conditions is the result of insufficient care in fabrication, i.e., the burnt structure (*VIII*). It is to definitely establish some one of these conditions that heat treatment is given to steel. If steel is in the normal state upon its receipt from the mill, some one of the other conditions can be fixed, assuming the steel is of a grade suitable for the purpose. It is not claimed that any grade of steel can be reduced to any one of the states before named, and it requires quite as much skill in the selection of the steel as it does in its manipulation. If steel is "nature hard," for instance, to render it soft will be an obvious impossibility. If, on the other hand, the steel is naturally soft, it may resist hardening by every known process unless the product is first "cemented" in order to increase the carbon content sufficiently to bring about the desired result.

Even then, it must be remembered that steel cannot be carbonized to a great depth, hence, the "core" will remain soft, although it may be toughened in the process. Likewise, it will not be possible to fix the sorbitic stage, unless the steel is so constituted as to render the process possible. The composition of the steel, the quenching temperature, and the sizes of the parts are all factors to be taken into account, not to mention the previous history and the skill of the artificer in influencing the result for good or evil, as the case may be.

Each alteration of the carbon condition will have its resultant change in the strength and performance of the steel. It fol-

lows, therefore, that any carelessness in ascertaining the exact composition of the steel, or any lack of deftness in the manipulation thereof, must react on the results to the detriment of the product. When alloying elements are present, the chances of failure are much enhanced, and it is only by repeated trials that the best results may be realized, provided the repetitions are under control and well-defined. What chance is there then of attaining exact results, if the process is conducted in a place not provided with any of the requisites or if the artificer is without exact knowledge of the attending phenomena?

With every facility, with the best possible steel for the purpose and with an artificer of pronounced skill, it is still possible to evolve but indifferent results in some cases. It is, on the whole, a considerable task to heat-treat some of the alloy steel products, and be reasonably sure of attaining the ends sought for. It is even a question if the more simple problems in heat treatment can be solved day after day, and not have a percentage of misses. The micro-structure is not the only thing to take into account, there is the question of the static and the dynamic ability; the utility as a bearing surface and the physical properties in view of the service to be rendered. A crystalline structure would, of course, be undesirable, and it might be said this sort of a structure would show in the microphotograph. At all events it is necessary to avoid a condition of crystallinity, and it is desirable to afford a silky fracture, as well as great density.

The test proof should be "cupped" if the steel is of great strength, and to attain this condition the heat treatment must be consistent with the requirements. Some grades of steel will not "cup" at all, and they are to be avoided, if the service to be rendered is that requiring a grade of steel that will be D.S.C.* at the fracture as the result of a pull test. Some grades of steel will show these phenomena under all conditions to which the steel can be reduced. The question of dynamic (kinetic) ability is one that should receive much attention in automobile work, and it is one of the purposes in heat treatment to establish this condition to the maximum possible extent. Steel can be rendered hard and at the same time it can have imparted to it increased kinetic qualities. On the other hand, the same steel can be rendered hard and have its kinetic ability almost completely destroyed.

Hardness Is Not the Only Quality Desired.

Tool steel, holding upwards of 25 per cent. Tungsten (other components to suit) will be rendered extremely hard if it is raised to about 1,400 degrees C. and cooled in an "air blast." But this does not mean the same steel will have dynamic value. Steel so manipulated will be good for its own purpose, *i.e.* as tool steel for cutting purposes. Certain grades of chrome nickel steel will be rendered hard if they are slowly raised to a temperature one-half that stated for tool steel, and allowed to cool in still air. These grades of steel will possess great kinetic abilities, serving perfectly for dynamic duties, but the steel so treated will not serve as a tool steel at all. Here is a case of a difference in temperature with slow cooling in air instead of forced cooling in the same media, and a difference in kinetic ability. Both products will be almost equally hard, but only one of them will hold a cutting edge.

A close observer would say then, that if steel will hold a cutting edge it may not be so good as a product for dynamic work. It would serve as a means of finding out if a product is dynamic, to a certain extent, at any rate. Indeed there are many ways of ascertaining the utility of a product besides the conventional tests, and such rule of thumb methods are employed as the preliminaries to a more complete test, if, after the quick, ready at hand trials, the steel is found of enough value to make further tests worth while.

Of course the micro-structure is a close index of all such matters, but it is unfortunate that there are but few practitioners who resort to the microscope, in every day work, if at all. To show that a difference in heat treatment will make a micro-structural difference in the steel, it is only necessary to consult the micro-photographs given in this work. In general, it will be possible to point out approximately the results of different modes of heat treatment which would hold even though the micro-structure be not examined. Take for illustration .009 per cent. carbon steel, this product would have, as before stated, 100 per cent. pearlite in the normal state. This same product would hold 100 per cent. martensite, as a result of quenching above Ar_1. Certainly the difference as between 100 per cent. pearlite and the same percentage of martensite is almost as the two extremes. It might be well to point out, however, that the steel so constituted would not be soft, even with 100 per cent. pearlite, and would be "glass hard" with 100 per cent. martensite.

Let us take another case with lower carbon; say .002 per cent. In this case, the normal steel would hold 22.2 per cent. pearlite, and the same steel, if quenched from a temperature above Ar_3, would develop a martensite formation of 100 per cent. On the other hand, if the same steel were to be quenched from a temperature between Ar_1 and Ar_3 the martensite of the quenched product would be equal to the pearlite of the normal steel. There is one other point to be explained before this matter can well be dropped. It was shown that the martensite would be 100 per cent. under certain conditions for both .002 per cent. carbon steel, and for the steel holding .009 per cent. carbon. Will the two separate grades of steel (very different in carbon) have the same strength in the martensite state? If the "tensility" alone be considered as sufficient to reflect the point to be made, the matter can be stated as follows:

Water quenching at 750 degrees C. has no appreciable effect on the tensile strength of steel between the limits of .002 and .009 per cent. carbon. The result is the several products will take on the hardness due to their carbon contents. It is not, therefore, probable that the 100 per cent. martensite in the widely differing products would be followed by a hardness the same for all. It seems almost unnecessary to raise this question at all, unless to more clearly point out the difference as between the hardness of martensite *per se* and steel hardness in general.

It is not to be inferred from this that the tensile strength of all the products with their respective carbon contents will remain stationary if quenched at 750 degrees C., but the alterations noted are not great, and it has been shown that to increase tensility, the water quenching must take place at a higher temperature, say 900 degrees C., at which temperature the products above .005 per cent carbon would be valueless unless a subsequent annealing process be conducted.

Equipment Should Be Sufficient for Requirements.

If it is true that the products to be heat treated must be manipulated with exactness, it is then true that the equipment must afford the means for doing so. Certainly a forge, a bucket of water and a pair of tongs will not suffice for the purpose. On the other hand, exact knowledge and a crude equipment is to be preferred to all the laboratory refinements in Christendom in the hands of a manipulator of no skill.

The prime considerations might be catalogued as follows:

(a) Steel of the desired qualities for the respective tasks to be accomplished. (b) Equipment of the hardening process consistent with the requirements. (c) Knowledge of the steel and the process of heat treatment. (d) Skill in the process.

This may be just as good a time as any to set down the general requirements of the steel to be treated, in view of results to be attained, for if knowledge of the steel and the equipment be at hand, the accomplishment of the rest of the task will be but a matter of execution. On the other hand, it is plain that the hardening room question is truly a separate matter from the abstract steel question; hence it will not be proper to discuss steel at any length at this time. The discussion here then will be limited to a few hints such as will aid the manipulator in the selection of the treatment to use under the several likely contingencies that are most apt to arise in the preparation of materials for certain specific purposes on the automobile.

*D = dense; S = silky and C = cupped, at the fracture of a test specimen or proof, International standard dimensions preferred.)

SHOP KINKS OF INTEREST TO THE AUTOIST

IN a former issue were given sketches showing how to anchor a Cape cart hood iron in case the original fastenings proved insecure. The method shown could be carried out without a blacksmith's aid and with only ordinary tools. If, however, the job can be sent to a blacksmith or to a carriage shop, a much more substantial repair can be made, as shown in the accompanying illustrations, picturing two or three modifications.

In Fig. 1, *A* is the iron, and *B* shows the original form of the lower end. The fault of this design is that there is no sufficient hold against the purchase of the overhanging upper end, in case the overhang amounts to several inches, as it sometimes does. In addition, the screw *C*, which does not go clear through the side of the seat, is too small to serve as a fulcrum. To correct this defect, the first thing to be done is to put a carriage bolt, *D*, right through the side of the seat, having its head outside, as Fig. 2 shows. To oppose the purchase of the upper end, the lower end must be cut off and a piece welded on it and shaped to act as a lever. It would be possible to

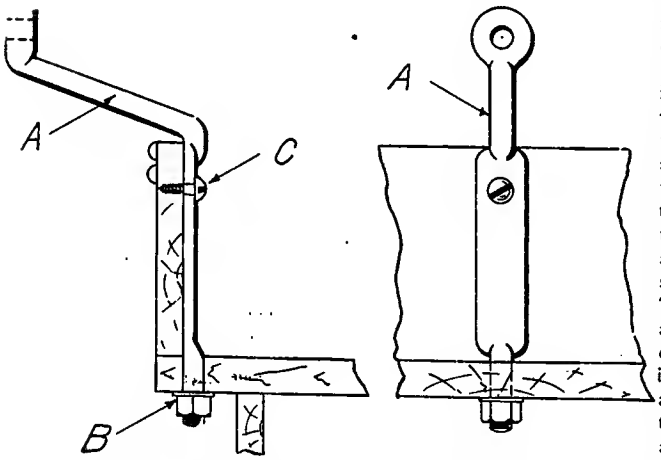


Fig. 1—Former method of anchoring cape cart top irons on body.

have this piece extend horizontally inward over the wood seat. This, however, might possibly interfere with taking out the gasoline tank, and in that case the extension *E* can be shaped as a flat inverted *T*. The ends of this *T* are drilled for bolts to pass down through the overhanging part of the wood seat. The *T* so formed does not need to be more than 1-8 or 3-16-inch thick, and if the edges are beveled off it will not chafe the bottom of the cushion. In a particular case the charge made by a wagon shop for this repair was $3.50 for two front irons.

Grounding Make-and-Break Contacts.

In a make-and-break igniter the grounded electrode is the rocking stem and finger. This stem is lubricated by what oil may chance to pass it from the combustion chamber. Usually this oil is sufficient for lubrication, and it may be so abundant as to interfere with the flow of current. It is not uncommon to see sparks jumping from this electrode to adjacent parts when the motor is running fast. In case misfiring is noted, and the insulation of the lava bushings is known to be good, a light coil spring may be connected between the rocking stem and any adjacent grounded part, such as one of the studs holding the igniter plate. This spring should not be stiff enough to interfere with the make-and-break movement. Soft copper wire is the best material for it, and one end of the wire may be soldered to a copper "battery terminal" held by the stud nut, this making a permanent and reliable method of fastening electrical connections.

Ordinary grease when used to stop spring squeaks has the objection that it quickly works out, leaving the squeak as bad as ever, and making it necessary to repeat the operation quite frequently. If graphite be mixed with the grease until the mixture is quite stiff it will last a good deal longer than grease alone. Best of all, however, is linseed oil and graphite, since this does not tend to cut the band like mineral or animal grease. The graphite should be added to the consistency of a stiff paste, and the oil then serves simply as a binder.

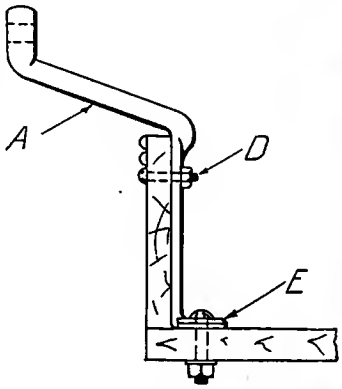

Fig. 2—Improved method of fastening.

A Clutch Renewal.

The leather of the ordinary cone clutch by degrees acquires a sort of coarse surface glaze, which may or may not represent actual charring of the leather, but is certainly due to the slipping it experiences. A leather with its surface so glazed has a very harsh action, since the surface is so hard that it grips all at once. The glazed surface will not absorb oil to any appreciable extent, a fact which is easily seen on attempting to dent the surface with a thumb nail after giving the oil time to soak in. In this condition the best thing to do is to put on a new leather. Unless the angle of the cone is too abrupt, a piece of ordinary belting will serve the purpose, provided it is of uniform thickness throughout. The belting may be soaked in neatsfoot oil over night before applying, and this will render it pliable enough to take the shape of the cone. If the old leather is retained in service it becomes almost essential to squirt a little oil on it every day or two, as otherwise it may take hold with such a jerk as to endanger the transmission shafts. If the cone releases by drawing backward, there are probably openings in the web of the cone through which the spout of a squirt can may enter. Oil squirted into the flywheel interior will then quickly find its way to the clutch surface. Sooner or later, however, the leather will become glazed so smooth that it will not hold at all, and it is then liable to slip and burn up without warning. There are few things more exasperating than a clutch which cannot be made to hold properly, particularly when the car happens to be covering a bad stretch on which every available bit of power that can be transmitted to the rear wheels is necessary. The use of emergency remedies under such circumstances most often leads to the necessity for clutch repairs, as road dirt and grit are not the best things possible for the leather facing, and frequently no other friction producing compound is to be had at the time.

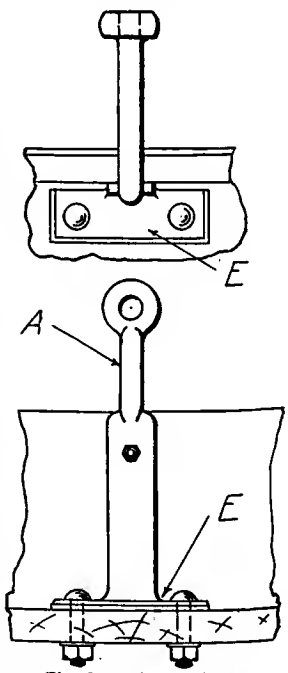

Fig. 3—"T" style irons.

ABOUT SOME CHARACTERISTICS OF MAGNALIUM

By M. R. MACHOL.

MAGNALIUM is an aluminum alloy which promises to fulfill the expectations based in the past on aluminum but never wholly realized. Like pure aluminum, it can be cast in a liquid condition. The castings can be machined about the same as brass. The machined surfaces are of a mirrorlike smoothness and silvery color, and perfect screw threads can easily be cut in the metal. Bored holes are always very sharp and clean, while filing results in fine, regular, cleancut surfaces without tearing up the metal or clogging up the file, and it will allow even the use of the finest files in its working.

Magnalium can be cast by any foundryman, the only precaution necessary being the use of clean graphite crucibles, and care must be taken not to increase the temperature too far above the melting point, as this weakens the metal. If cast in an iron chill, the tensile strength is greatly increased and is at a maximum if the chill is water-cold. Cast in dry sand, the usual quality of magnalium has a tensile strength of 18,000 pounds per square inch, and shows reduction of area of 3.75 per cent. Cast in iron chills, 22,000 to 25,000 pounds per square inch may be realized, the reduction of area being 5 to 8 per cent. The tensile strength of a quality containing a somewhat smaller percentage of aluminum equals about 34,000 pounds per square inch, but can be increased to about 42,500 pounds per square inch by proper treatment. By drawing, rolling, pressing, etc., the tensile strength obtained by quick cooling is still further increased. Wire drawn from one quality of alloy has a tensile strength of 41,000 pounds and 10 per cent. reduction of area, while it will stand 53,000 pounds if the raw material has been forged before drawing.

High Tensile Strength May Be Realized.

Soft rolled sheets of alloy "Z" have a tensile strength of 42,000 pounds and 15 per cent. reduction of area; hard rolled sheets about 52,000 pounds and 3 per cent. reduction of area. Magnalium containing less than a certain percentage of aluminum cannot be rolled but can readily be drawn. The tensile strength of a drawn bar was 60,000 pounds, and that of a tube 74,000 pounds per square inch. Another advantage of magnalium is that it is extremely close-grained, so that the polishing can be done without previous treatment by any special instruments. Furthermore, in lathe work, the tool speed can be twice as high, thus making a great labor saving. Pure aluminum, being soft, can be cut with a knife like zinc or lead, while magnalium is hard. Some magnalium alloys, however, are very ductile and can be forged, rolled, drawn, etc., sharing all the advantages of aluminum in this direction.

Annealed magnalium "Z" is so ductile that it can be rolled or beaten like silver. The elasticity of cast or annealed magnalium is small, but in the forged, hard-rolled or drawn material it is much greater. It attains and maintains a high polish and shows excellent resistance to atmospheric conditions. Its color is silvery white and it has the further advantage that its specific gravity is less than that of aluminum. While the specific gravity of pure aluminum is 2.64, magnalium shows 2.4 to 2.57, according to the percentage of alloy. The metals named below are the following number of times as heavy as magnalium:

Zinc	2.87	Brass	3.61
Tin	2.92	Silver	4.20
Cast Iron	2.88	Lead	4.56
Nickel	3.30	Gold	7.70
Copper	3.58		

The melting point is 640 to 676 degrees C., or 1,185 to 1,250 degrees F.

Magnalium does not have any odor and resists oxidation better than any other light metal, being almost unaffected by dry or damp air, water, gaseous ammonia, carbonic acid, sulphurate of hydrogen and most organic acids. It is only very slowly affected by saltpeter or sulphuric acid, and more rapidly by alkalies or strong alkaline solutions. Salt water attacks magnalium slightly, but where exposed to sea water the metal should be lacquered, which will protect it so that it will give excellent satisfaction. It shows almost no magnetic influences but its electric and thermal conductivity is about 58 per cent. of that of pure copper. The electric conductivity of the most important metals, taking that of copper as 100, is as follows:

Silver	100.00	Swedish Iron Wire	16.00
Copper	100.00	Tin	15.45
Gold	73.00	Platinum	10.60
Aluminum	63.20	Lead	8.88
Magnalium	66.10	Nickel	7.79
Zinc	29.90	Antimony	3.88

The specific heat of magnalium is 0.2185.

Treatment in Melting and Casting.

Magnalium is best melted in ordinary graphite crucibles, care being taken that the crucibles are perfectly clean. The metal must not be heated further beyond its melting point than necessary (about 1,200 degrees F.). The crucibles should be evenly surrounded with coke and should rest on a fireproof support, this being necessary to keep the crucible from direct contact with the grate and to prevent cooling the metal by an air draft after the coke burns up. The lid remains on the crucible to prevent contact between the air and furnace gases and the metal. The temperature should be as even as possible and the crucible should reach a red, but never a white, heat. When the metal is melted, the crucible should be removed from the furnace and placed on a warm iron sheet or other fireproof support to prevent the metal chilling from the bottom before pouring. The molten metal should be well stirred and the slag skimmed off, and then cast into an iron mould in such a way that the slag and oxidized skin can be kept back by a skimmer. No flux is necessary. In spite of its low melting point it should take 43 to 45 minutes to melt it.

In making sand moulds the sand is loosely pressed and should have as many airholes as possible. The casting channel should be cylindrical, the entrance should be wide and the casting funnels and the risers must be wide at the base and narrow at the top. The casting head should also be rather large. Where moulds are prepared in this way the air and gases can easily escape. The oxidized skin and slag will rise and the finished casting is absolutely free of pores or blowholes. For casting in an iron mould the metal must be hotter and the moulds should be well heated. When melting scraps, chips, turnings, etc., the larger pieces should be melted first, then the crucible should be removed and the borings, turnings, etc., be added, as otherwise the loss due to burning is too large. When melting large pieces this loss is not more than from one-half to one per cent. The loss in melting borings and file dust is as much as 10 to 15 per cent. In damp sand, the metal should be cast quickly and at as low a temperature as possible. In dry sand or chills, the metal should be bright red and should be cast slowly. Ingots must be cast in closed moulds with planed inner surfaces. The moulds should be well cleaned before using, brushed with graphite and well heated. Castings in sand should be cooled slowly, but chilled castings, especially ingots, should be cooled quickly, preferably in cold, flowing water. This makes the metal tough and ductile.

How the Metal Is Forged and Rolled.

Magnalium, especially alloys "X" and "Y," can be forged with good results most easily by heating the metal and then working about the same as Swedish steel. The metal must not glow red but must be hot enough to char a piece of wood. Of course, the casting has to be clean before forging to avoid cracks. The great ductility of magnalium, especially alloy "Z," makes it possible to produce plates of any thickness. The ingot is first heated to between 570 and 600 degrees F., and rolled so that the reduction at the first pass is about 20 per cent. Then the plate is

again heated. After the first two passes the plate is turned 90 degrees and passed through the finishing rolls until it reaches the required thickness for the particular purpose in view.

As magnalium rapidly loses its ductility in rolling it has to be annealed repeatedly. The rolls must be thoroughly cleaned and sprinkled with paraffin for every pass. If possible, it is advisable to work the ingot with a hammer before rolling. All roughness of the surface of the ingot should be scraped, as is done with copper or brass. A large amount of power is necessary for rolling, about as much as for heated steel. The operation is facilitated if the rolls are heated to a temperature of from 210 to 300 degrees F. Ingots thicker than .15-inch must be annealed after each pass. Below this thickness, plates can be finished by cold rolling. All other manipulations in rolling are about the same as with other metals.

Method and Results of Annealing.

Magnalium should be annealed in a muffled furnace in order to keep the flame and gases away from the metal, and the annealing furnace must be kept at an even heat. The metal must appear dark red and char a pine wood stick so that carbon particles separate from it. To anneal plates does not require as high a temperature. If plates are chilled in cold water, they will be very tough and ductile. The thinner the plates the lower should be the temperature of the annealing furnace. Plates of less than .01-inch thickness can be heated in boiling oil or water, and allowed to slowly cool. If magnalium is gradually heated to a temperature of less than 750 degrees F., and slowly cooled, the metal can be worked into springs.

It is a very ductile metal and in this respect is only surpassed by gold, silver, platinum and copper. The diameter of the cast ingot should be reduced very slowly at first, best results being obtained if the ingot is forged before drawing. Perfectly smooth wire as fine as silk threads has been made with astonishing tensile strength. Tubes made from plates or from cast hollow pieces are treated in exactly the same way as rods, namely, annealed repeatedly, chilled and drawn cold over a mandrel.

Where machinery is concerned, magnalium is remarkable, inasmuch as it can be tooled at high speed, about like steel. Screwthreads of considerable length can be easily and cleanly cut. The tools have to be very sharp, and the surfaces (both metal and tools) must be kept lubricated with either kerosene, turpentine, paraffin, benzine, vaseline, soapwater or even clear cold water. Excellent surfaces will result and perfect screwthreads or holes will be obtained. To cut magnalium, a fine-toothed saw, lubricated with kerosene, is recommended. Magnalium can be punched, drop-forged and pressed without any difficulty about the same as silver, brass or steel plate, if well annealed.

This new aluminum alloy is a German product and it has met with considerable success abroad in such applications as bicycle, automobile and aeronautical work. It is manufactured by a large German concern, for which the writer is the American representative at 32 Park place, New York City.

PERMITS NEEDED IN MT. RAINIER PARK.

SEATTLE, WASH., Aug. 12.—No automobiles will be admitted to Mt. Rainier National Park henceforth unless they are provided with a permit from its superintendent, G. F. Allen, of Orting, Wash. Permits may be obtained for one year only.

A MAXWELL AMONG THE GIANT TREES.

Every school geography mentions the giant redwood trees of California, and usually has a picture showing a stage coach being driven through an archway cut in one, or a dozen men just able to join hands around the trunk. The up-to-date owner of a Maxwell runabout decided that these pictures were apt to give the youthful mind a wrong impression, and encourage them to believe that California was still a country of stages, cowboys and hold-up men; so, being a man of action, he immediately undertook to furnish a proper substitute. The result is the striking photograph printed below. Certainly no more startling contrast could be asked for than that between the little Maxwell and the giant trees to right and left of it.

Much has been written about these wonderful redwoods that are the peculiar product of Humboldt county, California, but scant justice can be done them from a description of their beauties, and they must be seen to be fully appreciated. A peculiarly romantic interest attaches to these forest monarchs when it is remembered that they are the only living things in the world that were alive when Cæsar marched his all-conquering legions through Gaul, and were saplings at the beginning of the Christian era. Some of them are declared by scientists to be at least 2,200 years old, and some are 300 feet tall.

Among the Giant Redwoods of Humboldt County, California, in a Maxwell Runabout.

LETTERS INTERESTING AND INSTRUCTIVE

WHAT MAGIC GASOLINE CAN THIS BE?

Editor THE AUTOMOBILE:

[1,508.]—I have for months pest read your very interesting "Letters," which are more or less instructive. I have read on all complicated matters but one, which, by accident, I happened to tbink I have not seen any inquiry nor reply. This is the quality of gasoline used in motor cars and its effect on the power produced. I own a four-cylinder air-cooled Franklin car. It is in perfect condition, runs fine, and I have only one objection to it, and thet is, that it has not power enough (12-horsepower) to carry me over eteep and long hills on high gear. I took a trip of 128 miles last week and through a very rough and broken country. I ren out of gasoline. I uee Standard Oil Company's gasoline when here. Not being able to buy any gasoline at any store there, I finally secured some at a drug etore. I started out end to my amazement I had from 35 to 40 per cent. more power. I went up almost any hill on high gear and when on the level, on querter open throttle, and my car, literally speaking, ran away with itself. What kind of gasoline could thie have been? I wrote this druggist but up to now have had no reply. Upon my return here I 'phoned the Standard Oil Company my experience. They say they have an 88 proof gasoline, but they cautioned me not to use it, as it is vory dangerous and extremely explosive. Could you enlighten me and possibly others by telling what kind of gasoline is best to use and to give the most power.

Chattenooga, Tenn. FRANKLIN.

We are equally at a loss as yourself to tell you exactly what kind of magic fuel the dealer in pills and ointments must have given you to account for the wonderful increase in power, but if he sold it at the usual commercial rates, we should certainly advise buying it from him by the barrel. Most of us have to be content with what the "octopus" hands out, for there is no other obtainable in the ordinary course of affairs. On the other hand, as your car has more than sufficient power for its weight to take it up anything but the steepest hills on the direct drive, and over level roads at a very good pace, we think you might find it profitable to look to the condition of the motor and its accessories as a means of accounting for its ordinarily sluggish action. The carbureter may be poorly adjusted for the fuel you use ordinarily, the valves may need grinding in or any one of half a dozen other things may require attention. The ordinary commercial gasoline will be found to give the maximum power obtainable in the modern automobile motor for everyday use, provided conditions are right, *i. e.*, the motor is in good condition throughout and the carbureter is adjusted to suit the fuel. The specific gravity of the gasoline now supplied is slightly lower than what it was several years ago owing to the largely increased demand for gasoline and the fact that the percentage of the lighter distillates in crude petroleum no longer makes it profitable to distill them except for special purposes and in comparatively small quantities. We are at a loss to explain what the dealer meant by "88 proof," unless he intended a specific gravity of .88 and there is mighty little of such light gasoline now to be had. It could only be more explosive by being lighter and hence, more volatile, but any grade of gasoline fit for use in a car will vaporize quickly enough to render an explosion imminent.

NO TRACE CAN BE FOUND OF THEM.

Editor THE AUTOMOBILE:

[1,509.]—Seeing letter No. 1,498, from George Briggs, I might say that I elso saw the advertisement he mentions and would like to obtain a copy of the book myeelf. I sent a post office order to the Lansing-Mahon Prcss, Chicago, but it did not reach them, and then I sent them a registered letter, but this wae also returned. I would like to know their preeent address.

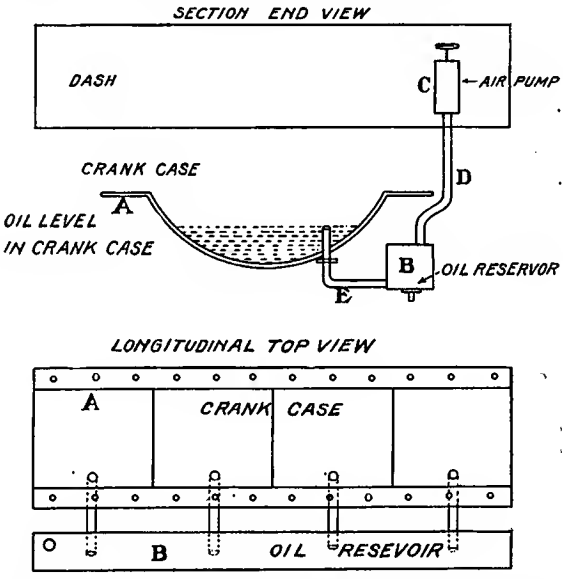
East Milton, Mass. THOMAS A. HUNT.

A great many other people, who were not as fortunate as you in having their money returned to them, would also like to know the present address of the concern in question, but it has disappeared, leaving no trace behind. (The book was entitled "How to Know Automobiles," and it was said to contain "1,000 distinguishing features; you can know any car at a glance."—Ed.)

ORIGINAL SYSTEM OF SPLASH LUBRICATION.

Editor THE AUTOMOBILE:

[1,510.]—I note with interest letter No. 1,495 and your reply concerning the best way for using splash lubrication. I would like to give your readers the benefit of a new eystem I have worked out. I have never seen a force pump that was absolutely reliable and I believe the proper way to lubricate the cylinders, camshaft, etc., is by splash, if the oil is alwaye kept at the proper height in the crankcase. My experience has taught me that the cranks should dip about 1-4 inch in the oil. I encloee a sketch showing my plan. AA crankcase, BB oil reservoir, C hand air pump on dash, D pipe leading from pump to top of reservoir, E pipe leading from bottom of reservoir up through each compartment of crankcase to the height oil should stand in the crankcase. Tbe top of oil reservoir should be located, say 1-4 inch, lower tban the desired height of oil in crankcase. This pipe through crankcase can be screwed in so it can be adjusted to proper heigbt; all pipes should be at least 1-2-inch, in order to allow a quick movement of the oil. A crankcase filled to the proper height with oil will lubricate an engine from 40 to 50 miles witbout replenishing. The working of the system is as followe: Give the air pump about a dozen strokes, which will force into the crankcase about one pint



Sectional Diagrams Showing Mr. Lanpher's Lubrication Plan.

of oil, and in every case pump more than is required. The surplus will, of course, quickly flow back to the reservoir, leaving the required amount in the crankcase. The pumping should be done about every 40 miles, or two or three times a day. By so doing you have positively and absolutely the necessary amount of oil in the caee at all times, no watching drops or guesswork about it.

What might be as well, or possibly better, is to dispense with the pump, and connect from top of reservoir to the exhaust pipe with open and shut valves located at a convenient place which could be opened for about one minute's time three or four times a day, or say four times for a 100-mile run, but in such case the valve or cock should be a three-way cock, so that when closed it would open an air passage to relieve the pressure in the reservoir so that the surplus oil in the crankcase could immediately return to the reservoir. The system is cheap, practical, and absolutely reliable. C. W. LANPHER.

Norwich, N. Y.

We agree with you that there is no more effective method of oiling a motor than by splash lubrication, and every car on the market to-day, regardless of the elaborate point to which its lubricating system has been carried, depends upon the splash in the crankcase to some degree. In fact, this is usually the foundation of the system, the force-feeds being more for the purpose of insuring a constant supply of oil at vital points. But the oil from these feeds eventually joins the supply in the crankcase and

is utilized for splash lubrication. We can also agree with you that the ingenious system you have devised is cheap, simple and practical, but hesitate at concurring in your statement that it is absolutely reliable. How can it be, when it depends entirely on the driver? To paraphrase George Ade, "If a patent auxiliary could be provided that would jump out of the oil reservoir every 40 miles, hit the driver a sharp kick in the pants and shout in his car, 'give the air pump a few strokes'," then we would be willing to say that it was all you claim for it, but as long as human nature remains what it is, any system that requires attention at such frequently recurring intervals as 40 or 50 miles hardly merits "absolutely reliable" as a recommendation. The personal equation is too strong a factor, and the driver is apt to forget it much oftener than where the oil supply only needs renewing every three or four hundred miles.

We have always been strong advocates of what may most aptly be termed the continuous circulating system of lubrication, in which oil is raised from a well situated beneath the crankcase to a reservoir or tank located alongside the engine, and from the latter dropped by gravity through liberal sized tubing to the crankcase, any excess overflowing into the well and again being raised or circulated. A sight glass located on the dash shows that the oil is running and with the exception of the pump, there are no small parts and no adjustments to make. On some cars, such a system is supplemented by a force-feed oiler, while on others it is depended upon as the sole means of lubrication. Experience has shown that the most effective and reliable systems of lubrication are those that depend upon the running of the motor for their action and not on the memory of the driver. We can readily understand, that having evolved your own method, you do not find it difficult to follow it out, but the many motors that have been ruined in the past five or six years through forgetting the oil tell a very different tale.

FUNCTION OF THE TORSION ROD.

Editor THE AUTOMOBILE:

[1,511.]—Please explain through "Letters Interesting and Instructive" the function of the torsion rod on the shaft drive automobile. Some machines don't use them and I cannot work out their office.

Quitman, Ga. W. MATHEWS.

When the manner in which the power is transmitted from the change-speed gear to the rear axle on the shaft-driven car is considered, it will be apparent that the turning of the shaft imposes a twisting strain on the whole rear end of the car and that if it were not for the frame and the weight of the car on the ground, there would be a tendency to revolve the rear of the chassis around the shaft, rather than to turn the wheels. But it would be bad practice to permit this strain to fall on the frame and hence the office of the torsion rod, which is designed to prevent its reaching that member. On cars that are not provided with independent torsion rods, it will be found that the housing of the propeller shaft has been made correspondingly stronger and that its support has been designed to enable it to act in this double capacity. This represents a simplification of design that will be found on quite a number of cars, as it eliminates a part exposed to mud and dirt.

EXPLAINING A LOSS OF POWER "ON HIGH."

Editor THE AUTOMOBILE:

[1,512.]—Kindly answer this question in "Letters Interesting and Instructive." I have a friend who has a single cylinder Oldsmobile which works all right on the low gear, but whenever it is thrown on the high or direct drive the engine dies right down and will not give any power.

Belleville, Pa. B. HARRY SMUCKER.

There are such a number of things that may be the cause of this failure of the motor to carry the load on the high gear that it is difficult to sum them up in a word. The compression may be poor, the valves may need grinding, they may not be properly timed, the ignition timing may not be correct, or it may be that the simple adjustment of the carbureter alone may correct the entire trouble. Owing to the very heavy flywheel used on the motor in question it will run light, *i. e.*, without load, even though badly handicapped by faulty adjustments or other defects, once started, and will apparently be operating normally until the load is applied. Start the motor and then gradually shut off the gasoline at the carburcter until it will no longer run without missing; open the valve again very slightly and fasten at that point. Speed the engine by advancing the spark and opening the throttle and see if the auxiliary air valve of the carbureter works properly, tightening or loosening the spring slightly until the motor works properly at all speeds. Look to the adjustment of the ignition timer as this was an extremely crude device on the Olds runabout. Once the motor can be run at all speeds without missing or apparently losing power while not under load, try it on the road. If the adjustments have been properly carried out, it will doubtless be found that the car will run all right on both speeds, as it is usually an improper carbureter or timing adjustment, or again, failure of the trembler to respond properly, that causes this apparent total loss of power when the direct drive is used, as a serious fault like loss of compression through worn piston rings or valves, would not prevent the motor from responding altogether, but would not permit it to develop anything like its normal output.

COUNTING THE R.P.M. OF AN AUTO MOTOR.

Editor THE AUTOMOBILE:

[1,513.]—Would you be so kind and answer me in your "Letters Interesting and Instructive" the following: Which is the easiest way to find out how many revolutions a gasoline engine makes per minute.

Haledon, N. J. EMIL LOEBEL.

The simplest and most convenient method is to apply a revolution counter to the end of the shaft. As few shafts are ever manufactured without the necessity, at one time or another, of being centered in a machine tool, a small countersunk recess will be found on the end. The pointer of the revolution counter is made to correspond with this recess, so that to use the instrument it is only necessary to insert it in the latter, maintaining sufficient pressure against the shaft to insure against loss by slipping. One man should hold a stop-watch, while a second operates the revolution counter. Take half a dozen consecutive readings of one minute each and average them up, and it will be found that this will compensate for any small errors in the handling of the watch and the counter.

MORE ABOUT REBUILDING AN OLD CAR.

Editor THE AUTOMOBILE:

[1,514.]—Referring to letter No. 1,488, by Douglass Adams, I will say that I installed the Bellfuss Motor, and, in fact, did all of the work of remodeling the Pope-Hartford Car, which he says works so admirably. And if it will be any help to Joseph Sylvester, of Jamaica, N. Y., will say that I have ordered a 10-12-horsepower Bellfuss Water-cooled Motor, to be installed in an Olds runabout. This 10-horsepower two-cylinder motor is to replace a 4 1-2-horsepower single cylinder motor, and when the job is completed I will let you know the result.

Keene Valley, N. Y. E. R. WELLS.

As there are a great many old cars that could be improved by the equipment of a new power plant and a few touches here and there, the cost of which falls far short of the expense of buying a new car of equivalent capabilities, we are always interested in learning the results of these attempts.

WHO CAN FILL THIS REQUIREMENT?

Editor THE AUTOMOBILE:

[1,515.]—As a subscriber to your valuable publication, I should be pleased to have you inform me if you know of any architect or builder's plans of private garages that can be purchased. I am thinking of building a garage at my country place here, big enough to house two or more cars.

Chatham, Mass. H. M. CARRUTHERS.

We do not know of any one at the moment, who makes a specialty of supplying plans for small private garages, but are under the impression that this is done and probably some of our readers can come to the aid of the inquirer.

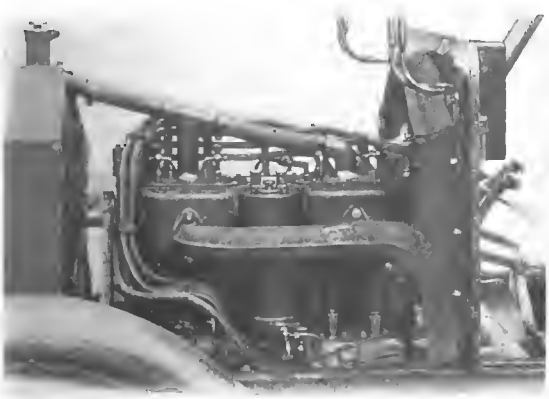
THE Packard Motor Car Company, of Detroit, is making the first deliveries of the new Packard "Eighteen" town car. This new Packard is exactly like the 1909 Packard "Thirty" in design and construction, but has smaller proportions to adapt it especially to the requirements of city and suburban driving of all kinds. It is furnished as a limousine, landaulet, runabout or five-passenger open car.

The four-cylinder, vertical, water-cooled motor is of 4 1-16-inch bore by 5 1-8-inch stroke, and is rated at 18 horsepower by the European system. The cylinders are cast in pairs, with water jackets and valve chambers integral. The castings for cylinders, exhaust manifolds, pistons and piston ring blanks are made in France from especially adapted gray iron. The pistons are ground and fitted with four ground rings. Cylinders, pistons, and rings are lapped together with a polishing agent to obtain an absolutely perfect fit between them.

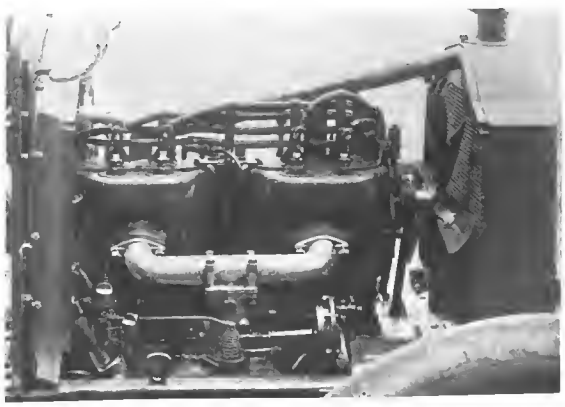
The crankshaft is like that of the Packard "Thirty," which is noted for extreme accuracy, due to special manufacturing and inspection methods. All bearing surfaces are ground. It runs on three large bearings, bushed with Parsons white brass. The connecting rods are drop forgings. The crank pin bearings are bushed with Parsons white brass and the piston pins with Packard special bronze. The inlet and exhaust valves are on opposite sides of the cylinder, all mechanically operated and interchangeable. The camshafts are enclosed within the motor crankcase, being fully protected from dirt and certain of luhrication. The new system of camshaft drive gears insures long life and silent running. All camshaft as well as magneto and water pump gears are contained in a separate but integrally cast oil-tight extension.

The crankcase is cast of special aluminum alloy in three horizontal sections. The uppermost section forms the engine base and is supported directly on side members of the main frame of the car. On each side, between the transverse supporting arms, is a horizontal, integrally-cast web, entirely enclosing the space between motor and frame, thus affording complete protection to motor, magneto and other parts. The crankshaft bearings are held between the uppermost and middle sections. Extreme rigidity of the main bearings is obtained by massive webs. The bottom section is an oil well, easily removable for inspection or adjustment of connecting rods, camshafts, etc., without disturbing the crankshaft bearings. The crankcase is divided into front and rear compartments by a central partition, which supports the middle crankshaft hearing and serves to stiffen the case.

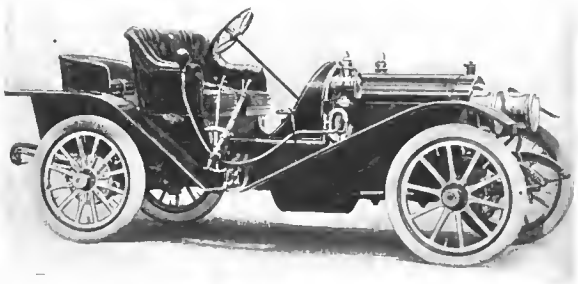
The carhureter is of special Packard design and construction, of the float-feed, aspirating nozzle type, with automatic auxiliary air inlet. The cylindrical and vertical mixing chamber has an aspirating nozzle in its lower portion and a butterfly throttle above, to control the quantity but not the



Packard Features on a Smaller Scale.



Essentially a Replica of Packard "30."



Lines of Packard "18" Runabout.

quality of the mixture. The auxiliary air inlet is a poppet valve under control of an adjustable coil spring and automatically governs the intake of air to keep the mixture at correct proportion for all engine speeds. Spring tension to suit different atmospheric conditions is regulated by a small lever on the dashboard. The carbureter is kept at uniform temperature by warm water circulating through a jacket surrounding the mixing chamber. For starting in cold weather there is provided a primary air intake shut-off, operated from the front of the car near the starting handle.

Water circulation is positive by means of a gear-driven centrifugal pump. A special feature of this pump is its hydraulic-pressure lubricated thrust bearing. The radiator is of the cellular type, combined with the tank. Forced draft to increase cooling efficiency is obtained by a belt-driven ball-bearing fan adjustably mounted on the forward cylinder.

Dual Ignition Is Part of Regular Equipment.

Ignition is by jump spark, the current being obtained from an imported Eisemann low-tension magneto, mounted on the left side of the motor bed and direct gear-driven by enclosed gears. A Fulmen imported storage battery, for starting the motor from the seat, is always in reserve. A transformer coil for the magneto current and a vibrator coil for the battery current is arranged as a unit in a box on the dashboard, with a single hand-lock switch between. The commutator for the battery primary current is on a vertical shaft at the rear of the motor and is driven from a camshaft by enclosed bevel gears. The distributer, high-tension wires and spark plugs are common to both magneto and battery systems. There are universal knife switches at the plugs..

Lubrication is by splash, from the crankcase to cylinders and all motor bearings. Oil is pumped separately to the front and rear compartments of the crankcase, in each of which is maintained an independent level of oil. The double plunger oil pump, with adjustable strokes, is accessibly located at the left of the motor and is driven by a worm on the exhaust valve camshaft. Oil is pumped from a vertical copper reservoir close to and between the pairs of cylinders, so that the oil will be warm and kept in fluid, easily flowing condition even in coldest weather. There are two drip sight feeds on the dashboard. The crankcase drain cocks have anti-clogging devices.

The New Packard as a Landaulet.

The motor speed is regulated by an effective and easily controlled hydraulic governor incorporated in the water circulating system and acting directly on the butterfly throttle. A pedal cuts the governor out of action for instantaneous acceleration and high-speed running. The throttle also is under control of a hand lever on the steering wheel. Another lever on the steering wheel advances and retards the spark.

The drive is through a Packard type internal-expanding clutch which insures gradual engagement. The expanding ring within the flywheel rim is actuated by an adjustable screw-and-nut device. The propeller-shaft, connecting the clutch with the transmission gear, has an effectively encased universal joint at each end. The speed-changing set, bevel gear final drive and differential gear are contained within a rigid aluminum housing forming a rear axle unit. The housing is internally ribbed and is provided with inspection holes. The differential gear unit is supported by its own bearings, so that the live rear axle may be withdrawn without disturbing the gears. Three forward speeds and reverse are obtained by sliding gears, third speed forward being direct drive. Gear shifting is easily and progressively accomplished, as the actuating slide rod is annularly grooved to correspond with spring-retained spacing dogs, which determine the correct positions of gear engagement. The single speed-change lever gives the reverse by a lateral movement. All gears in the transmission, final drive and differential and the rear axle, run on imported annular ball bearings.

There are four brakes, all acting on rear wheel brake drums. The external contracting brakes are operated by a pedal for regular use, and the internal expanding brakes are operated by an emergency hand lever. A drum disc entirely encloses and protects each internal brake.

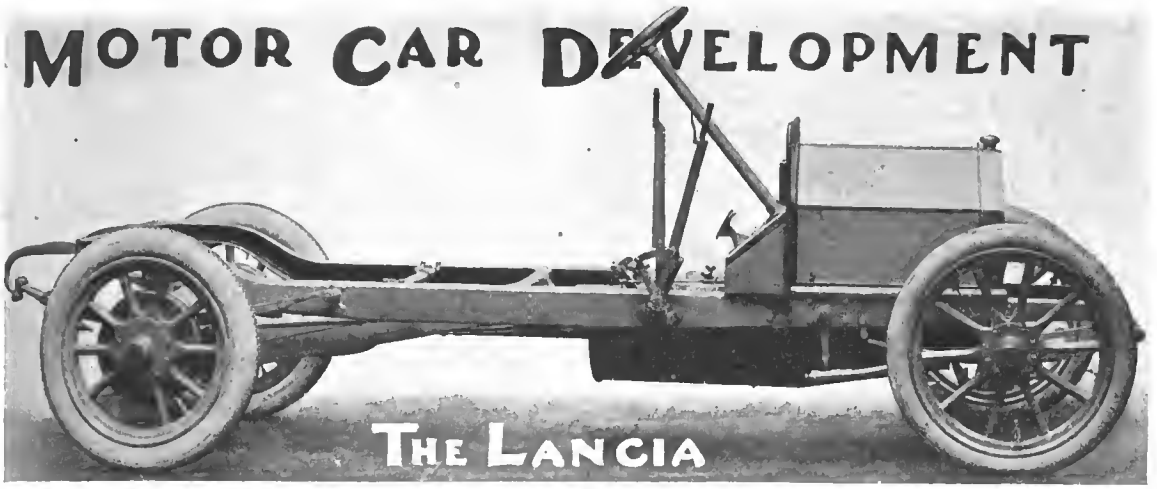
Steering is by a large hand wheel, on a large, rigid column, with worm-and-sector gear. The worm and sector are forged integrally with their respective shafts. The steering spindles and jaw type yokes are drop forgings. The steering connecting rod between the hand wheel gear and the steering knuckles is placed above the front axle to minimize jar on the hands. The steering knuckles have imported ball thrust bearings. All steering connections have grease cups.

Specification of the Chassis Foundation.

The running gear is of channel section, pressed steel: arched above the rear axle to provide ample spring action without raising the body. The top and bottom flanges of the side bars have integral gussets for the reception of the cross members. All rivet and bolt holes are drilled in full-length jigs. There are four wide, semi-elliptical springs, 40 inches long in front and 50 inches long in the rear. The front axle is steel tubing of large diameter and heavy gauge. The stationary sleeves of the rear axle are steel tubes pressed into and riveted within flanged collars bolted to the differential housing. The wheel base is 112 inches and the tread 56 1-2 inches. The tires, front and rear, are 34 by 4 inches.

The runabout wheelbase is 102 inches, instead of 112 inches. The motor and driver's seat are farther back on the frame than in the open car, to properly distribute weight. The steering post has greater rake, and the divided front seat is lower. The gasoline tank is on the rear of the frame, the gasoline feed being by a simple automatic pressure system. There is a rumble seat above the gasoline tank. The standard tire equipment is 34 by 3 1-2 front and 34 by 4 rear. Otherwise the runabout specifications are the same as the open car. The price of the Packard "Eighteen," with limousine body, in standard finish and equipment, is $4,300; with landaulet body, $4,400, and as an open car or runabout $3,200.

MOTOR CAR DEVELOPMENT

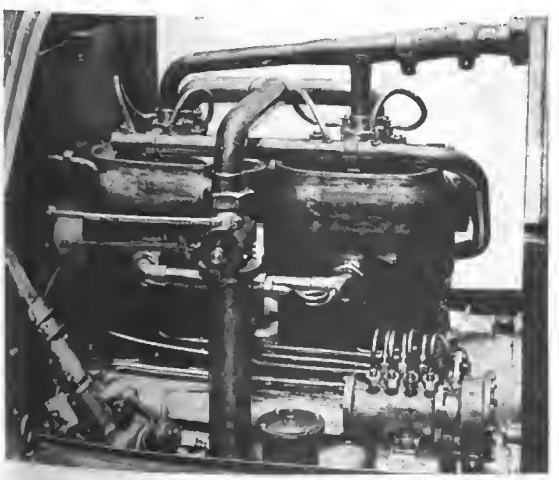


THE LANCIA

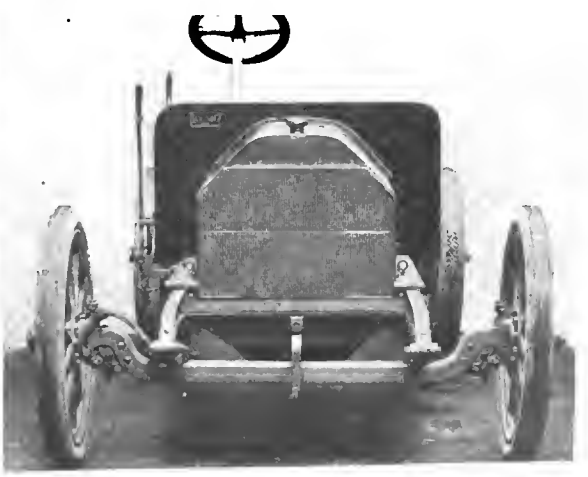
PILOTING a racing car has usually proved to be but the stepping stone to further and more substantial advances in the automobile industry, but it is not often that a racing driver branches out for himself as a designer and constructor of cars. This, however, is what Vincenzo Lancia, who is as well known on this side of the Atlantic as on the other, through his work in the Vanderbilt races, has been doing since he severed his connection with the Fiat house. The Lancia car has been on the market abroad since early in the year, and is now being handled in this country by the Hol-Tan Company, 244 West Forty-ninth street, New York, Harry Fosdick, sales-manager of the latter concern, giving special attention to its introduction here.

As is customary on the other side, its rating is very modest, but at 1,400 r.p.m., its compact power-plant develops 25 horsepower. The reproductions from photos shown herewith depict this small model. Its motor has the cylinders cast in pairs, the dimensions being 90 mm. by 100 mm., or 3.5-inch bore by 3.9-inch stroke, and in the majority of respects it closely follows approved Continental lines. However, it has several exclusive features, such as the twin-jet carbureter, each jet being located in a mixing chamber of its own, one being used for low speeds, while both come into action at a predetermined position of the rotary throttle located above them. The carbureter is water-jacketed and the auxiliary air valve is of the dash-pot type. A high-tension magneto is employed for ignition, which is fixed, and both the magneto and water pump are placed on the valve side of the engine. The carbureter is located on the other side and a special distributing oil pump operated by a transverse shaft and skew gearing is also placed there, as shown by the accompanying photograph of the motor. Throttle control is by means of a small reel incorporated in the rim end of one of the steering wheel spokes in the manner that has become familiar on the Panhard cars, except that the reel can easily be rotated with the finger.

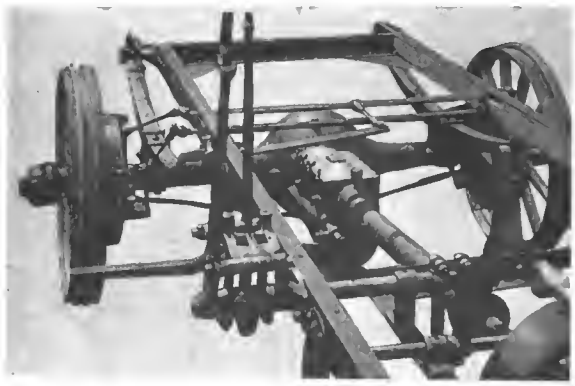
The front axle, which is of pressed steel of U-section, like the side members of the frame, and the suspension of the motor and gear-box are features of interest. The lower half of the crankcase and the gear-set housing are cast integral, provision being made for the reception of the flywheel and multiple disc clutch. The completed unit is bolted directly to the side members of the frame in six places, three on a side. Extending arms are cast at the front of the crankcase and the rear of the gear-set housing, making four points of support, while what may be termed the aluminum frame on which these two essentials rest, is also extended to touch the frame where the casting is spread to avoid the flywheel. Final drive is by shaft running in a sleeve to the live axle, which has a webbed differential case divided vertically and supported by a pressed steel torsion rod. The brakes are all of the metal-to-metal type. In addition to the foregoing model, a 30-horsepower six-cylinder car has also been on the market during the past half year or more.



Off Side of Motor, Showing Carbureter and Oiler.



Head-On View, Illustrating the Novel Front Axle.



Correja Rear Axle Assembly, Including Gear Box.

A NEWCOMER—THE CORREJA.

A good-looking newcomer to the automobile trade is the Correja, manufactured by Vandewater & Co., of Iselin, N. J. Although of good size and ample power, it belongs in the medium price class, selling complete for $1,900. The motor is of standard design, having its four 4 3-4 by 5-inch cylinders cast in pairs, with all valves on the right side actuated by a single camshaft. Timer and oil pump are on a vertical shaft at the rear of the motor. The spark coil and switch are mounted on the dash, which is otherwise unencumbered; dry batteries are regularly used for ignition, although provision is made for mounting a magneto as an extra. The cooling is taken care of by a square-tube honeycomb radiator with belt-driven fan and centrifugal pump. A leather-faced cone clutch and enclosed shaft transmit the power to the change-gear, which is carried on the rear axle. The three speeds forward and reverse are controlled selectively. The frame is of steel filled with wood, carried on long semi-elliptic springs. The wheelbase is 110 inches and the wheels are 34 inches in diameter, shod with 3 1-2-inch tires in front and 4-inch tires in rear. A five-passenger touring body is regularly fitted, but a runabout will also be made. The manufacturers have made no attempt to bring out any startling novelty, but rely rather on good workmanship and solid construction. In spite of the moderate selling price no expense has been spared to produce a thoroughly high-grade car; as an example may be mentioned the radiator, which is one of the costliest types made. Several of these cars are already in use in northern New Jersey and the owners report that they are giving excellent service. The company will establish agencies for the sale of the 1909 model and open up a wider territory than before, having previously confined its efforts to home territory in the marketing of its limited output.

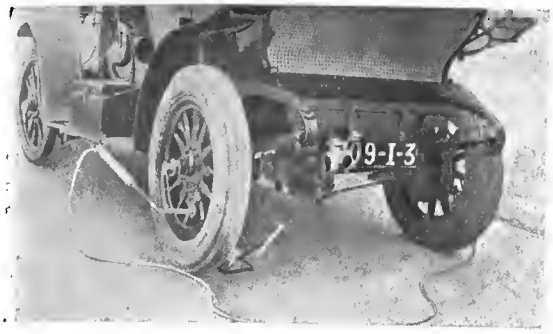
Quartering View of the 1909 Correja as a Touring Car.

NEW MODEL OF THE POPE-WAVERLEY.

Under the title of Model 70-C, four-passenger victoria coupé, the Pope Motor Car Company, Indianapolis, Ind., has recently brought out the attractive looking electric car shown by the accompanying photograph. It is a vehicle that possesses all the adaptability of the two-passenger type for the requirements of city work, but has been designed to have a wider range of usefulness as an all-round vehicle in that it makes a comfortable and stylish equippage for theater parties or other occasions where four passengers are to be accommodated. It is quite as roomy as the conventional horse-drawn brougham, beside being much more speedy and dispensing with the coachman. Removing the coupé top transforms it into an open victoria phaeton.

The power plant consists of a single motor of special Pope-Waverley design and capable of standing an excessive overload. It is supplied with current from a battery of 30 cells of 11 plates each, 10 of the cells being placed in the forward compartment and 20 in the rear, thus making an equitable distribution of the weight which gives easy and comfortable riding. The drive is by means of the noiseless "herringbone" type of gearing that has always characterized the Pope-Waverley cars, the pinions being protected by dust-proof cases and running in oil. Steering is by side lever and a combination volt-ammeter is provided. There are two foot brakes and one electric brake. The body measures 89 inches over all, while the wheelbase is 68 inches and the tread 54 inches. The running gear consists of wood artillery wheels, 30 inches in diameter and fitted with 4-inch detachable pneumatics of standard make. The top is finished in broadcloth to match the upholstery, but can be replaced by a full leather top when desired. With a removable coupé top, the car lists at $2,150. An excellent idea of the very attractive lines of this latest addition to the Pope Waverley family of electrics may be had from the accompanying illustration. The method employed of dividing the battery between the special compartments provided for it fore and aft, lends itself admirably to the production of a body that is not only well-balanced mechanically, but also artistically. The underbody has been freed from encumbrances in this manner, without raising the center of gravity.

Pope-Waverley Electric Victoria Coupe.



Banche Tire Inflator, as Attached to Car and Applied to Tire.

TIRE INFLATOR OPERATED BY MOTOR.

PARIS, Aug. 10.—Tire inflators operated by the motor have been put on the market in such quantities that the introduction of another one, though it is a model of simplicity, will probably not make any serious difference. The Banché system, which has just been introduced to France, makes use of the ordinary hand pump with the addition of five extra parts. A metal bearing is fitted under the running-board of the car, about a foot from the rear end, and is disposed to receive a steel spindle secured by a cotter pin, a couple of inches only projecting. To the base of the pump is attached a special socket which fits on the projecting pin, a cotter pin securing it. Instead of the ordinary pump handle there is a tube screwing into a bracket permanently attached to two of the spokes of the rear wheel. The result is an ordinary pump attached to the running-board, but free to turn in its bearings, and the piston secured to an arm projecting from one of the spokes of the rear wheel. On one side of the car being jacked up, the engine started and the low gear put in, the pump goes into operation. Naturally, only three tires can be inflated with the apparatus in position. To inflate the fourth one it is necessary to transfer the pump to the opposite side, a simple matter, however, seeing that the bearings are carried under each running-board and the apparatus is reversible. The only permanent visible attachments are brackets on rear wheel.

TRACY TESTS THE G-L ECONOMIZER.

In order to show exactly what could be accomplished with the aid of the G-L Economizer, the American agents, the G-L Patent Economizer Company, retained Joseph Tracy to make a test of it under the ordinary conditions of everyday running. The purpose was to discover exactly the distance a car could be driven with the economizer in operation, as compared with the mileage it could make without this aid. The fuel used in both cases was ordinary commercial gasoline purchased at retail, the tests being made in New York City during the month of June. The car was a 24-horsepower, four-cylinder Buick and was driven over the same route in making the tests with and without the economizer in operation. The atmospheric temperature ranged between 50 and 80 degrees Fahrenheit during the course of the tests.

The carbureter was of the ordinary float feed, spray nozzl type, fitted with an auxiliary air valve. On June 16 the car used for the test was driven 17.8 miles on a gallon of gasoline, with the economizer attached, but not in operation. Two days later the same car was driven 24.6 miles per gallon over the same route and with the same fuel and conditions, except that the economizer was working, the latter accordingly showing a gain of 6.8 miles per gallon. The average speed maintained throughout the tests was about ten miles an hour, and on both occasions the car was driven on the high gear except when starting. The clutch was not disengaged in either test when the car was running down hill, the desired retardation being obtained by closing the throttle and so utilizing the braking effect of the motor.

ANOTHER "BUGGYABOUT" TYPE MAY APPEAR.

SYRACUSE, N. Y., Aug. 17, 1908.—Within a year Watertown, 70 miles north of Syracuse, will be substantially interested in the automobile manufacturing industry. The H. H. Babcock Company, one of the largest carriage-making concerns in the world, has adopted plans for an 80 x 25-foot building near its present large plant, and will therein manufacture gasoline engines and gears for automobiles, to later embark in the business of making the entire machines.

It is stated by the company that the style of the vehicle is more on the plan of a carriage than the present form of machine, and the car will be built with a view to comfort and lightness and ordinary road and hill climbing rather than for speed purposes, and will be sold at a comparatively reasonable figure.

HUGE PRESS FOR STAMPING AUTO PARTS.

To the large and interesting line of heavy stamping and forming presses in operation at the works of the A. O. Smith Company, Milwaukee, manufacturers of automobile parts, has been added what is claimed to be the largest double-acting press on earth. This is an enormous double-acting toggle press, weighing more than 82 1-2 tons, measuring 23 feet in height and resting on a foundation of solid concrete extending many feet below the floor. It is liberally made of solid cast steel, and the bearings are bushed with phosphor bronze. The main shaft is forged from a billet of steel of special mixture of highest resistant qualities, and is 13 inches at its greatest diameter, with a stroke of 26 inches. This machine exerts a terrific pressure, but does it with the greatest ease. The dwell of the blank holder, when bearing down on the work, covers a greater arc of the circle than is possible with any other system of toggle action. The teeth of all the gear wheels are cut from the solid and the main shaft gear wheel is nine feet in diameter on the pitch line, five-inch circular pitch, fifteen inches face.

The press is timed to make five complete strokes per minute through a gear reduction the ratio of which is 50 to 1. The large balance wheel weighs two and a half tons, is eight feet in diameter, and runs 250 r.p.m. The machine is under complete control of the operator at all parts of the stroke. The press was designed for deep drawing of sheet steel, and especially for the making of crankcases, transmission cases, drawn dashes, axle housings, brake drums and many of the automobile shapes which are now made of aluminum.

DRASTIC MEASURES MUST BE TAKEN.

In its appeal to members of out of the State clubs to respect Connecticut's model law by refraining from all reckless speeding when they tour in the "Nutmeg" commonwealth, the Automobile Club of Hartford sounds a note of warning, the effect of which should be heeded the country over, and that without delay. That the situation, where the criminally reckless use of the automobile by a few, is now very grave is evident from the fact that the national body, the American Automobile Association, has deemed it expedient to send a hurried warning to its 20,000 odd members, scattered throughout the United States, that unless matters immediately improve in this respect drastic legislation is bound to follow next winter, particularly in New York and Connecticut. Other States will naturally follow suit, and all hope of the enactment of a uniform law, or of Federal legislation, will be indefinitey deferred.

It is particularly hard on autoists in Connecticut, which is distinguished for the common-sense leniency of its law, that visitors from other States should so despicably abuse their privileges, leaving in their wake a train of righteous indignation which will react upon the innocent and guilty alike. Conservative estimates place the proportion of reckless speeders at about 10 per cent. of the autoing fraternity, and they may be divided into two classes—*parvenus* with more money than sense, to whom fines are nothing, and professional drivers trying to show off for the benefit of their friends. For these irresponsibles the whole automobiling body must suffer, unless drastic measures are taken to suppress them. Scarcely a day passes but what one of this class is the moving cause of a homicide, or a suicide, though the number who meet a well-deserved fate appears to have but slight effect in depleting the ranks.

Legally, as well as morally, the man who speeds a car from 40 to 60 miles an hour on an open road, and ends by killing some one, is guilty of a homicide, but not until he is considered as such will it be regarded as anything but a pastime. But it should not be necessary to wait until some one has been killed before attempting to impress upon the members of this class that such driving may mean a jail sentence, instead of the slight pecuniary loss that has hitherto been deemed sufficient punishment. Until the 90 per cent. of law-abiding autoists combine with the authorities to suppress all such criminals the obnoxious practice of trapping will continue to snare the good and bad alike, and to keep alive the prejudice against autoists generally that would have no reason for existence otherwise.

* * *

THE JOYS OF AUTUMN TOURING.

No great poet has yet risen to sing the joys of touring. Can it be that even in these prosperous times the poets must still tramp afoot? Can they not even find some compassionate friend to give them a first taste of the road? Surely this is a grave fault, and one that for the good of our literature should be remedied. True, Mr. Kipling knows the touring spirit; he has breathed it into his song of the "Red Gods," who call from the sea, from the Northern lakes and forests, from the jungles of Burma and the snow-capped mountains. The Red Gods call no less strongly from the dusty highroad, and the city dweller hears and goes forth to seek them.

Some remember friends and relatives long unvisited; some must attend a convention in a distant city; but others there are, and these feel the truest joy, who go for love of the going—for the long, warm, quiet hours, the purr of the motor and the rush of the wind. No schedule must be kept, no record broken. They rise early, and start while the sun is still low in the East and the dew sparkles on the grass; they eat their luncheon in the shade by the roadside, and wash it down with cold water from a farmhouse well; and, in the eventide, tired and dusty and hungry, they reach the hotel and rejoice in the supper, the bath and the bed, and the deep, unbroken sleep. Nothing can mar such a day; a wrong turn at the crossroads, it means but ten miles more, and a punctured tire is a source of merriment. Two weeks, or three, may-hap, of that life and a man returns to his desk strong, browned, and clear-eyed, made ready for the work of another year by a process equaled by no other.

Many will take the road this Summer and Autumn for the first time; many others, perhaps, still hesitate, drawn by habit toward the crowded seashore, half fearing this new thing. Try it for a while, at least. Grind in the valves, if they need it; wash out the cylinders with kerosene, and pack the gear-case and differential with fresh grease. Then set out, light of load and light of heart, to learn the road that never ends.

FIRST ENTRIES FOR VANDERBILT CUP CLOSE SEPT. 1

WITH the day of the closing of the first installment of entries for the Vanderbilt Cup race drawing near, the date being September 1, the probabilities point to next week's seeing the beginning of the influx of the final nominations of candidates for blue ribbon racing honors in this country by makers seeking to avoid the double fee to be exacted after the closing up to October 1.

The progress made in the building of tbe 11-mile stretch of the Long Island Motor Parkway, which is to be the home-stretch of the course, and the publicity it has received in the metropolis and throughout the country, have aroused the trade and followers of the sport to the great interest New Yorkers and Americans at large are taking in the annual historic struggle.

The fame and permanent advertising to be gained by a creditable performance in the Vanderbilt Cup contest are appealing strongly to makers and more than one sees a chance, not only of an unequaled speed demonstration of his cars, but of victory itself as the outcome. Not a few are sizing it up as a chance worth taking with stripped cars that have shown themselves easily capable of maintaining an average rate over such a course that will well compare with past Long Island performances and place them far outside of the luck of the racing game.

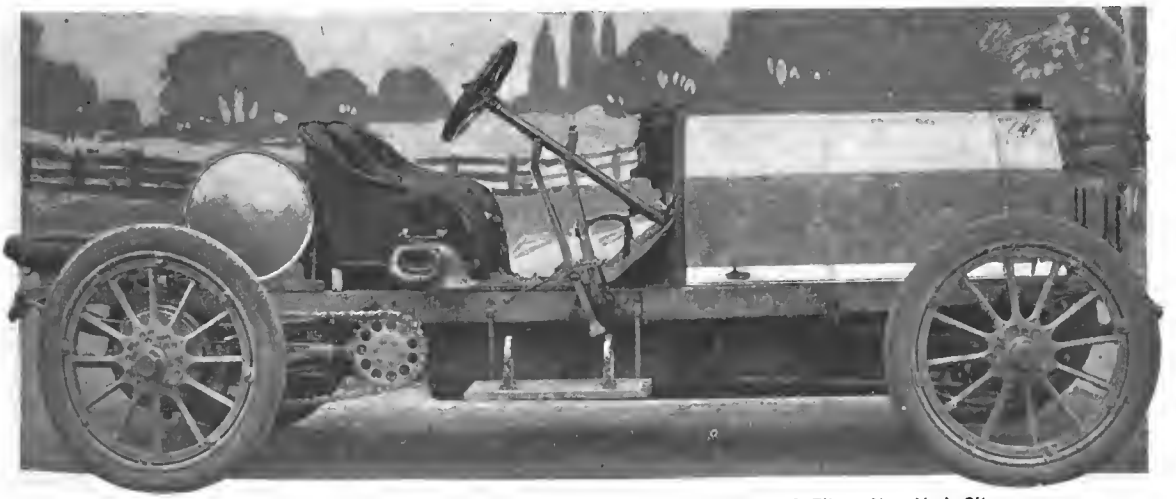
One of the first Vanderbilt Cup cars to be taken on the road is the Acme Six, which was entered by Cordner and Flinn of New York, agents for the Acme in the metropolitan district. The racer is already undergoing its preliminary tests, and as soon as enough of the new cement parkway is completed, it will be taken out on Long Island and tried out over the course. A technical description of the car has already been given in these columns. The engineers at the Acme factory rate the engine at 60-horsepower, and it has been tested up to nearly 2,000 revolutions per minute under constant load for some time.

Club Offers Money and Reiterates Suspension.

The latest news in reference to tbe A. C. A. event at Savannah under European rules is in the form of an announcement that $8,000 will be given in cash prizes to the drivers, divided into $4,000, $2,000, $1,000, $750 and $250. It is an admitted fact that the foreign entries are not quite as plentiful as expected; hence the cash prize offers.

The press notice reiterates the threat of disqualification for Vanderbilt Cup participants "from competing in any future international races held in America or in Europe." It is apparent that the club is prepared to spend a generous amount of money in retaining its greatly prized "foreign relations."

Harry S. Houpt, head of the concern handling Thomas cars in New York City, has accepted membership on the club's contest committee. Much comment has been expressed at the presence of Mr. Houpt on thc committee, in view of the fact that the non-acceptance of the so-called international rules had its principal reason in giving opportunity to the E. R. Thomas Motor Company and the Locomobile Company of America to use racing cars already constructed which would not have been cligible under other rules.



Acme Six-Cylinder Racer Entered in the Vanderbilt Cup Race by Cordner & Flinn, New York City.

FRENCH NOT CRAZY TO RACE IN AMERICA.

PARIS, Aug. 10.—There is something strongly suggestive of the revivalist preacher in the methods of the European publicity writers of the Automobile Club of America. Eternal damnation in the form of disqualification from the Grand Prix, the Ardennes, the Italian races, and even all local events, is painted in lurid colors for the benefit of all those who have dared to cast their eyes towards the cup that will be competed for on Long Island in the Fall. The official publicity man has even gone to the extent of deducting 100 pounds off the maximum weight, announcing in black type that no car must weigh more than 1,100 kilograms. This caused Victor Breyer, the A. A. A. delegate in France, to break his silence, announcing that the weight had been fixed at 1,200 kilograms, and that any car which had competed in the French Grand Prix would be accepted for the Vanderbilt Cup race.

The news having got abroad that Lautenschlager was to drive in the Vanderbilt race, it was the turn of the publicity man to single him out specially, point to tbe error of his ways and ask him point blank to repent while there was time.

A bright note is occasionally brought into the daily epistles by a recital of the prodigious wealth of the club and the men who are behind it. After hearing into what a world of opulence they can enter by engaging in thc Savannah race, the wonder is that entries do not flow. Up to the present, however, all that is announced is a list of the firms who might enter, and the list comprises every important factory in Europe. There appears to be a better understanding of the situation by European manufacturers, and, whether cursed or blessed, they can bc relied upon to enter in tlie race which will give them the greatest amount of material benefit. Of course their American agents will have to help pay the bills, which will be considerable.

Part of State Highway for Lowell's 250-Mile Race.

LOWELL ENTRIES COMING IN RAPIDLY.

LOWELL, MASS., Aug. 17.—Present indications are to the effect that there will be little or no difficulty experienced in obtaining the maximum number of 12 entries fixed for the 250-mile road race to be held here on Labor Day, September 8, for the Butler Ames trophy. In the promotion of this, John O. Heinze, of the Heinze Electric Company and president of the Lowell Automobile Club, is the prime mover, and having successfully overcome the various obstacles which sprung up to prevent the holding of such an event on the Massachusetts highways at an earlier date, Mr. Heinze is now devoting his attention to securing entries. Up to the present, these consist of two Knox cars, drivers not nominated; an American, to be driven by Stewart; a Simplex, for which Lescault has been nominated as driver; a Zust, Al Poole's Isotta and Ralph De Palma's Fiat, while there may be a second Isotta, to be handled by Lewis Strang.

Contrary to the usual custom of starting road races as soon after daylight as possible, the cars will not be sent away until 10 A.M., and the start is to be located at one end of what is known as the "Speedway," which is a 75-foot macadam stretch paralleling the bank of the Merrimac River for two miles. This roadway forms a part of the Lowell park system and it will be turned over to the race promoters for the day. It is supplemented by a 25-foot strip separated from the main road by a grass-bordered walk and trees, which will provide unequalled facilities for parking cars, while the grandstand will be located opposite and at the end of the wide strip in order that the spectators may have a full view of the cars as they come down this broad two-mile stretch, on which phenomenal speeds are anticipated. The stand is to be 1,700 feet long and will have a seating capacity for 10,000 people, while the parking space will accommodate a large number of cars.

Upon leaving this stretch, the course strikes the State highway, which is a macadamized road winding along the Merrimac for a distance of three miles. Including the "Speedway," this constitutes what the promoters term "the main five-mile stretch," which has no turns on it that cannot be easily taken at 50 miles an hour, or better. This stretch ends at Tyngsboro bridge with something like a hairpin turn, though the road is well made and in good condition. Here the cars will strike the backstretch, which consists of a winding country road varying from 10 to 25 feet in width, and having grades ranging as high as 10 to 12 per cent. There is only one bad feature to this part of the course, and that is the presence of the tracks of a street railway on a part of it, but no cars will be run on the day of the race. The entire highway is now being put into first-class condition by the City of Lowell, the Town of Tyngsboro, and the Massachusetts State Highway Commission.

By the day of the race the whole length of the course will have been thoroughly oiled and it will be all wired off. In addition to this protection, there will be 500 to 700 special policemen sworn in by the authorities of Lowell and Tyngsboro. Communication with the different parts of the course will be provided by five telephone stations.

The prize to be raced for is the Butler Ames trophy, presented by Colonel Butler Ames, who is a grandson of Benjamin Butler, and a partner of John O. Heinze's in the Henize Electric Company. The race was originally planned for July Fourth, but it was found that military protection could not only not be obtained, as had been anticipated, but the Massachusetts statutes prohibited the holding of such an event on the highways of the State. But the Lowell Automobile Club, under the auspices of which the race is being held, succeeded in having a special bill put through the Massachusetts Legislature, allowing the use of the public highways for a speed contest.

A ROAD RACE IN FAIRMOUNT PARK?

PHILADELPHIA, Aug. 17.—Next October this city will have a Founders' Week celebration, when all the scattered sons of the Quaker City the world over will hie them back to the old burg to participate in the enjoyable program which is already near completion. One of the sub-committees appointed is the automobile committee, W. Wayne Davis, chairman. This committee believes that the Founders' Week program will lack completeness without some red letter motor event to keep the people interested. To that end the Quaker City Motor Club, through its secretary, H. C. Harbach, has petitioned the commissioners of Fairmount Park for permission to use certain roads in the western section of that popular pleasure ground for the purpose of running off a 200-mile stock car race, the event to be decided between 6 and 10 o'clock on any morning during Founders' Week suitable to the authorities. The club proposes to defray all the expenses of such an event, in return for which it asks for the unrestricted use of the roads on the day of the race and for practice during the early morning hours of the week preceding from daylight to 7:30 A.M. City officials generally favor the scheme, and although there is a speed limit provided for in the Park regulations, there is another proviso which allows the commission to set aside the Park roads for any purposes which it may deem desirable.

Officials of the Quaker City Motor Club, before making the request of the commission, carefully ransacked West Park for a suitable course, and have already evolved a 7 1-2 mile circuit, which, with banking at some of the sharp turns and a cut-off or two, can be made as safe as the average Vanderbilt course. With an aggregate of a quarter-mile of specially built new road, the length of the course could be increased to upwards of 10 miles. Philadelphians—officials and private citizens alike—are naturally proud of their splendid park, and would hesitate to allow any event in its limits which might mar its beauty in any way. But the Quaker motorists have made it plain that while providing a grand public spectacle to add to the Founders' Week hilarity, they will do so at their own expense and restore the roads to their former condition, and there is in consequence a strong sentiment in favor of giving them a chance to make good. The commission has promised to act upon the application and announce its decision at its next meeting; and it is quite generally anticipated that this may be in favor of the race promoters, in which case entries will be obtained at once.

How They Climbed at Algonquin

Leland and the Winning Stearns

Chicago, Aug. 15.—The most unique hill-climb in the country was contested yesterday at Algonquin, Ill., where the Chicago Motor Club successfully ran off its third annual contest. The star performer was F. W. Leland, in the Stearns six-cylinder, who won the trophy hung up by the citizens of Algonquin for the best total time of the day, which included the smashing of the Phillips hill record; the Apperson and Knox getting the mark on Perry hill, the standing start climb in the morning.

Chicago's hill-climb differs from others in that the majority of the events are run under a handicap formula whereby the cylinder capacity is multiplied by the time and this result divided by the weight. Then, too, there is the added novelty of a double climb, one from a standing start up Perry hill, about a quarter of a mile in length and of an average grade of 8 per cent.; while the other is a flying start one-half-mile dash up Phillips hill on the other side of the town, a sporty proposition because it is possible to go up the grade at almost unlimited speed. The two hills are totally unlike. Perry hill has an awkward turn about 100 feet from the start, so it is hard to get up any kind of speed at the beginning, while once around the turn the steepest part of the grade confronts the driver. Near the top there is another turn, but here the grade is not so steep and greater speed is possible. Phillips hill affords a fine take-off, so that as the car flashes over the tape it is at top speed. The rise is gradual, but near the top there is a bad bend which sends the big cars skidding across the road before they can square up for the dash to the tape at the finish line.

The greatest crowd that ever witnessed a Chicago Motor Club event watched the sport. There must have been fully 300 cars, most of them having been driven from Chicago. The climb was the one that was postponed from last May because of the streak of bad weather. For a time this week it looked as if another postponement might be necessary. But the crucial day was perfect so far as the weather and the temperature were concerned. If anything the hills were not quite as good as last May, but the drivers did not seem to mind this, for there was a general shattering of the records that speaks volumes for the speed of this and next year's crop of cars, for mixed in the field were several of the new models, notably the new Chalmers-Detroit and the Model O Apperson. The Knox people had a brace of their 1909 speedsters, a big and a little one, and the latter excelled its mate.

Apperson in "Big Dick"

Knox Star Climber

Salzman-Thomas Flying

Hoffman's Pierce Six

Greiner - Chalmers-Detroit

Brush Single Cylinder

Probably at not another climb in the country has such a brilliant field of drivers assembled. Leland, the star of the day, declared it to be the toughest proposition he had yet been asked to face, and for a time it looked as if the doughty chap from Cleveland would have his colors lowered by George Salzman in the Thomas Flyer. As it was, Salzman was beaten for the Algonquin cup by only three-fifths of a second, certainly a very close margin.

One man nearly spoiled the climb by his poor driving—C. D. Paxson, who had the wheel of a Jackson in Class D. In the morning on Perry hill Paxson showed fast work, but that he did not kill the timing corps was a miracle. He apparently lost control of his car on the last turn and shot to the left-hand side of the road at the top, cutting in between the timers' tent and the poles that held the timing apparatus. The only damage done, though, was the smashing of a megaphone and the scare given F. H. Trego, "Biek" Edwards, and several others on the tape. Instead of barring Paxson from the afternoon effort, the officials let him drive, and as a result he ran amuck at the top of Phillips hill, dashing into the crowd after the bend had been passed and seriously injuring three of the spectators. Paxson himself escaped injury, as did his car as well.

There were five handicap events on the card, two free-for-alls and two events for amateurs. The amateur field had dwindled from last May, though, and Arthur W. Greiner in the Thomas-Detroit had walkovers in both the handicap and the free-for-all. Fifty-two cars had entered, but there were several scratches. There were actually thirty-five cars in the competitions.

Six motor buggies were the first to line up, and of

these the Holsman excelled under the formula, winning first and second places in its particular class.

The Brush single-cylinder tackled a big proposition when it ran with the Buick, Chalmers-Detroit, Jackson and Moline, but it held its own, and under the formula was a winner.

The Model O Apperson, the most recent addition to the Kokomo family, more than made good. It not only won its class, but its handicap percentage was the best of all the cars that competed in the climb. In this line of doping, the Brush was second, the Corbin third, and the Buick runabout fourth.

The Thomas Flyer, Apperson Jackrabbit, and Pierce Arrow had a three-handed battle in Class E, the last of the handicap events, but for the third consecutive year the Pierce won its class laurels and was a most consistent performer.

Then came the two free-for-alls, and with it a pretty fight for the Algonquin cup. The Stearns six, Thomas Flyer, Apperson "Big Dick," the big Knox, and the Stearns four fought it out, and Leland won the class and the trophy, establishing a mark of :29 2-5 for Phillips hill, while the Thomas Flyer did :30.

The Apperson Jackrabbit and the little Knox won the time honors at Perry hill, there being a tie at :24 1-5. The previous mark was :25 3-5, made by Sulzberger in the Stearns last May, although this did not stand, the motor club calling off all performances made at the time. The Phillips hill best was :35 2-5, made last year, although this course was about 100 feet shorter.

WHITE WINS SALT LAKE FREE-FOR-ALL.

Salt Lake City, Utah, Aug. 10.—The Salt Lake City Automobile Club held a successful hill-climb last Saturday on Federal Heights. Fast times were made, and several second [illegible]d

Stripped White Steamer Winning Free-for-All.

off last year's records in all classes. A parade was formed in front of the clubhouse to drive out to the course, and the long line of machines which answered the call bore witness to the growing popularity of the sport. There were nine events, with well-filled entry lists. Jackson, Stoddard-Dayton and Stearns carried off many honors, H. Bracken on the first-named getting first in the $1,500 and $2,000 classes and second in the two $3,000 classes for stripped and fully equipped cars. Stoddard scored first in the $3,000 and $5,000 stripped classes, and Stearns in the $5,000 fully equipped. J. F. Dunn's White won the free-for-all, the only event for which it was eligible, in the excellent time of 1:40. A summary of the free-for-all follows:

Car.	Owner.	Driver.	Time.
White Steamer	J. F. Dunn	F. A. Dundee	1:40
Stearns Six	A. Savage	A. Savage	1:43
Stoddard-Dayton	Sharman Auto Co	C. Selfert	1:47 1-5
Pierce-Arrow	Samuel Newhouse	Bert Fuller	1:48 2-5
Stearns Four	H. B. Lamb	Bert Angel	2:13 4-5
Studebaker	Studebaker Bros.	S. O. Reid	2:24

Prince Henry of Prussia is very content with the proposal to wind up next year's race in South Germany and to hold the speed trial on the flat in Forstenried Park, near Munich. It is quite likely that Austrian territory will be taken in as well.

BUSY DAYS WITH CHALMERS-DETROIT.

Detroit, Aug. 17.—In the Chalmers-Detroit factory the production of 1909 cars is now going forward rapidly. Just at present, the manufacturing departments of the company are concentrating their attention on the Chalmers "30." Salesmanager Counselman reports that he has contracted for 2,802 cars already, 80 per cent. of them 30's. The various departments have been entirely rearranged to secure the greatest convenience in bringing together the parts. The final assembling room, a picture of which is shown above, is 200 feet long and has facilities for the setting up of 50 cars at a time. One of the new 30's is now engaged on an endurance test which should certainly demonstrate the reliability of the car. The plan is to run it two hundred miles a day for one hundred days. The course is from Detroit to Pontiac, Mich., 26 miles each way.

Busy Scene in Chalmers-Detroit Assembling Room.

A COMPETITION FOR TIRE INFLATORS.

Paris, Aug. 12.—A competition for mechanically operated tire inflators will be one of the features of the next Paris show to be held in the Grand Palais during November and December. The idea was put forth last year, but owing to the small number of entries had to be postponed. Any type of apparatus is eligible to compete provided it does not use compressed air prepared in advance. The basis on which the awards will be made is security and strength of the apparatus, 12 points; ease of adoption to automobiles, 8 points; ease with which the apparatus can be used, 12 points; weight and space occupied, 6 points; ease of attachment and dismounting and care of the apparatus, 4 points; selling price, 6 points; rapidity with which tires can be inflated, 12 points; the use of atmospheric air and conditions of its use, 12 points.

Acting Mayor McGowan Welcomes the Thomas Round-the-World Winner at the New York City Hall.

HOME-COMING OF THE ROUND-THE-WORLD WINNER

Two days of well-sustained and enthusiastic greeting signaled the home-coming of the Thomas car, victor in the Paris to New York race, and its crew. On their arrival by the *Lorraine* on Saturday morning, at the French line pier close to two score enthusiasts of prominence in the automobile world were gathered to greet them. They included representatives of the national body, the trade associations, and the local club. Harry S. Houpt and John E. Bowles, of the Harry S. Houpt Company, the entrant of the car; E. R. Thomas, of Buffalo, its maker; F. V. Faurote, of the Thomas factory staff, and Montague Roberts, who piloted it as far as Cheyenne, were the "home folks" on hand. Two of the competing cars in the race were also represented—the Zust, by Walter F. Sykes and A. G. Pisani, of the American company, and the Protos, by Paul Funke. Max Paroutoud, American correspondent of *Le Matin*, one of the promoters of the race, was also on hand.

An octette of cars was on hand to carry the crew and the greeting band to the Automobile Club of America. Into them the guests of honor—George Schuster, driver of the car; George Miller, the mechanic, and George MacAdam, who made the run with them from Seattle as correspondent of the New York *Times*—were placed. The caravan then paraded up Broadway by way of the Wall street district to the Automobile Club of America, where lunch was served and congratulatory speeches made.

E. R. Thomas spoke in appreciation of the services of Schuster, Miller and MacAdam in the race, and the splendid work done by Roberts, Mathewson, and Brinker in this country. He said that the victory of the American flag was more to him than the victory of the Thomas car. He then announced the intention to enter the car in the 24-hour race.

Harry S. Houpt and John E. Bowles spoke for the Houpt Company, which was responsible for the entry of the car. Paul Funke, the Protos car designer, declared the Thomas well merited the victory, and that if the Germans had understood the circumstances there would have been no protest ever made against awarding it full honors. Walter E. Sykes, on behalf of the Zust car which competed in the race, and made a splendid showing in America, paid graceful tribute to the car and crew.

It was announced at the luncheon that the Thomas car was not only the winner of the New York to Paris race, but was likely to be awarded the prize offered by the Grand Duke Vladimir for the first car to reach St. Petersburg. It has been con-

To the right are to be seen Harry S. Houpt, with E. R. Thomas alongside. Next is Reporter MacAdams, of the New York "Times." Then Montague Roberts. New York's temporary Chief Executive is at the wheel, with Schuster in the other front seat, and Mechanic Miller standing alongside.

Hoisting the Winner from the Ship's Hold.

ceded that this trophy would go to the Protos, which actually arrived in St. Petersburg first, but when the American crew was there it was said that the trophy was not for the first car to reach there from Vladivostok, but for the first car from New York to St. Petersburg, and that the trophy would be awarded by the Russian Automobile Club in accordance with the decision of the Race Committee on the main prize. The Thomas car won, as well, the cup given by the New York *Times* for the first car to reach San Francisco.

George Schuster and Montague Roberts jointly win the $1,000 prize offered by Jefferson deMont Thompson, chairman of the A. A. A. Racing Board, to the driver who should carry the American flag first to Paris around the world. Chairman Thompson's making good his offer was sportsmanlike in the extreme and more than generous, in view of the fact that when it was made the schedule of the race called for a run through Alaska, an undertaking that the Thomas car, on its arrival in Alaska, found impossible to carry out, though of all the contestants it was the only one to make the attempt.

The uncrating of the victorious car on Monday was made the occasion of another celebration. Including a motor truck, containing a band and the victorious car, bearing Schuster, Miller, MacAdams, and Roberts, and the escorting machines, there were 24 automobiles in line. The procession paraded through Broad and Wall streets to the City Hall, where the winning crew and Messrs. Thomas, Houpt, and Bowles were received and congratulated by Acting Mayor McGowan in his office. His honor pro tem. then came out and, seated at the wheel of the victor, good-naturedly posed for the camera corps. The procession then continued up Broadway and disbanded at the Houpt garage.

At the Automobile Club of America to-night Orrel A. Parker will deliver a lecture on the race, illustrated by lantern slides. Mr. Houpt is the host of the occasion.

Thomas Emerging from Its Wooden Overcoat.

EIGHTH OF COLUMN, AMERICAN ARRIVAL, PARIS

Paris, Aug. 10.—Germany is not yet at all reconciled to the loss of first position in the New York-Paris race, as is shown by an official protest sent to the *Matin* by the *Berliner Zeitung am Mittag*. Of course no attention can be paid to the protest, the Protos having been officially declared disqualified owing to its departure from the official route. If the Zust finishes, which is practically certain unless some unforeseen accident takes place, it will be given second position to the Thomas. All the glory the Protos can claim is in its record run from Vladivostok to Paris, where, owing to being newly fitted out and repaired, it was able to gain four days on the American car.

The feelings of France in the matter can be gauged by the fact that the *Matin* devoted an eighth of a column to the arrival of the Thomas in Paris, and other journals summarized the event in as many lines.

CAMERON A WINNER OF LIGHT CAR CHALLENGE.

Baltimore, Aug. 17.—As the result of the run-off of the challenge contests inaugurated by the local branch of the Ford company, the Cameron air-cooled car was the winner in two out of three, so that the cup was awarded to it without running the speed trials. The events were the result of a challenge issued by the Ford backers that they would be willing to match their cars against anything selling under $1,500, and the fiat was given due publicity through the daily papers late in July. The challenge

Flag Which Costs Chairman J. de M. Thompson $1,000.

was accepted by the representatives of the Cameron company, three contests being named, an economy run, a hill-climb and a speed test, the cars to be stock machines as per 1908 catalogues, the removal of the mudguards, bonnet and muffler being permitted. All other medium-powered cars were invited to compete, and the Overland was represented. In the economy test, the Cameron representatives insisted that lubricating oil consumption should also figure as a basis for the award, but this was not agreed to by the other contestants. The course was a 65-mile run over as bad roads as Maryland or any other State affords. The results were: Cameron, 1 7-8 gallons gasoline, 1 pint lubricating oil; Ford, 2 5-8 gallons gasoline; Overland, 3 5-8 gallons gasoline, the oil consumption not being stated by the others.

The climb was held on a hill measuring about 7-8-mile, with a grade averaging from 8 to 22 per cent. and with one or two very bad turns. This the Cameron won in 1:35 1-5, the Ford's time being 1:40 1-5 and the Overland, 1:55. As the winning of the two events in succession made it "two out of three straight" for the Cameron, it was decided to abandon the speed trials, much to the disappointment of the backers of the latter, who were confident of scoring another victory. The winning Cameron was a standard stock model with a 3 5-8 by 3 1-2-inch motor and the same gear-set and gear ratio as ordinarily employed. The car made the run over the road from Beverly, Mass., to Baltimore, and was entered without change.

CLUBS THAT ARE AIDING AUTOING'S PROGRESS

ADMIRABLE PLAN OF PHILADELPHIA CLUBS.

PHILADELPHIA, Aug. 17.—Following upon the meeting several weeks ago, in the quarters of the Automobile Club of Germantown, to discuss the formation of an alliance of local and nearby clubs for offensive and defensive purposes, a committee was named last week to bring about uniform action when matters of interest to all come up for consideration. The committee, which consists of one representative from each club, is made up as follows: C. H. Wheeler, chairman, Automobile Club of Germantown; Stedman Bent, Automobile Club of Philadelphia; Edwin S. Nyce, Norristown Automobile Club; John B. Bird, Delaware Automobile Association; A. H. Tomlinson, Delaware County (Pa.) Automobile Club; G. Douglass Bartlett, Quaker City Motor Club, and S. Boyer Davis, secretary and treasurer, Automobile Club of Philadelphia.

The name decided upon for the new body is the "Committee of Allied Interests of the Automobile Clubs of Philadelphia and Vicinity," and among the objects it hopes to accomplish are the preparation of road maps and route information; the erection of warning and direction signs; the repair of roads, if essential, and where it can be effected only by the automobilists themselves; the compilation of touring information, not only in regard to roads, but as to accommodations, garages, repair shops, and stations, and where gasoline and oil may be purchased, and the care of local legislation (city and township ordinances).

In the past all of the clubs represented have done more or less work, in a desultory fashion, along the lines represented above, and it was pointed out at the preliminary meeting how much more effectively—and economically—this work could be done if all hands would combine. When a matter of vital interest to motorists of this vicinity confronts the clubs in the future, there will be no separate meetings of the clubs, the naming of separate committees, and the incurring of expenditures, which, in the aggregate, would amount to quite a respectable total. Instead, the matter will be turned over to the Committee of Allied Interests, which has full power to act.

The majority of the committee are lawyers, and, in the event of the necessity for quick action in matters affecting legislation, this is a decided advantage. In such work as the signhoarding of the roads, and the erection of warning notices, the saving that will be effected in the future through the impossibility of duplication will in itself be considerable.

The new committee will get to work at once and outline a system of procedure. Meetings will be held upon the call of the chairman, and with the advantage of compactness quick results may be looked for when it tackles any proposition.

MINNEAPOLIS CLUB'S INCREASING MEMBERSHIP.

MINNEAPOLIS, MINN., Aug. 17.—The Minneapolis Automobile Club, which now ranks among the foremost in the country in membership and activity, has decided upon another campaign for members. The opening of the new country clubhouse, 16 miles from the city, is the motive for the new activity, and the principal inducement offered is the remission of the initiation fee. There has been a rush of autoists to the club rolls, and it now numbers over 700 of the 1,900 automobile owners in the city. A hill-climbing contest is announced for August 29, and entries are rapidly coming in. The new rules of the A. A. A. will be used.

A PLAN TO EDUCATE THE FARMERS.

BEAVER FALLS, PA., Aug. 17.—The Beaver Valley Motor Club will give the farmers a tour over the surrounding country in automobiles on farmers' day during Old Home Week. The idea is to demonstrate to the farmers the importance of good roads and to overcome their prejudice against automobiles.

LONG ISLAND CLUB IS GAINING STEADILY.

BROOKLYN, N. Y., Aug. 17.—The annual handbook of the Long Island Automobile Club for 1908 has just been issued, and comprises an attractive little volume bound in green linen-covered boards with the name of the club stamped in gold. The frontispiece is ornamented with a half-tone plate giving portraits of President Charles Jerome Edwards, Vice-president Dr. C. B. Barker, Treasurer Louis T. Weiss, and Secretary Russell A. Field, in addition to photographs of the city headquarters and garage at 360 to 366 Cumberland street, Brooklyn, and the country home at Bay Shore, Long Island. Heading the membership list, which follows the constitution and by-laws of the club, are the names of President Roosevelt, Timothy L. Woodruff, and William J. Youngs, as honorary members. The club was incorporated November 27, 1900, and a feature to be noted in glancing through the membership list of the 1908 year book is the number of founder members who are still actively engaged in forwarding the interests of the organization. These include Louis R. Adams, A. R. Pardington, and Frank G. Webb. Another prominent member is William K. Vanderbilt, Jr., he having joined November 11, 1901.

The club may well be proud of its progress during the eight years of its existence, as represented by this latest issue of its year book. The membership is nearing the 500 mark.

MANY ENTRIES FOR BOSTON'S ENDURANCE RUN.

BOSTON, Aug. 17.—Rules and entry blanks for the twenty-four-hour endurance run which is to be conducted by the Bay State Automobile Association, September 23, were issued to-day. The run will cover a distance of approximately 275 miles, the route being from Boston to the White Mountains and return, the outward trip being along the north shore through Newburyport, Portsmouth, Rochester, North Conway and the Crawford Notch to Bretton Woods, and the return trip being through Bethlehem and the Merrimac Valley. Motors must be kept running, with the exception of a two-hour stop at Bretton Woods, and a one-hour stop at another point for luncheon.

In drafting the rules for this contest the committee has kept in mind that it is intended to be a thorough test of the reliability of the cars rather than a test of the endurance of the drivers. As it is a test of cars only, the rules permit the carrying of spare drivers and changes may be made at any of the controls upon notice to the checker. There will be three controls each way outside Boston and Bretton Woods, so the trip will not be arduous on the pilots. Another excellent feature of the rules is the requirement that the observers shall all be practical operators, acceptable to the committee. This is to insure a complete and careful record of the actual performance of each car. The test will start at 10 A.M., September 23, and is expected to finish early in the afternoon of the following day. If there is one positive winner a silver cup will be awarded; if there is a tie all perfect score cards will be given certificates. The driver making the most consistent performance will be awarded a gold watch.

During the daytime a pilot car will mark the route with confetti; at night the pilot car will carry a red searchlight on the rear and will precede the leading competing car by two minutes. There are to be two classes—A, for touring cars, and B, for runabouts, roadsters and tourabouts. Enough entries have been assured to make it evident that at least 50 cars will participate.

POPULAR SUBSCRIPTION FOR JERSEY LAW TEST.

NEWARK, N. J., Aug. 17.—Having retained the Hon. John W. Griggs, ex-governor of New Jersey and ex-attorney general under President McKinley, and Charles Thaddeus Terry, as counsel to fight the constitutionality of the obnoxious Freylinghuysen law, it has been decided by the joint committee of the

Associated Automobile Clubs of New Jersey and the New Jersey Automobile Trade Association, to make the matter a popular movement by giving Jersey autoists generally an opportunity to register a protest against such unreasonable and unfair treatment by subscribing to the fund for the payment of attorneys' fees and the costs of testing the constitutionality of the law. Subscriptions will be received by any of the committee, or by the treasurer, R. A. Greene, 90 Washington street, Newark, N. J. The committee consists of the following: W. C. Crosby, J. H. Edwards, G. F. Blakeslee, R. A. Greene, George Paddock, A. H. Darnell, George A. Post, Joseph H. Wood, secretary.

CLEVELAND CLUB TO HOLD A RELIABILITY RUN.

CLEVELAND, Aug. 17.—After considerable urging on the part of dealers in this city, the Cleveland Automobile Club has consented to act as the sponsor of a reliability run, to be held some time during September or the first part of October. The representatives of such cars as the Pierce-Arrow, Stoddard-Dayton, Knox, Chalmers-Detroit, Gaeth, Regal, Cartercar and others have promised at least one entry each, and are enthusiastic over the project. A few years ago, Cleveland was a center of automobile events of all kinds, and now it is coming to life again.

WORCESTER CLUB HAS NEW SECRETARY.

WORCESTER, MASS., Aug. 17.—Herbert M. Sawyer, until recently secretary of the Board of Trade, has been notified of his election to the office of secretary of the Worcester Automobile Club. He will enter upon the duties of his new position this week. Mr. Sawyer will also be made a director of the club, in order that he may represent it at legislative hearings and meetings of State clubs and associations. In the past most of this work fell upon John P. Coughlin, president of the club.

NEW JERSEY CLUB IS OILING ROADS.

TRENTON, N. J., Aug. 17.—The Mercer County Automobile Club is furnishing and applying oil to some of the country roads, as an experiment in abating the dust nuisance. It is hoped that this method will be adopted by the State in all road construction. This will also preserve the farmers' crops from injury by the dust which settles, and incidentally blinds the automobilist who is in the wake of another car. This example should be followed by other automobile clubs, as it helps to secure better legislation.

OILING ROADS IN COUNCIL BLUFFS, IA.

COUNCIL BLUFFS, IA., Aug. 17.—At a meeting of the recently organized automobile club of this city it was decided to make the experiment of oiling McPherson avenue from the Chicago, Milwaukee & St. Paul tracks to the paving on East Pierce street. The cost is estimated at $150.

HARTFORD CLUB'S PROTEST BRINGS RESULTS.

HARTFORD, CONN., Aug. 17.—As the result of the constant and bitter complaint that has been made for some time past by prominent members of the Automobile Club of Hartford, the notorious "hen-coop bridge" stretch is to receive attention, and others that are in the same class with it will be repaired. The Highway Commissioner has been stirred to action, and the bad spots will be taken in hand at once.

FORTY ENTRIES FOR BRITISH FOUR-INCH RACE.

LONDON, Aug. 12.—Total entries for the British Four-Inch Race, the limited bore event to be held on the Isle of Man, Thursday, September 24, stand at 40, five additional cars having been put in at double fees. The late comers are two S. C. A. T., a Vinot, a Piccard, and a Rover. The course on which the race is to be held is about 38 miles round; having to be covered nine times the exact total distance is 350 miles. A large portion of the old Tourist Trophy route has been selected.

REMARKABLE ECONOMY DEMONSTRATED.

HARRISBURG, PA., Aug. 17.—The first economy test of the Motor Club of Harrisburg, held last Saturday, brought forth some splendid records, a single-cylinder Cadillac, a 1903 model, being used as a grocerman's delivery wagon, securing a mileage of 38 1-2 miles on the gallon of gasoline allotted to each contestant in the test. Andrew Redmond, driving a Columbus electric in the electric class, covered the remarkable distance of 140 miles on a single charge, requiring twelve hours for making the run, as the cars most economical speed was 12 miles.

The contest was held over a four-mile course laid out on the paved streets of the city, and attracted more attention than any other contest ever held in Central Pennsylvania. Splendid scores were made in all the classes, the only requirements being that the cars should carry capacity of passengers and travel around the course until the gallon of gasoline had given out. This contest will be followed by a road test of 100 miles in September. There were eight classes, and the results were as follows:

CLASS NO. 1—SINGLE-CYLINDER CARS.

1.	Cadillac	Harrisburg Auto Co	23.9
2.	Reo	George W. Myers	38.5

CLASS NO 2—TWO-CYLINDER RUNABOUTS.

1.	Jackson	Motor Vehicle Co	31.6
2.	Maxwell	John Sellers	31.3
3.	Ford	C. L. Scott	26.5

CLASS NO. 3—TWO-CYLINDER TOURING CARS.

1.	Maxwell	Andrew Redmond	33.2
2.	Jackson	Motor Vehicle Co	30.2
3.	Maxwell	F. H. Baumgardner	18.3

CLASS NO. 4—FOUR-CYLINDER RUNABOUTS UNDER $1,000.

1.	Buick	Central Pennsylvania Auto Co	28.6
2.	Ford	Harrisburg Auto Co	22.4

CLASS NO. 5—FOUR-CYLINDER RUNABOUTS, $1,000 TO $2,000.

1.	Franklin	Paul Messner	32.6
2.	Pullman	Robert Morton	24.2

CLASS NO. 6—FOUR-CYLINDER TOURING CARS UNDER $2,000.

1.	Pullman	J. A. Kline	27.6
2.	Franklin	Frank Oenslager	21.5

NO. 7—FOUR-CYLINDER TOURING CARS, $2,000 OR OVER.

1.	Cadillac	C. C. Crispen	27.5
2.	Franklin	Central Pennsylvania Auto Co	17.5
3.	Pullman	W. F. Graupner	15.8
4.	Stoddard-Dayton	J. M. Jaycox	13.6

CLASS NO. 8—FOUR-CYLINDER RUNABOUTS, $2,000 OR OVER.

1.	Cleveland	G. L. Strayer	20.2
2.	Pullman	E. G. Irvin	19.0

CLASS NO. 9—(Exhibition Run on Single Charge.)

1.	Columbus Electric	Andrew Redmond	140.0

A WESTERN NEW YORK SPEED TRAP.

FREDONIA, N. Y., Aug. 17.—Practically the whole township of Portland, which is between Fredonia and Westfield, is interested these days in trapping the unsuspecting autoist. Portland is on the main road between Buffalo and Erie and is traveled by many automobilists, who in the future will do well to inquire at Fredonia when westward bound as to the operating of the Portland trap, and when coming eastward the same sort of inquiry should be made at Westfield. Rather than waste time in fighting the trap, the average autoist has contributed to the Portland town treasury, and continued his journey in a cussing frame of mind.

WHITES CARRY PORTO RICO PASSENGERS.

Charles H. Martin, who several years ago established a line of Knox 'buses between Ponce and San Juan, is back in Porto Rico. He has been there a month engaged in re-establishing an automobile passenger line between these two points. This time he is acting as agent for the New York branch of the White Company. Already enough White steamers have been installed to insure a daily trip each way. Touring cars only are used, as only passenger traffic is sought. Mr. Martin is engaged in the formation of a local motor transportation company between the points named.

A. A. A ISSUES GENERAL WARNING AGAINST RECKLESS DRIVING

NEW YORK, Aug. 15.—The American Automobile Association has sent a hurried notice to its 20,000 odd members, scattered throughout the country, to the effect that drastic anti-automobile legislation will be enacted in several of the eastern States, and particularly Connecticut and New York, at the coming sessions, if reckless speeding is not stopped. This action grows out of the request made by Secretary G. K. Dustin, of the Automobile Club of Hartford, that visiting autoists respect the law of Connecticut, as otherwise it would be repealed, as well as out of attitude of the authorities of Nassau county, Long Island, who are determined to suppress reckless driving to the common danger. The Association has always condemned speeding, and the attitude of President W. H. Hotchkiss, and Charles T. Terry, of the Legislative Board, has been made public on numerous occasions during the past year.

On Wednesrday last, Mr. Terry and Secretary Elliott attended a hearing before the supervisors of Nassau county, who have announced that they will send all speeders to jail, unless the A. A. A. and its affiliated clubs can bring about the necessary reform by moral suasion. The Long Island Automobile Club was represented by F. G. Webb, chairman of the club's committee on public safety; W. P. Richardson, L. T. Weiss, Russell A. Field and C. C. Cluff, while the Vanderbilt cup commission was represented by Chairman Jefferson de Mont Thompson and A. R. Pardington. The representatives of the different automobile bodies prescnt were all thoroughly in accord with the attitude of the Nassau county supervisors, which reflects, in a large measure, that of local authorities all over the country. Halstead Scudder, counsel to the board, stated that he had been authorized by the supervisors to notify the representatives of all automobile bodies that speeding must stop at once, or the most cxtreme measures permitted by the law will be enforced. Mr. Scudder has been collecting statistics of the fatalities on Long Island due to speeding, and divides them into murder, homicide, suicide and assault with intent to kill, classifying the autoist who drives a machine without respect to the rights of other vehicles at crossings as a plain outlaw, bent upon murdering some other user of the highway, or on committing suicide.

In its warning, the American Automobile Association states that it is the duty of every one of its members to heed it personally, as if the present undercurrent of feeling is allowed to grow and spread, it will result in the enactment of laws in the different States, of so radical and violent a character, that it will be impossible for the Association to ever secure the passage of a Uniform State motor vehicle measure, or a Federal Automobile bill, for which it is now putting forth every effort.

Two White Steamer Ambulances Which Have Been Built for the U. S. Navy.

AUTO TRANSPORTS ONLY IN FRENCH ARMY MANEUVERS

PARIS, Aug. 12.—For a period of fourteen days over 100,000 men will be dependent on the automobile for food and drink, the French army authorities having decided to use mechanical means of transport exclusively in the next maneuvers to be held in the neighborhood of Blois, Tours, and Chateroux. A total of eighty vehicles are required to carry victuals to the 4th, 5th, 8th and 9th army corps which will be in the field. As the army does not possess this number of vehicles, an appeal has been made to manufacturers to meet the deficiency by the loan of automobile trucks and drivers.

Although the pecuniary advantage is but slight, there is little doubt but that the eighty trucks will be supplied by French manufacturers, and that the horses of the army service corps will be left without work during the military operations. The indemnity to manufacturers is at the rate of 20 cents per horsepower per day, fuel, oil and grease being provided by the army. Drivers are allowed a special indemnity of 50 cents per day, which is really handsome treatment compared with the one of five cents received by the privates in line regiments. In practically every case the men having charge of the military automobiles will be workmcn of the firm engaging their vehicle, who are liable for service as reservists in the standing army. Special facilities are allowed by which men who would normally have to pass 15 or 28 days in some other branch of the army are allowed to fulfil their military duties at the wheel of one of their employer's army service wagons.

The usual method of procedure during the maneuvers is for the automobiles to be divided up into groups according to their power and speed, a certain number being allotted to each army corps. Every morning at daybreak the automobile convoy, under the charge of an officer who regulates the speed and sets the line of march, starts out for the camp which it is required to furnish with provisions, and water if necessary. The average distance from the base to the fighting line is from 30 to 35 miles. It is not always over the main roads, for as the troops move away from the centers of civilization the wagons have to follow them. Usually by noon the loads have been discharged, and after lunch at the camp or on the roadside the convoy sets out empty for the army base. If there is any necessity for it, the sick men of the troops are carried back to the headquarters.

Navajo Indians Up-to-Date Transported.

This party of Navajo Indians in the Studebaker Truck Was Photographed During the Meeting of the National Education Association in Cleveland. They Seem to Be Enjoying Themselves.

Strenuous Hill-Climb Test for Ramblers.

All Rambler Cars Before Leaving the Factory Must Prove Their Hill-Climbing Ability on This Inclined Track, with Grades of 20, 30 and 40 per cent.

CANADIAN ARMY WILL HAVE AUTO CORPS.

MONTREAL, Aug. 10.—The experience of the Canadian Army Service Corps with automobile transportation at Quebec's recent tercentenary celebration will probably result in the establishment of an automobile corps like that in England. Colonel Biggar, the chief of the Service Corps, will go to England on special leave to study the system in force there. It is proposed that all automobiles and traction engines in use in Canada be registered at Ottawa for this purpose.

RACE MEET TO BE HELD AT MONTREAL.

MONTREAL, Aug. 10.—R. M. Jaffray, acting for the Automobile Club of Canada, is promoting a three-day race meet and gymkhana, to be held in Montreal August 28, 29, and 30. The fast and well-banked track at Delormier Park has been secured and a large number of entries are assured.

"Great Western" Tackling a Tough Climb.

The Testing Track of the Model Automobile Company Seems to Run through a Washed-Out River Bottom. This Is Only a Part of the Test Given All of This Company's Cars.

DEFY N. A. A. M., A. M. C. M. A., AND A. A. A.

The Motor Racing Association, a New York organization, made up of four importers, two makers, and two local agents, first organized as the Metropolitan Motor Association, has decided to run its two-days' meet at the Brighton Beach track on Friday and Saturday, September 18 and 19.

At the meeting last Friday night, at which the dates were fixed, it was decided to ask for no sanction from the race governing body. The reasons for this action are stated in the official announcement of the proceedings to be: "In order to obviate the necessity of taking sides in the existing controversy between the A. A. A. and the A. C. A., it was decided to hold the meet without asking for the sanction or approval of any organization." This is in opposition to the policy of supporting the national body, formally decided upon by the N. A. A. M. and the A. M. C. M. A., representing the American trade.

Carter-car Automobile Stage Which Daily Climbs Mount Hamilton.

Climbing Mount Hamilton.—To the thousands of tourists who visit California every year one of the most interesting side trips is that up Mount Hamilton to the world-famous Lick Observatory. Heretofore this has always meant a long and tedious journey, as a stage coach was the usual means of ascending the mountain, and many have grown discouraged and abandoned the trip when they discovered this. Such was the state of affairs when John H. McGehee, of Lechter's Garage, San José, was struck by the idea that an automobile stage would be an improvement. After considerable investigation he decided to purchase a friction-driven Carter-car for the purpose. The photograph shows the car at its daily work. The road has an elevation of 2,100 feet in a distance of seven miles. Although the picture was taken in July, it shows the ground and shrubbery covered with snow.

Another Packard Stunt.—Still looking for new worlds to conquer, the Packard Motor Car Company has established another testing route on the old State Road between Philadelphia and Pittsburg. Automobilists who have toured in all parts of the country agree that no known route affords finer scenery, with every kind of going, good, bad and indifferent, than this. The Packard camp is located at McConnellsburg, and a number of cars of different types are at present undergoing speed and endurance trials there. In charge of operations are H. B. Joy, the general manager; S. D. Waldron, assistant general manager, and M. J. Budlong and E. M. Moriarity, representatives in New York and Kansas City, respectively.

Carriage Builders Take Up Autos.—The C. T. McCue Company, Hartford, Conn., which has been prominent in the manufacture of running gears for horse-drawn vehicles for a number of years, has decided to take up the building of automobiles. It is understood that most of the parts for the new car, which is to be known as the McCue-Hartford, are to be supplied by the Billings & Spencer Company, F. C. Billings, of the latter firm, also being vice-president of the McCue Company, and that the latter will merely assemble. The new car is an attractive looking machine, and it is understood that an initial order for thirty like it has already been received from the South.

Logan Reorganization.—B. A. Gramm and Fred Bisantz, formerly engineer and superintendent, respectively, of the Logan Construction Company, Chillicothe, O., which recently failed, have organized the Gramm-Logan Motor Car Company, which will be located in the northern part of Ohio. The plant has already been erected, and announcements will soon be made.

Tires in the East Indies.—The experts of the Netherlands Rubber Company, of Singapore, Straits Settlements, who have been investigating the various makes of tires upon the market, have finally decided to adopt the Swinehart. This Akron, O., company claims that fully 90 per cent. of the solid tires for automobiles made in the world are made under its patents.

Winton Prize Contest.—The second annual $2,500 prize contest for Winton Six Chauffeurs will start November 1, 1908, and end June 30, 1909. Any employed driver of a Winton Six, whether of the 1908 or the 1909 model, is eligible to compete. The contest follows the same plan as the last one, the results of which were announced recently.

Premier Home Again.—The "100 Miles for 100 Days" Premier, which acted as press car with the Glidden Tour, has returned to Indiana, and is now making a tour of the cities near Indianapolis. The car has already covered three-quarters of the intended distance. It is still using one of the original set of Fisk clincher tires.

Postal to Be Built in Cincinnati.—The Postal Auto & Engine Company, of which Clarence E. Runey is president, and which builds the Postal buggy type of car, is now removing its plant to Cincinnati. New models for the season of 1909, consisting of several additions to the Postal line, will shortly make their appearance.

Logan Company Fails.—The Logan Construction Company, of Chillicothe, O., which is engaged in the manufacture of automobiles and auto-trucks, has filed a petition in bankruptcy, with assets of $69,000 and liabilities of $120,000.

Waukesha Company Enlarges.—The Waukesha Motor Company, of Waukesha, Wis., are completing designs for a new building to be erected in Waukesha, which will triple their present capacity.

IN AND ABOUT THE AGENCIES.

Atlas.—The Atlas Motor Car Company, of Springfield, Mass., has discontinued its agency in New York, and has established a branch house at 1876 Broadway, under the management of E. H. Sherwood, formerly with the Aerocar.

Autocar.—Beginning September 1, the Autocar, formerly represented in Philadelphia by the General Motor Car Company as agents, will be exploited in the Quaker City through the medium of a branch.

Peerless.—The Peerless agency in Boston is preparing to enlarge their salesrooms by taking over the adjoining store, which was previously occupied by the Diamond Rubber Company.

Panhard Oil.—The G. A. Haws Company announces the appointment of the Beckley-Ralston Company, 80 Michigan avenue, Chicago, as Chicago distributors for Panhard oil.

Cadillac.—The Lubeck Automobile Company, of Grand Rapids, Mich., has taken over the agency for the Cadillac, formerly sold in that city by C. J. Bronson.

Lozier.—On September 1 the General Motor Car Company, agents for the Lozier in Philadelphia, will remove to the new building at 227-229 North Broad street.

Havoline Oil.—T. E. Hamilton has opened a salesroom on Boylston street, Boston, Mass., and will handle Havoline oils exclusively.

PERSONAL TRADE MENTION.

James E. Murray, secretary of the New York Sporting Goods Company, 17 Warren street, New York, has returned from a two-months' vacation in New Hampshire. He will be pleased to have manufacturers of accessories send 1909 quotations for the company's new catalog.

Robert Morton, who has been acting as head inspector and tester for the Pullman Company, of York, Pa., will in the future be attached to the staff of the Keystone Motor Car Company, and will look after the Pullman interests in Harrisburg.

F. A. Babcock, Jr., has succeeded C. M. Atterbury as manager of the Chicago branch of the Babcock Electric Carriage Company, 1330 Michigan avenue. Mr. Babcock has started on a tour of inspection of the various agencies in his district, covering the whole distance in a Babcock.

Alexander Winton received an unusual honor last Saturday at the hands of the Lakewood Yacht Club, of Cleveland, of which he is commodore. That day was set apart as "Commodore's Day," and was celebrated with a squadron sail, salutes, etc.

Percy Owen has joined the sales forces of Carl H. Page & Company, Broadway and Fiftieth street, who are agents for the Chalmers-Detroit line. He will also continue to handle the Bianchi.

E. B. Olmsted, for the past five years secretary and general manager of the Autocar Equipment Company, of Buffalo, N. Y., has resigned to accept the position of vice-president and general manager of the American Motor Truck Company.

Allan Miller, sales manager of the Reliable Dayton Motor Car Company, is making a three-weeks' trip to northern Illinois and Iowa in a Reliable Dayton Type F, taking in the Iowa State Fair at Des Moines.

H. P. Maxim, designer of the Maxim-Goodridge electric, is taking his vacation on an automobile trip through the New England States.

THE AUTOMOBILE

How Wilbur Wright "Motored" at Le Mans

By W. T. Bradley

LE MANS, Aug. 20.—Wilbur Wright is the hero of the hour. His machine lies in the wooden shed on the Hunaudieres racecourse with one wing completely broken, and is not expected to be out again for a week, but even in his accident the American aeronaut has triumphed. It happened on Thursday morning last, after a more than usually brilliant flight that had caused Engineer Surcouf, of *Ville de Paris* fame, to exclaim: "Our machines are but children's toys."

On the previous days the crowd had been too big for Wilbur Wright's ideas of seclusion, and, instead of flying in the evening, the aeroplane was brought out of the shed which it shares with its pilot and placed on the wooden starting rail at 6 A. M. A few minutes after seven, all being ready, attachment was made to the catapult, the motor started, and the apparatus sent spinning through the air. For 8 min. 13 2-5 sec. it evolved over the ground, making big sweeps, cutting short to swing round as if on a pivot, flying over the tree tops at a height of 80 to 85 feet, then descending to twenty feet from the ground, to mount up again a moment later, all being done in a fresh northwest breeze that would have sorely troubled any other sky pilot.

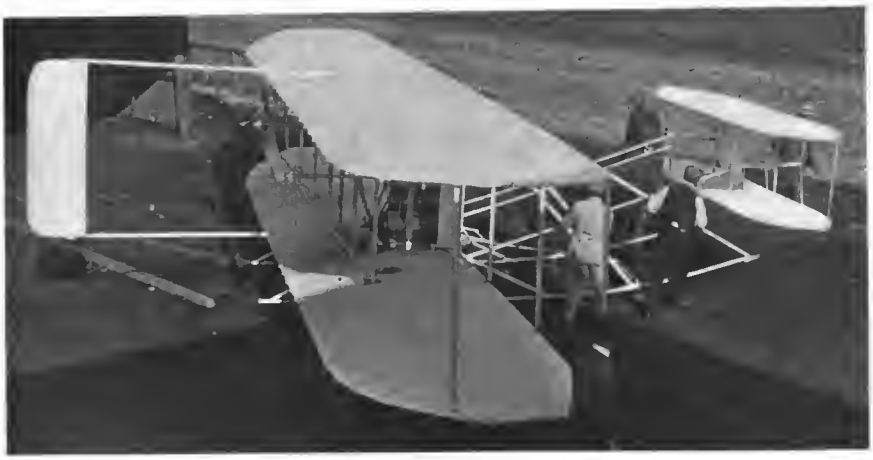
When he had had enough of it, the apparatus was brought nearer to earth, the engine cut out, and the artificial bird allowed to gracefully settle down on its wooden skates, the operation being performed with such gentleness that not a tremor was observable on the canvas frame. Half an hour later the apparatus was off again, but from the first it was noticed that the motor was missing. Nevertheless, Wilbur Wright mounted to a height of 90 feet, the highest altitude ever attained by a heavier-than-air machine in France, and appeared to be little troubled by the irregular firing of his engine. After remaining a minute in the air and describing a huge circle, the aeroplane was brought to about 30 feet from the ground, the engine cut out, and a gentle gliding movement downwards begun. Suddenly it was seen that the machine was heeling more than usual, the left wing touched the ground, there was a sound of breaking spars, and a second later the aeroplane had collapsed. As soon as Wilbur Wright had extricated himself from the wreckage, without a scratch to show for his fall, he explained that, seeing he was about to alight on a mound of earth, he had tried to change the direction of the machine, but owing to insufficient training pulled the lever the wrong way, with the result that the left wing struck the object he was trying to avoid. Since coming to France the controlling mechanism of the aeroplane has been changed, all operations now being performed by two levers only; when in the States there were four levers, two being operated by Wilbur and two by Orville Wright. It was owing to inexperience with this system that the accident happened.

Though the person most interested looked upon the false movement as a piece of stupidity, the public regarded the descent as a triumph, for by it Wilbur Wright had proved that the stoppage of the engine was not a source of danger, the operation of coming to earth having been performed with the ease and certainty of a powerful bird.

On the Wednesday morning, also about 7 o'clock, an excellent flight, lasting 6 min. 56 2-5 sec., was made in a fresh breeze, and at a height which at one moment reached 80 feet. Eight rounds were made of the racecourse at a speed averaging 35 miles an hour, the distance covered being about five miles. It was not a long-distance test, however, for the machine was changed in direction every minute or so, various figures being described to the astonishment of the spectators, none of whom had ever before seen such work in a 10-mile-an-hour breeze. On the evening of the same day two other attempts were made, but the first only lasted 40 seconds and the second 1 min. 45 sec. The wind was rather strong, and Wilbur Wright preferred not to take any risks, declaring that he could fly with ease if his brother were there to help him control the machine, but that the operation was difficult for one man.

Wright and Kapferer at Le Mans.

Tuesday's flight, executed late in the evening, consisted of three com-

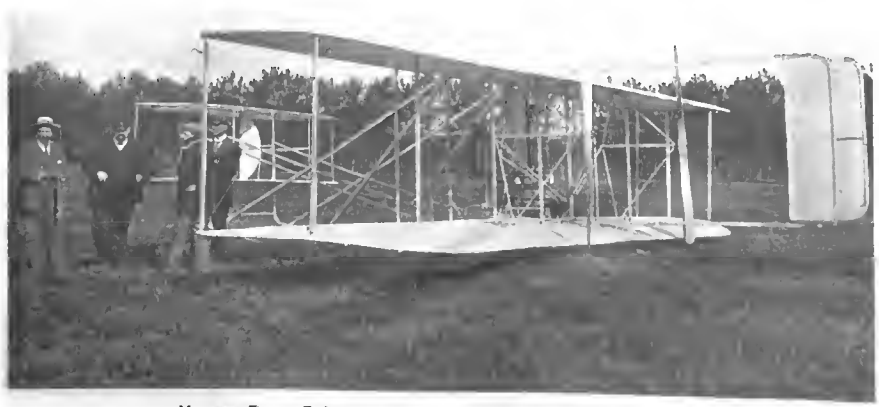


Bringing Aeroplane from Its Shed Before a Flight.

plete circles of the racecourse in 3 min. 43 sec., at a speed of 38 miles an hour. On Monday two successful flights were made, the first of 42 seconds, the second of 1 min. 41 sec. Though remarkably successful work has been done, these flights have been undertaken entirely with a view of familiarizing the operator with his machine and the ground, no attempt whatever being made to break records. This is shown by the progressive nature of the flights, which are as follows:

Saturday, August 8	1 minute, 45 seconds.
Monday, August 10	False start.
	42 seconds.
	1 minute, 41 seconds.
Tuesday, August 11	3 minutes, 43 seconds.
Wednesday, August 12	40 seconds.
	1 minute, 45 seconds.
	6 minutes, 56 2-5 seconds.
Thursday, August 13	8 minutes, 13 2-5 seconds.
	1 minute, height record of 90 feet, broke wing in descending.

So complete has been the triumph of Wilbur Wright that in French aeronautical circles there is only one opinion on the abilities of the man from Dayton. Such practical aeronauts as Delagrange, Surcouf, Kapferer, and Zens declare that the results are marvelous, far surpassing anything they ever thought possible. It must be remembered, too, that the majority of French aeronauts were firmly convinced that the Wright brothers were huge bluffers. The most astounding thing is that two men should, alone and unaided, have worked at such a problem and achieve success with the scanty means at their disposition. For the machine which has astounded the world is the exclusive work of Wilbur and Orville Wright; even the engine is the production of the brothers from Ohio.



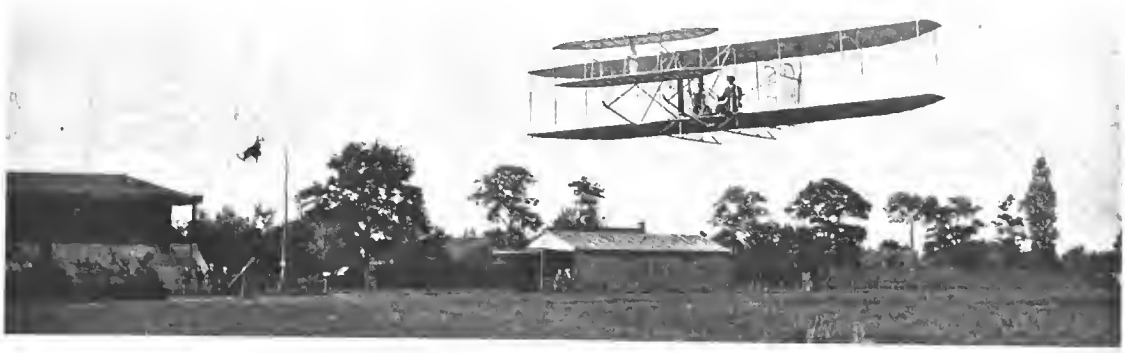
Messrs. Berg, Bollee, Kapferer and Wright Beside Aeroplane.

It is here that there is room for criticism, but even the criticism sounds strangely like praise. The motor and aeroplane have been built by the two brothers, and as it is practically impossible for any two men with rather limited means to show such results as the best factories, manned by experts in the different branches, there are things that the technical man can quibble at. The motor, declared one engineer, looks as if it had been made by a clever village locksmith. The framework is ingenious and strongly constructed for use, but it has not the fine finish of the French machines. The latter, however, fly with a certain hesitation, as if they had not yet got out of their swaddling clothes, while the Wright apparatus is a mechanical bird that has been bred to the air. There is this difference between the American and the French machines, that the former has grown up with the men who operate it, and is the result of years of long study and practice; the latter have been made by skilled workmen who have never flown, and have been handed ready-made to men who have not yet obtained many of the secrets of the birds.

In principle there is little difference between the machines used by Farman and Delagrange and that of the Wright brothers. The closest resemblance lies with the apparatus with which Santos-Dumont, in 1906, first made a mechanical flight in Europe, for the Brazilian's machine, unlike those which immediately followed, had no tail and had its elevation planes in front.

The Wright machine consists of two superimposed, slightly concave wings, 40 feet from tip to tip, and distant one from the other about eight feet. They are mounted across the rear end of a couple of runners having a strong resemblance to the runners of a sleigh. In front are two smaller superimposed planes, the object of which is to provide for the ascension and descent of the mechanical bird. Naturally, these are pivoted, and can be controlled by the pilot. To the rear are two vertical rudders, made like the wings of a wooden frame covered with canvas. Between the two elevation planes is a small vertical rudder connected with the large ones in the rear, and designed exclusively to act as a tell-tale.

Midway on the lower wing is the 25-horsepower four-cylinder gasoline motor which has come in for so much criticism in France. Though it has given satisfactory service, it is certain that better results could have been obtained by the adoption of one of the light-weight engines put on the market by specialists in aeronautical work. The Wright brothers, however, appear to have taken a pride in constructing the entire apparatus themselves. The engine is the ordinary automobile article, with detail modifications. The cylinders are separate, surrounded by copper water jackets, camshaft within the crankcase operating overhead valves by means of rocker arms. The carbureter has been abolished in favor of direct fuel-feed by means of a pump and distributor mechanism. Ignition is by means of high-tension magneto driven off the camshaft through gears outside



Wright Aeroplane in Successful Flight at Fair Grounds, Le Mans, France.

the crankcase. On the rear end of the engine shaft are two pinions, each one connecting up, by means of a chain, with a propeller shaft a couple of feet above the engine base and to the left and right of it. The two wooden propellers are driven in contrary directions at 400 r.p.m. for 1,000 r.p.m. of the engine.

The gasoline supply is contained in a tall vertical copper cylinder attached to one of the uprights between the two planes. Thus whatever the angle the fuel must flow, and, further, there is no loss of balance through the gasoline swinging in the tank. On the opposite side of the engine, and also attached to the uprights, is the plain, copper-tube radiator.

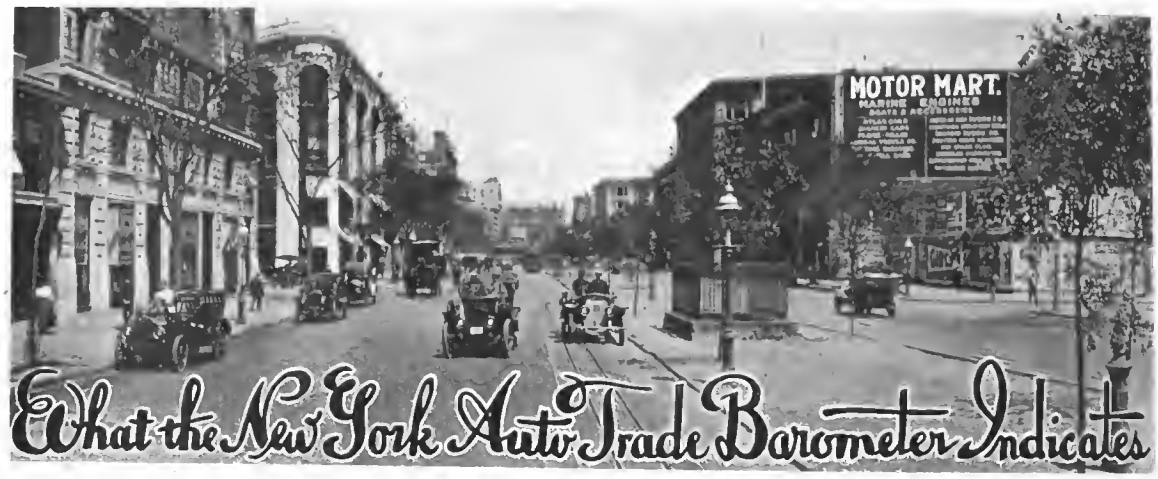
A start is made by placing the apparatus on a single wooden rail grooving into the bottom of the aeroplane. The catapult, as it has been termed, is a simple but effective method of starting, by means of which a rope is attached to the frame, carried forward round a pulley, then under and to the rear of the aeroplane to heavy weights raised and maintained some distance from the ground. On the weights being released the apparatus is violently shot along the rail, and flight occurs immediately.

At the time of starting the pilot is seated on the lower wing, looking forward, with the motor on his right hand. His feet project to rest on a cross beam, and in each hand he has a controlling lever. On the other side of the engine is the seat for a passenger, when one is carried. Control is somewhat difficult, for in addition to keeping the motor running, the pilot had to operate the forward elevation plane, the rear rudder, and the bending of the tips of the wings, one of the distinctive features of the Wright machine and one to which it owes much of its success. It will be readily understood that for one man the position is no sinecure. If a descent is made away from the starting rail it is necessary to mount the apparatus on a small carriage and wheel it back to the rail, the aeroplane not being provided with wheels, as in the case of the French machines. Aeronauts here regard this as one of the weak points, but it would be more correct to see in it an evidence of the more natural conditions under which the Americans have worked, wheels being useless except on specially prepared grounds.

LE MANS, Aug. 22.—Wilbur Wright has had to move to larger quarters, the racecourse on the outskirts of the town being too small for the flights which he intends to undertake at an early date. Eight miles from the present field is the military ground of Auvours, on the Paris road, and seven miles from Le Mans. It is here that the longer flights will be made, permission having been obtained for the use of the ground and for the erection of a shed in which to lodge the apparatus. The construction of this latter has already been commenced. On the new ground it will be possible to make a flight of three miles in a straight line, a condition of affairs which will certainly be to the advantage of the aeronaut and will allow the more accurate measurement of distances covered. The Hunaudieres racecourse is so small that the machine has to continually twist and turn.

Though the large tract of land at Auvours has been secured, it is possible that the smaller course will be maintained and that Wilbur Wright will fly across country from one to the other. The aeronaut himself has made no statement regarding this, but, according to Léon Bollée, who is in his confidence, it is being seriously considered. Two starting appliances are being erected on the Auvours ground at a distance of three miles. It is here that the two 50-kilometer flights, which have to be performed to win the $20,000 prize, will be undertaken.

Showing the Famous Aeroplane with Its Unique Starting Device Ready for Action.



What the New York Auto Trade Barometer Indicates

MORE scared than hurt comes pretty near to expressing retail trade conditions in New York during the selling season of 1908, now at an end for most dealers through the arrival of the 1909 models. New York was the storm center of the panic, and, being closest to Wall Street, was more thickly enshrouded in the atmosphere of despond that was the aftermath of the October crisis than other sections of the country. Then, again, Wall Street being near at hand is a temptation to which many New Yorkers yield, and when times are hard down there the sympathetic depression extends to no small proportion of the moneyed population. Further, "automobile row" gets many customers from those who have made lucky strikes in Wall Street. In times of money market depression and stagnation there is a cessation of buying, not only by the brokers, but also by those who dabble in stocks.

All this was against the buying of luxuries in general, and of automobiles in particular. In the face of all this, show time fears would seem to have been well founded. The outcome of the season, however, has proved the vitality and the permanency of the automobile as a sport and an industry. The results, conditions considered, have been amazing. The failures along Broadway have been insignificant in number and inconsequential in importance. Furthermore, a pretty complete canvass of "automobile row" discloses a gain in business for some, moderate profits for the majority, and an encouraging foundation for next year for all.

The panic came, happily, at a time which made it possible not only for the factories to temporarily curtail their production, but also for the dealers to trim their sails to meet any unfavorable wind that the panic aftermath might set to blowing. Consequently, makers did not try to overload their agents, and the agents put out orders for no more cars than the public could safely digest. As a result, dealers will start on their 1909 campaign with decks clearer than they have ever been at the end of any previous season.

The panic about killed retail selling at the shows, which has always been a harvest time for New York agencies and branches. Business came to a standstill and so continued during winter. With the coming of the spring, however, business began to pick up, timidly at first; but with the arrival of May it was in surprisingly active swing, and by June was at its best. July and August have brought a lot of late buying, though some of it has been of the new crop of cars of the makers who habitually make their bow in midsummer. Much of it has been by buyers, who were well able to purchase cars earlier, but prudently waited for business conditions to cross the safety line and head once more toward the prosperity zone without dispute.

Dealers are looking forward to an early fall trade. New models will more generally than ever before make their appearance in September, which, with the shows put back again to January and no longer obstructing automobile buying, would seem to insure a good fall trade. Along with other business men, automobile dealers are looking forward to a prosperity boom in 1909, and the retail trade is showing its hope and confidence by largely increased orders. Dealers argue with good reason that many men who drove 1906 and 1907 cars in 1908 through prudent economy will exchange them for 1909 cars, and they believe that this considerable contingent of buyers, added to the natural increment of the normal growth of the use of the automobile, given free rein by a return of prosperity, will bring about the biggest business year the motor car industry has ever had.

This is what New York branch managers, dealers and others have to say of the results of 1908 and the prospects of 1909:

Acme.—W. H. Flinn, of Cordner & Flinn: "I have represented the Acme since last autumn. It was not, however, until May 1 that Mr. Cordner and I established the present agency. You see, we have a few 1908 and three new cars on the floor. We think so well of the prospect from what we have already done that we have closed for 1909 for New York, New Jersey, the western half of Massachusetts and England. In fact, we have already appointed English agents and expect considerable export business."

Apperson.—Sidney B. Bowman, of the Bowman Automobile Company: "Trade was slow until May, when business began to pick up and improve. It has been well enough sustained for us to have disposed of some fifty cars. We are arranging for half as many more for next season. We are laying great store by the 1909 Apperson line. It will include a 35-40-horsepower runabout with double ignition at $3,000. We are also to have 25-30 chassis as a three-seated runabout or four-seated roadster with extension cape top at $2,450, which should be a big seller."

Autocar.—Walter C. Evans, manager of the Autocar branch: "This has been a better year than last. I am expecting the new models in September. We are expecting big results from our new Type XVIII 18-horsepower chassis, which will be listed at $2,000, including magneto and batteries. We are preparing to build town car, landaulet and victoria bodies to order for $500 up. Two wheelbases will be furnished—97 and 85 inches. Commercial wagons of all kinds will be built to order on these chassis, which have a capacity of 1,500 pounds."

Baker.—Nathaniel Platt, manager of the Baker Electric branch: "We have done fairly well considering the business depression. The victorias and roadsters have been good sellers. The first of our new runabouts is now at Newport, where it is making a hit. It has a bonnet, and is good for 30 miles an hour. Our runabouts have been showing 90 miles on one charge. We expect another of the new runabouts here in two weeks. We are already taking orders for 1909 victorias and landaulets."

Cadillac.—E. H. Brandt, manager Cadillac Motor Car Company's branch: "I have only been here since July 2, but in that time I have sold sixteen single-cylinder cars and taken orders for thirty of the new $1,400 four-cylinder machines. Our real campaign, however, will begin with our taking possession of our new building on West Fifty-ninth street on October 1. It will have an entrance on Columbus Circle. We will store and look after Cadillacs only. Mr. Leland has supplied our repair shop with the latest machinery and we have floor space for storing eighty cars, despite the fact that a 42 by 65 foot space on the main floor is given over to a showroom and the second floor to executive offices. Four-cylinder deliveries will begin in October and be at the rate of thirty per month for three months. After that we are promised all we can handle. We will go after night-hawks and independent drivers with taxicabs built on single-cylinder chassis, and you will soon see Cadillacs in that field."

Chalmers-Detroit.—Percy Owen, general manager Carl H. Page Company: "I have been a long time in the business, but I have never seen any new car arouse the public interest that has been created by the Chalmers-Detroit. We have actually had as many as 500 visitors in one day. A count one day showed fifty-eight people in the salesrooms at one time. Forty agents have already made applications for territory. Under these conditions, Mr. Page has been to Detroit and succeeded in having our allotment of cars raised to 400. Our district embraces Greater New York, Long Island, Westchester county and Northern New Jersey. We are promised twenty cars the first month, forty the second and sixty the third, which rate will thereafter be maintained. We have been taking retail orders thus early at the rate of five per day, so what will it be when the season is in full swing?"

Corbin.—H. D. Tucker, acting manager of the Corbin branch: "Mr Hutchinson has been transferred to the factory

as sales manager and I have only just taken hold here I have been connected with the branch, however, for two years and am pretty well acquainted with what has been doing here. We have sold 60 per cent. more cars than last year and have cleaned up our 1908 output. The factory, though, is putting through 100 more of Model K, which has a water-cooled motor. New York and Chicago have sold more water- than air-cooled cars. The results in San Francisco, however, have been just the reverse."

Elmore.—A. J. Robinson, of A. Elliot Ranney Company: "This has been the best season we have ever had with the Elmore We were sold out completely by April 15 Since then we have been picking up cars here and there from agents. Our sales have been around seventy-five. We are expecting the first shipment of 1909 cars the first week in September. We have already taken orders for fifteen and expect to dispose of at least 125 cars."

Fiat.—E. R. Hollander, of Fiat Automobile Company: "We have put 110 cars through the custom house and have sold ninety-six or ninety-seven of them."

Ford.—Gaston Plantiff, manager of the Ford branch: "In June our branch did the biggest business in its history. It approximated $240,000 and was for the most part made up of runabouts. We did not get our goods until late, the factory doing little until February. Since then we have had a good season. I don't think business in the aggregate has fallen off 20 per cent. I am speaking, you know, for the entire district handled from the branch. Out-of-town business has increased; in New York it has been somewhat quiet. Our territory extends to Trenton, Hartford and Albany. The new models are promised in September. I may be over-enthusiastic, but the future looks mighty good to me."

Franklin.—Winfield S. Jewell, manager of the Franklin branch: "We have done, I think, fairly well, having disposed of a little over 100 cars. We have handled more of the big and fewer of the small cars than we did in 1907. We have gotten the list price and the freight for every one of our cars and have taken no cars in exchange. Our policy in this respect has been to sell a car for a customer. We have not paid a cent of commission to a sub-agent, a chauffeur or to any salesman not on our staff. We are expecting the new cars next week. Already fifty or sixty customers have notified us that they would buy 1909 cars. Some of them have already placed orders and made deposits."

Garford.—C. R. Teaboldt, sales manager of the Garford Motor Car Company, of New York: "We have cleaned up all of our 1908 models except two. In fact, we have done much better than we expected. Our 1909 cars are at the body factory being equipped, and will be ready in ten days. We are extending our line of agents throughout the district east of the Alleghanies."

Glide and Jackson.—George J. Scott, of the George J. Scott Motor Company: "We did well with the small cars, but the big models rather held fire. In fact, the small cars sold faster than we could get them. They are all gone. We have but one Glide and two Jacksons left over. They are in use as demonstrating cars. We expect our new Glides in September and our 1909 Jacksons in October."

Haynes.—E. W. Haddington, manager of the Haynes branch: "The last of our 1908 cars were disposed of this week. The business of this branch, despite the panic, has

been better than last year. We expected, being in New York, to suffer badly from the panic, but we have done well. In 1908 trade has been the best the Haynes company ever had. The new models are promised for September 10."

Imperial.—E. S. Watson, of Watson & Treadwell: "We did not start until nearly March. We only expected this season to lay a foundation for next year. The results have been good enough to encourage us to continue. This has been a second-hand year. We believe that 1909 will be a new-car season."

Knox.—H. M. Davis, manager of the Knox branch: "Our August business has been ahead of last year. The business men who laid off horses owing to hard times are looking up motor trucks. We are securing many orders from this class. Our pleasure vehicle business has also been ahead of last year's. We are now supplying agents with 1909 models and will begin deliveries to customers the first of the month."

Locomobile.—Ray Trowbridge, superintendent of the Locomobile branch: "Business has been favorable to us. We have sold fifty-five cars more than we did last year and have cleaned up our 1908 allotment. We have always been in a position to sell any cars that our agents might not be ready to take at the time specified in their contracts."

Locomotive.—James Joyce, manager of the automobile department of the American Locomotive Company: "High-priced cars were naturally most affected by the panic, but we have done better than we expected. Our taxicab business has been splendid and the success of this department has put it up to us to produce as many cars as possible. We are surprised how good our cabs are. Reports come to us of thousands of miles without a cent for repairs. We will build more touring cars than ever next season. In fact, our factory has never been running so completely before. Every machine in it is at work."

Lozier.—C. A. Emise, sales manager Lozier Motor Company: "We have had a steady business since January 1, during which time we have sold from five to eight cars per week. Lozier registrations at Albany from January 1 to July 1 show an increase of 89 per cent. It must not be forgotten either that the prices of our cars range from $5,000 to $8,000. We had but three of our 1908 cars unsold on July 1 last. Our 1909 cars are selling at the same rate. For instance, we got rid of seven or eight cars last week. We could not have taken care of our business had it not been a panic year. We are going to prepare for next year, however, by building an addition to our factory."

Maxwell.—Col. K. C. Pardee, of Maxwell-Briscoe, Inc.: "We are ahead of last year in this branch, despite the panic. We have entirely cleaned up our 1908 allotment. Up to July the factory had turned out 3,000 more cars than last year, and we, of course, got our share of the increase."

Mitchell.—C. P. Skinner, of the Mitchell Motor Car Company of New York: "Business has been a hundred per cent. better than last year. We have sold eighty-eight cars. This was all we could get from the factory. We are looking for 300 cars next year. We are expecting our new models in September. We will be prepared to meet the new price competition with a 30-horsepower four-cylinder car ,with magneto and selective transmission, which we will sell at $1,500. The Albany registration shows a gain for the Mitchell of 127 per cent., the figures from January 1 to July 1 showing 193, to 85 for the same period in 1908."

Moon.—Charles A. Duerr, president Moon Motor Car Com-

pany of New York: "This company took the Moon agency on July 1 and since then has sold seven cars, all of them 1909 models. We are figuring on 100 the coming season and are promised shipments at the rate of ten per month."

Mora.—W. W. Burke, manager Mora Motor Car Company's branch: "I did not take charge of the branch until February 1 and the new factory was not completed until May, so I had no right to hope to do much more than establish the Mora in New York in a good position for trade another year. We have done what I should call a fair business, though we have sold more cars than were ever put out in the metropolitan district before. Our line for 1909 will embrace a 24 at $1,850, and a 60 at $2,750; both fours. We will also continue our six."

National and Rambler.—Fred E. Lee, sales manager Homan & Schultz Company: "We have so far done about 75 per cent. of the business of last season. This applies equally to Ramblers and to Nationals. It looks, however, like a late season. In the first place, those who thought themselves poor are now realizing that they are not. Then again, the shows do not take place until late and we are not talking of 1909 cars, which we will not get until the shows."

Oldsmobile.—Gen. John T. Cutting, of the Oldsmobile Company of New York: "We have done a much larger business than we had any right to expect under present financial conditions, and in view of the fact that we were delayed in receiving cars at the beginning of the season, owing to our factory having curtailed production during the panic months. Despite all this, we have sold three-quarters as many cars as we did in 1907, but that year we took more than we placed ordered."

Packard.—M. J. Budlong, manager of the Packard branch: "Our business in this season was way ahead of last year. It kept up prosperous at the factory, which turned out 300 more cars than it did in 1907 and will increase the output by several hundred in 1909."

Peerless.—John A. Clark, of the Peerless Motor Car Company of New York: "We sold the last of our 1908 allotment three months ago and since then have sold all the cars we could buy from other agents. We have doubled our order for 1909 cars. Customers are offering premiums for delivery before October 1. Our business this year was fully 50 per cent. above expectations."

Pierce.—R. W. Slusser, of Harrolds Motor Car Company: "Our manager, Mr. Garden, is away on his vacation, but I can tell you that we have sold all the cars the factory would let us have. The demand for the new cars, which will be out in October, is enormous. We are booking orders for them from photographs and blue prints. We think that as far as big orders are concerned 1909 will be a repetition of 1906."

Pope and Matheson.—A. G. Southworth, of A. G. Southworth & Company: "We have done exceptionally well under the circumstances We ordered and disposed of the same number of Pope-Hartfords as last year, but you must remember that in former years we went beyond our allotment and got cars from other agents. More Mathesons have been sold in New York than ever before, but the former agent had a stock in hand, cut the prices and sold two to our one."

Pullman.—F. Cimiotti, of Cimiotti Bros.: "Our success dinner given early in the summer in celebration of our having disposed of an entire allotment of Pullmans, I think, will answer any question as to this season's business, and the fact that we have doubled our order for 1909 any query as to what we think of the prospects of the year to come."

P. & S. and Simplex.—C. A. Singer, of Palmer & Singer Mfg. Co.: "We did not begin to receive our P. & S. cars from our Milwaukee factory until June 15, so we are practically beginning the 1909 season. The factory has been turning out from seven to ten per week and we have had customers all the time awaiting their arrival."

Rainier.—Paul Lineberger, sales manager of the Rainier Motor Car Company: "We started to make 300 cars, but owing to the panic cut it down to 180. We have but three of these left. Seventy-five per cent. of the cars were sold in New York and the balance by our agencies in Pittsburg, Los Angeles and Chicago. We are planning to build 250 cars."

Renault.—Paul Lacroix, manager American branch of Renault Frères: "The panic did not affect us. In fact, we did better than last year, when we sold 214 cars. We are already over that number, with several months of selling yet to come. I am expecting shortly a new 20-30-horsepower Renault built especially for American roads. It has ten inches' clearance and is lighter and shorter than the standard chassis. It has a 120-inch wheelbase and will sell, complete with runabout body, at $6,000. Next year I will import a 10-horsepower runabout with 3x4 ¾-inch cylinders, to sell at $1,500."

Reo and Premier.—R. M. Owen, of R. M. Owen & Company: "Our local business is a mere detail of our general selling. We have, though, done better in New York than last year. Our business in the country at large has not varied considerably from that of last year. We have been unable to get all the Premiers we wanted."

Stearns.—William Wurster, of Wyckoff, Church & Partridge: "Including cars sold by our branches in Boston, Brooklyn, Philadelphia and Baltimore, we have disposed of 160 machines. Registrations of Stearns cars in this State from January 1 to July 1 were ninety-four, as against forty-six in 1907, an increase of 104 per cent. These sales were practically all local. Our order for next year will be raised to 275 cars. Our contract is $3,000,000 of Stearns cars in three years."

Stevens-Duryea.—Frank Eveland, manager of A. G. Spalding & Bros.: "We were without four-cylinder cars from October till June. During that time, though, we delivered 25 per cent. more six-cylinders than the year before. Since July 1 we have had the largest business in our history for July and August in selling and delivering of cars. We have had since July 1 many sales right off the floor, and now are making prompt deliveries of our four-cylinder cars."

Stoddard-Dayton.—R. S. Newton, of the Atlantic Motor Car Company: "Up to the panic in October, the 1908 cars, which began to come through in August, sold exceedingly well. Everything then fell off till Christmas and then grew gradually better. We sold forty-three cars in May, which was the best month for our business. Our trade as a whole has averaged up to last year's, despite the panic let-up."

Studebaker.—C. F. Reddin, manager of Studebaker Automobile Company branch: "We have doubled our sales of 1908 cars over the 1907 models. We are anticipating big business with our 1909 line, which is to include an autobuggy."

Thomas.—Harry S. Houpt, of the Harry S. Houpt Company: "Our business has been highly satisfactory, considering the panic. We are now doing a better business than we did at the corresponding season last year."

Waltham.—A. G. Bechtel, assistant sales manager of the Waltham branch: "Our selling season does not end until January, when the new cars will be brought out at the show, so you see we have four selling months ahead of us. We have closed out all our big cars and have only 50 of the single-cylinder buckboards left to be sold. Our two-cylinder buckboards have made such a hit that we have but six of them left."

White.—G. W. Bennett, district manager of the White Company: "In our territory we have sold within three cars of double what we did last year. In New York there has been a big improvement over last season. We have but six unsold cars in all our branches, so you see how well stock has been cleaned up in this district. During the entire panic I did not lay off a single salesman. In my opinion, 1909 will be the biggest year in the history of the trade."

Winton.—Charles M. Brown, manager of the Winton branch: "I have only been here, you know, since July 4. However, I have been looking in the books and can tell you that we have done more business in dollars and cents and sold more new and second-hand cars than in 1907. It must not be forgotten, either, that we have been up against a raise in prices from $2,500 to $3,500 and $4,500. We have not only cleaned up on our allotment, but also drawn on other branches."

WHAT IS THE BEST RELATION OF BORE TO STROKE?*

By Gerard Lavergne.

BEFORE directly taking up this subject, which is one of considerable interest to designers and car owners alike, at the present moment, it will be well to go briefly into the subject of the power of the motor as a necessary preliminary, in order to show the importance of the stroke as a factor. To do this, we will take the formula of M. Witz, which is as follows:

$$P = 4 K p \frac{\pi D^2 L \omega}{4 \times 60 \times 75}$$

In which P represents the maximum output of the motor in horsepower, the formulæ and tables of the present article dealing with four-cylinder motors; K, the mechanical efficiency of the motor, which it is prudent not to estimate as being above 75 per cent.; p, the mean effective pressure per square centimeter of the explosive gases, expressed in kilogrammes, and D and L, the bore of the cylinders and the stroke of the pistons in millimeters, ω, the angular velocity of the motor in r.p.m. But as the application of this formula would be found very difficult in practice, we have eliminated the mean effective pressure, p, the angular velocity and the stroke L.

The impossibility of conveniently determining the mean pressure causes us to drop it, though possibly by doing so we have neglected one of the elements whose influence would be the most interesting that could be shown. However, with equal compression and a similar method of ignition, and there is scarcely anything more standard than ignition by magneto, whether high or low tension, the m.e.p. of one motor is practically on an equality with that of another. We have based our elimination of the angular velocity and the stroke on the fact that they do not enter into the formula, except by their product, ωL, and that, at an equal piston speed, when the stroke L is increased, the angular velocity decreases in such a manner that the product ωL remains nearly constant. In fact, we have adopted the formulæ, $P = 0.0028\ D^3$, adopted by the *Commission Technique de l'Automobile Club de France*, and $P = 0.0025\ D^3$, recommended by M. Arnoux. Since that time numerous other formulæ have been proposed. The relation of the parabolic form is the following: $P = K D^m$, which, put in logarithmic form, becomes $\log D = \frac{1}{m}(\log P - \log K)$, which may be represented graphically by a straight line, of which the angular coefficient is 1/m, and of which the point of contact with the axis of the abscissæ furnishes, on the logarithmic scale, the value of K.

Carrying on the abscissæ and the ordinates, respectively, the values of the decimal logarithms of the powers and bores (the logarithmic scales, written the length of the two axes of the coordinates, permitting the direct reading of the values of the powers and bores corresponding to any point on the diagram), it will be found that the relative points of 105 four-cylinder motors are almost all comprised within two lines corresponding to the parabolas having for their equations respectively:

$$P = 0.044\ D^{2.1}$$
$$P = 0.167\ D^{2.82}$$

Owing to its clearness, this diagram may be utilized to advantage for the study of the comparison of the experimental results relative to different types of motors.

Unfortunately all formulæ of the type $P = K D^m$, not taking into account anything but the bore, and in which, in every case, the influence of the elements, K, p, ωL, is not present except in a numerical coefficient, is not exact. It will suffice to make this clear, to recall that we have taken, in order to eliminate the elements ω and L from the Witz formula, the constance of the product ωL, which is itself based on the constance of the linear speed of the piston. If we now refer to the table given by M. Arnoux in his article *The Predetermination of the Maximum Power of Explosive Motors* (published in The Automobile of January 24, 1907), we can extract Table I, which we have completed by the addition of the piston speeds and relation of the bore to the stroke. We can see from this that the piston speeds vary from 3.62 meters to 8 meters per minute, and that it increases with the bore and power of the motor. While this factor varies in the ratio of 1 to 2.2, the r.p.m. rate (if in M. Arnoux's table the single exception with a speed of 950 r.p.m. be omitted) only has a range of from 1,100 to 1,650, or a ratio of 1 to 1.5.

The product ωL, under such conditions, would have, in the case of motor No. 1 of the table, the value $3.62 \times 1,450 = 5,249$, and in the case of motor No. 26, $8 \times 1,200 = 9,600$. Its constance may be judged from this, and at the same time the importance of taking the stroke into consideration when calculating the horsepower of a motor may be realized. This is so well understood that many authors have proposed formulæ in which they have neglected the influence of the angular velocity, while giving particular importance to the stroke L. In 1904, M. Favron proposed the formula, $P = 0.007\ D^m\ L^n$, in which it is necessary to have $m = 2.1$ to 2.15, and $n = 0.6$ to 0.8, according to the results of experiments with a series of Aster motors, having bores ranging from 80 to 140 mm. Later, and in order to avoid the employment of logarithms, he proposed the substitution for the preceding formula of the following: $P = 0.007 D^2 L^{0.5}$. But as both the application and the accuracy of the last are not as great as those of the first formulæ, he developed in 1907 a short rule of calculation which permits of directly reading the results of the better formula. M. Faroux successively proposed $P = 0.00002956\ D^2\ L^{0.6}$ and $P = 0.00002956\ D^{2.3}\ L^{0.7}$. However that may be, the influence of the stroke has been sufficiently demonstrated, and it is the purpose of this article to study the latter.

TABLE I.

Data Concerning a Number of Four-cylinder Motors.

Brake H.P.	R.P.M.	Piston Speed Metres per Sec.	Bore, mm.	Stroke, mm.	Bore to Stroke.
10	1,450	3.62	55	75	1.15
12.5	1,600	3.66	65	70	1.07
20	1,400	5.50	90	120	1.33
18	950	4.11	90	130	1.44
22.5	1,500	5.00	90	100	1.11
24	1,500	5.05	90	95	1.05
33.5	1,350	5.35	104	130	1.25
31.3	1,250	5.00	104	120	1.15
27.7	1,550	5.58	104	110	1.05
25.4	1,500	6.00	104	120	1.15
43	1,250	5.33	120	140	1.15
40.5	1,150	5.55	120	145	1.20
47	1,300	5.53	120	130	1.08
52	1,350	5.49	120	122	1.01
67	1,300	6.28	140	145	1.03
70	1,380	6.44	140	140	1.00
60	1,150	5.13	140	150	1.14
63.5	1,260	6.30	140	150	1.07
75	1,400	6.44	140	138	0.98
82	1,250	6.56	155	150	1.03
93	1,400	7.00	155	150	0.96

101.5	1,350	6.20	160	140	0.87
90	1,250	7.08	160	170	1.06
80	1,200	7.20	160	180	1.12
105	1,350	7.11	150	158	0.98

Comparative Data of a Number of Motors.

Theoretical Inconveniences of a Long Stroke.

We will begin by taking up the disadvantages of a long stroke, the following of which are irrefutable:

1.—The long stroke necessarily increases the space occupied by the motor, which is naturally not an inconvenience in the case of the stationary motor, on which it is universally regarded as advantageous. It is likewise for the automobile motor, but the latter is always mounted vertically on the forward part of the car (the horizontal motor unjustly proscribed by fashion would avoid this objection). In fact, it has been calcu-

*Translated from *Omnia*, Paris, by Charles B. Hayward.

lated that a four-cylinder motor of 155 mm. bore, such as those which lined up in the recent Grand Prix race, would, if given a stroke of 240 mm., probably a great advantage in both power and efficiency, have resulted in a car with a bonnet about 1.60 metres above ground, an excess of elevation of the center of gravity which would have evil consequences on its stability.*

2.—The increased length of the stroke and that of the crank (equal to one-half that of the former), if transformed, with the same connecting rod, into an increase in the latter's angularity, with the consequent necessity for a greater offset.

3.—It increases the weight of the motor, and as a result diminishes its power per pound.

The *Commission Technique de l'Automobile Club de France*, in the preparation of the program for its races for motors of high power for weight, made a special investigation of the motors of a number of builders. The results were published in the form of a table and a diagram. From the former we have extracted our Table II, in which the sixth column gives the weight of the motor, including that of the carbureter, ignition system complete, starting crank, water pipes, radiator with water reservoir, grease cups, etc., but without the weight of the inlet manifold, exhaust piping, water, gasoline, oil or grease. The motors are classified in the order of their descending power for weight (*puissance massique*). We there see that among the first five there are three comparatively short motors and two "square"; then there are several long motors, and the eleventh is really short. However, after a general fashion the table clearly proves that the weight per horsepower increases with an increase in the stroke, and experience verifies this deduction.

TABLE II.

Weights of Motors per Horse-power from Data Supplied by Makers.

Bore, mm.	Stroke, mm.	Bore to Stroke.	R.P.M.	HP.	Wt. Kilos.	Wt. per HP.
170	150	0.88	1,300	102	370	3.62
150	150	1.00	1,000	80	300	3.75
180	170	0.94	1,100	127	480	3.78
160	98	0.61	1,300	95	395	4.15
160	160	1.00	1,100	90	380	4.22
155	175	1.12	1,100	100	450	4.50
145	160	1.10	1,360	84	412	4.90
102	116	1.13	1,460	37	233	6.29
120	140	1.16	1,200	44	300	6.81
120	140	1.16	1,200	60	420	7.00
150	138	0.92	1,200	70	497	7.01
110	130	1.18	1,500	43	311	7.24
112	130	1.16	1,200	38	368	9.68
110	120	1.09	1,100	35	350	10.00
110	130	1.18	1,300	35	353	10.08

Weight per Horsepower Compared with Other Factors.

On the other hand, it is not necessary to exaggerate the importance of inconveniences attendant upon a long stroke. As we have already mentioned, the weight of a motor from which its weight per horsepower is calculated does not comprise the weight of its supplies, and particularly that of gasoline. But long-distance touring cars must carry a tank sufficiently large to make frequent replenishment unnecessary. As an offset to this, as we will show later on, the short motor does not utilize so effectively the results of expansion as does the long motor, and should consume more than the latter. If, then, it is desired that with the short motor the necessity of refilling the tank should occur at the same intervals as with the long motor, it will be necessary to increase its volume and weight. But, everything considered, the weight per horsepower of the motor-tank group should be about as great with one as with the other.

4.—In lengthening the cylinder and, in consequence, increasing the piston speed, the duration of the various phases of the cycle, and particularly that of combustion and expansion, the long motor increases the length of the cooling jacket, with the consequent heat losses that this entails, so that the calories contained in the combustible are not as effectively utilized.

For a long time past M. A. Witz has called attention to the striking influence of the walls of the cylinder on the efficiency. Following experiments made with a motor, in which the piston speed under the action of the explosive mixture could be increased or moderated at will, he demonstrated that the cooling of the gas in contact with a wall more or less hot, modified the order of combustion and expansion. By reducing to the greatest extent possible this cooling action, the efficiency of the motor is increased; the calories drawn from the combustion cycle by the cold water and wasted in the air are diminished. It is expedient, then, to have the motor function with the cylinder walls as warm as possible in order to effect the combustion and expansion in the minimum period, which cannot be done with the long stroke, assuming the same piston speed.

But since the question here is one of time, by increasing the speed of the piston (and this is what justifies the notable variations appearing in Table I), this disadvantage of the long stroke disappears, and, it must be added, this is the only one that presents itself from the point of view of theoretical heat efficiency. This naturally leads us to a study of its advantages.

Theoretical Advantages of a Long Stroke.

1.—By increasing the duration of the various phases of the cycle, with an equal piston speed, the gaseous mixture becomes more intimate in the carbureter, in the manifold, and in the cylinder, where it remains a longer period (it is true in greater mass, as the cylinder is larger); the ignition and combustion take place under better conditions; finally, and above all, the expansion is more integral, the calories utilized more numerous, and those rejected to the atmosphere with the exhaust gases of less importance. The exhaust is more effectively accomplished, and the combustion chamber emptied to a greater extent, thus permitting of a larger charge of fresh gas being aspirated in the same period of time.

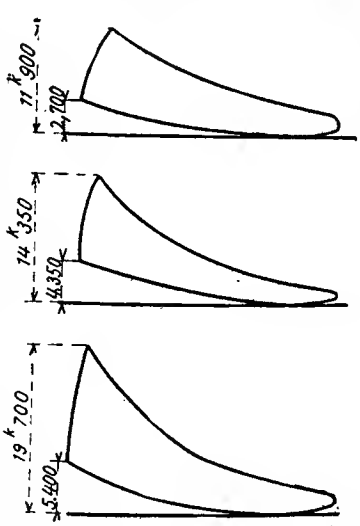

Fig. 1.—Effect of Increasing Compression.

2.—From the viewpoint of mechanical efficiency, the long stroke is also an advantage. The resistance offered by the moving parts of the mechanism should, in fact, be calculated with reference to the maximum stresses they are called upon to endure in the form of pressure exerted on the head of the piston by the explosion. On the other hand, it is not the maximum pressure so much as the mean effective pressure that determines the power, and it may be said that the mechanism is being utilized to a greater degree when the maximum and mean pressures are close to one another. In the majority of motors their relation is equal to 15; it is too great, and in diminishing the surface of the piston and increasing its stroke this is diminished also, making a much smoother running motor.

3.—With an equal density of mixture, the same volume of the combustion chamber in which the compression takes place, the latter is, for a given bore, proportional to the stroke of the piston. The advantages of high compression are well known:

(a.) It raises the temperature of the mixture before ignition, rendering the latter more prompt and integral, and with it the more complete combustion and utilization of the fuel.

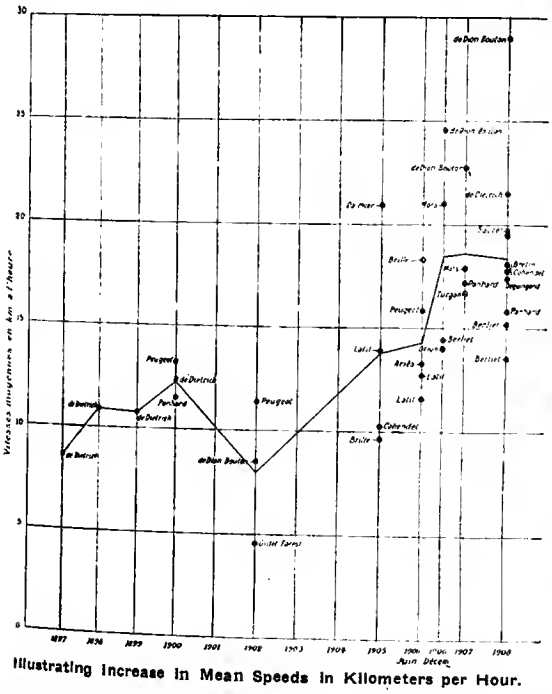
(b.) Compare the diagrams of Fig. 1, taken on the same motor, with the same combustible mixture and operating with a constantly increasing compression: 2.70 kilogrammes; 4.25 kilogrammes, and 5.40 kilogrammes per square centimetre. The line of the card showing the explosion is heightened and lengthened as the compression increases. The pressure at the end

*Experience has shown that for racing cars, the connecting rod should be four times as long as the crank; an increase of hut 20 mm. in the stroke is attended by an increased height of the motor of 100 mm.

of the stroke has the respective values of 11.90, 14.35 and 19.70 kilogrammes, and the mean pressure 5.04, 6.0, and 6.94 kilogrammes. The area of the diagrams, representing a measure of the indicated power, follows an analogous progression. It is the same with the indicated efficiency, since the mixture introduced only varies in volume, and not in nature, and with the same expense of fuel a greater amount of work is obtained.

(c) The increase in the compression decreases, as we have already said, the duration of the explosion, permits of giving the piston a greater linear speed, and shortens the duration of the cooling effect, combining the advantages of slight cooling and long expansion, and overcoming in this manner the sole objection which we have made on the latter score, from the point of view of thermal efficiency.

But what degree of compression should be adopted? M. Marchis has estimated that 2.5 to 5 kilogrammes per square centimeter, which represents present practice, could readily be increased to 6 to 7 kilogrammes without modifying to any extent the essentials of the motor. The latter figure may be slightly exaggerated, and, in fact, high compression becomes useless when it can only be employed by an excessive dilution of the mixture to avoid auto-ignition. Customarily 13.5 parts of air are mixed with one of gasoline, and it seems that the proportion could be carried to 15 to 1 with advantage, and then the compression could be raised to 6 kilogrammes without any fear of auto-ignition. However, as a high compression renders the recovery of the motor more difficult, it will be more prudent to adopt as a standard for the touring car a compression of 5 kilogrammes per square centimeter.



Illustrating Increase in Mean Speeds in Kilometers per Hour.

4—For a given piston speed the long motor will wear less than the short one, for the very good reason that there are fewer reversals of the movement of the piston and connecting rod—reversals that are always sudden and which tend to disrupt the mechanism. The long stroke and the smaller number of turns also diminish the friction, and should increase the efficiency.

5—A motor having a high angular velocity is more difficult to regulate than a motor with a less number of r.p.m. The reasoning *a priori* can clearly be concluded in favor of the long motor.

What is the teaching of experience on the subject? A short motor, having a bore of 152 mm. and a stroke of 110 mm., with a piston speed of 7.33 metres per second, turning over at about 2,000 r.p.m., develops 100 horsepower. In one minute it aspires 1,000 cylinderfuls, or 8,000 litres, of carbureted mixture, equivalent to 80 litres per horsepower minute. A long motor, having a bore of 130 mm. and a stroke of 150 mm., with a piston speed of 6 metres per second, turning over at about 1,200 r.p.m., aspires 600 cylinderfuls per minute and develops 70 horsepower. The consumption per horsepower minute is but 68 litres.

M. Faroux reports that a well-known manufacturer of light cars, wishing to decide upon a single-cylinder type of 100 mm. bore, constructed several varying types and submitted them to severe comparative trials. A stroke of 140 mm. gave 14 horsepower, which was considerably better than dimensions of 100 by 120 produced. By further increasing the stroke to 150 mm. the power increased to 15.5, and finally a stroke of 170 mm. produced 18 horsepower, with a slightly decreased consumption per horsepower hour than was the case with the 100 by 140 motor, which gave but 14 horsepower. Accordingly, experience may be said to substantiate the theoretical deductions. We will show later the results obtained by recent Grand Prix cars.

ROLLER BEARING AXLES FOR HEAVY TRUCKS

Among the products that are being brought out for the season of 1909 by the Timken Roller Bearing Axle Company, Canton, O., for business wagon makers is a line of heavy roller-bearing axles specially designed for heavy commercial work. As in the lighter models turned out by the same company, the object has been to provide an axle in which friction has been reduced to a negligible quantity; in other words, one that will have the greatest carrying capacity per unit of bearing, and one that will withstand both radial load and end thrust without the use of extra bearings to take care of the latter. This new axle, which is illustrated by the accompanying cuts, is of the I beam type of 2 1-2 by 4-inch section, and is equipped with Timken roller-bearings in the steering heads, universal steering joint connections and large knuckles of the Elliott type, hardened and ground steel bushings, grease cups and other necessary fittings. It is designed to carry a load, including the truck, of 18,000 pounds. The top view of this new axle shows the great range of centers for seating springs that is provided, the pads being forged integral with the axle, while the seats can be located where desired. The attention now being paid to special parts for the commercial vehicle affords excellent evidence of the increasing demand for cars of this type and for all classes of service up to the heaviest, in which the parts must be unusually strong.

Heavy Type Timken Axle for Large Trucks.

LETTERS INTERESTING AND INSTRUCTIVE

FOCUS OF ACETYLENE HEADLIGHTS.

Editor THE AUTOMOBILE:

[1,516.]—I have been much annoyed lately by a very mysterious trouble affecting one of the acetylene headlights on my car, and there is nothing that I can think of that even suggests a method of remedying the difficulty. If your knowledge will help me out, I certainly will greatly appreciate having the benefit of it. The derangement is confined to one lamp, of the two that are fed from a single generator, and causes the light from this lamp to slant upward, so that it does not strike the road at all, except in coming from a level onto a hill. The result is that the lamp, though it gives a good light, throws this light in such a direction as to make it practically useless for driving. I thought at first that the reflector, which is of the usual glass kind, might have become tilted or displaced, but there are no signs of this, the lamp being of very substantial construction, with heavy brass parts holding the reflector securely in place. Is it possible that the reflector could be in any way warped from the heat of the flame?

Birmingham, Ala. JOHN W. FEENEY.

The difficulty appears to be due to the position of the flame, which must be slightly below instead of directly in the focus of the lens mirror, where it should be. A fore or aft displacement away from the focus would have the effect of spreading the beam, but from your letter we infer that the beam is fairly concentrated, only projected in the wrong direction, showing a displacement of the flame in a plane at right angles to the axis of the mirror. A possible cause of the displacement may be in the recent replacement of the burner tip with one that starts too low for the lamp. But a more likely cause—one that often gives the symptoms you describe—is a weak flame, due to the clogging of the burner openings. In such a case the center of luminosity of the flame will be materially lower than the normal, with the result that the light rays strike the lens at such an angle as to be reflected too high. The remedy is cleaning the burner with a fine wire, or better still, to replace it with a new one.

QUERIES ON TWO POINTS OF INTEREST.

Editor THE AUTOMOBILE:

[1,517.]—I should like some enlightenment on the following two subjects: (1) Why will spark plugs miss fire with a gap of 1-64 inch, and fire regularly with a gap of 1-32 inch?

(2) I have been awaiting information asked some time ago by a correspondent owning an Autocar, regarding the so-called "puddle" carhureter (probably the 1908 Holley). What can the Ford runabout owners say about them? SPARK GAP.

Somerville, Mass.

Do you mean why does the spark plug miss fire, or why does the cylinder in which it is located fail to fire its charge when the spark plug in it has the smaller gap? In the latter case, we should say it was a case of the mixture and not of the spark plug alone. In other words, the spark caused by the current bridging the smaller gap is not sufficient to fire the mixture in the cylinder, whereas the 1-32-inch spark is. It must also be borne in mind, that the spark which actually takes place in the cylinder is nothing like as large as that which is seen when the current is caused to bridge the gap of the plug in the open air. This is because of the greater resistance of the mixture in the cylinder, due to the increased compression. The spark which occurs when the points are only 1-64 inch apart, may appear strong and sufficient in the open air, but it is much weaker when subjected to the compression in the cylinder, and is probably reduced to a point where it does not raise the temperature of the gases immediately surrounding it to a point where they will ignite with the small spark caused by the gap in question. It is not that the current fails to create a spark at the gap, but the spark thus made is insufficient.

We again call the attention of our subscribers to your second query and trust that some of them will come forward in the near future with the desired information.

FORMULA OF THE ALGONQUIN HILL CLIMB.

Editor THE AUTOMOBILE:

[1,518.]—Will you kindly enlighten me in your "Letters Interesting and Instructive" how the efficiency of an engine may be arrived at by using the Chicago Motor Club's formula, which they employed at the hill-climb at Algonquin, August 15? I believe they multiply the cylinder displacement by the time made on two hills, and divide the result by the weight of the car, including the driver.

New York City. S. E. T.

Your information concerning the formula is correct, with the exception of the first item, which should be the piston area, instead of the cylinder displacement. Assuming the same mean effective pressure, the power of the engine increases as the square of the diameter of the bore, in other words, the piston area, so that this has been taken as the factor representing the power of the motor. Hence, we have in the formula in question, the product of *power* by *time*, divided by *weight moved* through a given distance, the result of which is the measure of efficiency of the car. Of course, it can only be approximate owing to the important factor of power being a variable that may differ very greatly. Nor does it take into account the personal equation in the shape of the driver, as skilful handling may make several seconds difference in the time required to ascend the hill, but this of course is something that could not be equalized by any method of calculation, so that taken all in all, the formula may be said to work out equally well, in favor of all the competing cars, particularly as the latter are classified according to size and power as a preliminary.

MOTOR MISSES WHEN RUN LIGHT.

Editor THE AUTOMOBILE:

[1,519.]—Will you please answer through "Letters Interesting and Instructive" the following questions: I have an opposed 5 by 5 automobile motor, water-cooled, which pulls good under a load, but going down hill it will miss half of the explosions. Also misses when running idle, but give it the throttle and it fires all right. What is the cause of this?

What is the cause of the outer casings cracking at the clincher? Same are 32 by 4, and have only run 723 miles. Car weight is 2,000 pounds. They have never been punctured. R. H. DOE.

Adrian, Minn.

It seems quite evident that it is not getting sufficient gasoline when running light to enable it fire regularly. Either open the gasoline needle valve slightly or correct the air adjustment so that it does not get too much air when not under load. The reason that it fires regularly when running loaded is due to the greatly increased suction exerted by the pistons and, as a consequence, the increased amount of fuel that is drawn through the nozzle. We do not know exactly what to ascribe this failure of the tire to, without more information, or, in fact, a view of one of the casings. Speaking generally, however, it may be due to having run the tire without being properly inflated, and may actually be a form of rim cutting. Or it is possible that it may be a defect in that particular casing.

WHAT IS MEANT BY A HORSEPOWER?

Editor THE AUTOMOBILE:

[1,520.]—If it is not too much trouble, will you please tell me what a horsepower is? Also how far it is by road from Mahanoy City, Pa., to Chicago, Ill.? I was referred to you by the editor of "Popular Mechanics." ANDREW DEMEETER.

Shenandoah, Pa.

Horsepower is a rate of performing work, the foot-pound being the unit of work. James Watts figured that a horse was capable of lifting 33,000 pounds one foot per minute, or in other words, of performing 33,000 foot-pounds of useful work per minute, and he established this as a standard which has since been universally followed.

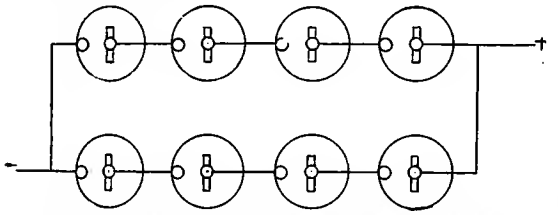
The distance from Mahanoy City, Pa., to Chicago, Ill., depends very largely upon which way you would go, as it is

possible either to start northward toward Elmira or southward toward Harrisburg or Altoona, in each case connecting with a trunk line highway to Chicago. An average would put the distance between 800 and 900 miles.

OLD NEWSPAPERS AS AN AID TO TOURING.

Editor THE AUTOMOBILE:

[1,521.]—I have found it a good plan to always carry several newspapers in the car when touring. If the rear wheels start to spin round in a muddy spot, a couple of newspapers spread over the mud will often enable the rear wheels to climb out, thus avoiding the necessity of putting on the chains in an unpleasant place. Newspapers will also be found handy when any adjustments have to be made under the car.



Series-Multiple Wiring of Dry Cells Increases Mileage.

I have been able to obtain much greater mileage from four dry cells than from six dry cells, wired in series. When six cells are used, a much greater current is forced through the coils, which rapidly exhausts the batteries and also causes pitting and burning of the platinum contact points. If one wishes to use more cells it is better to connect them in series-parallel, i.e., two groups of four cells, connected in multiple, as shown by the accompanying sketch. When connected in this manner, they last quite a while.

Allegheny, Pa. MURRAY FAHNESTOCK.

The use of newspapers for the purpose of protecting one's clothing and of saving as much of one's temper as possible, when it is compulsory to stay for any length of time underneath the car is such a simple expedient that it can well be recommended to those who tour. Even where there does not happen to be any mud present, it saves the necessity of having to brush a goodly coating of road dirt from one's clothes, and doubtless even an experienced chemist would be surprised to find the number of undesirable constituents to be found in road dirt.

This form of connecting up dry cells has long been recommended by builders of cars, and the manufacturers of dry cells themselves, and we have also always taken pains to point it out to those who complain of poor service from dry cells. Connecting them in series multiple in this manner, as shown by your sketch, is merely providing a factor of safety which prevents the cells from being overworked constantly, and which also permits them to deliver their output at a rate better suited to their capacity, and in this way their active life is greatly prolonged.

TO PREVENT GRADE CROSSING ACCIDENTS.

Editor THE AUTOMOBILE:

[1,522.]—I notice that in spite of the great number of recent accidents at unguarded grade crossings and the resulting, yet resultless, talk that has followed, these accidents still continue. I would like to propose a new scheme, which, though cheap in itself, would not allow this wholesale loss of life to continue. By placing this in your "Lettere Interesting and Instructive," I believe that it will receive due attention from all those interested. Leaving at the railroad tracks the present T sign, "Look out for the cars," I propose that on each side of the crossing, at from a half to a quarter mile out from the railroad tracks, a similar, or some conspicuous warning, sign be placed so that automobiles going in either direction will notice it. Then, at no matter what rate the machine is going, the driver, seeing the sign, will have sufficient time to slow down and have the machine under perfect control when the sign by the tracks comes into view. Then one of the party could get out, cross the tracks, and signal the driver to come ahead or not, just as the conductors on the trolleys do.

Under present conditions, where they try to remedy the danger at a place where the road makes a sudden bend and hides the crossing till just upon it, by placing a flagman there—even if they put gates there—the driver will have no more of a chance to escape the danger than if no man was there. In the nighttime a red light or some illuminating scheme to light up the sign could be placed on the first post. For a few cents a week some resident nearby would willingly attend to the lamps. Then another lamp on the post by the tracks will show the motorist where the tracks are. In this way, be it night or day, be no longer drives along ignorant of danger ahead.

If the automobile clubs would get together, they could easily make railroads, the county or townships—whichever is responsible—place these signs on the roads. Why not let the clubs start in immediately themselves and set the example? It certainly would be much cheaper than putting men at the crossings and installing gates; the cost would be comparatively nothing. Surely human life is worth that much. For those reckless and heedless drivers who have more than harmed the reputation of the motoring public, should they continue their reckless pace and ignore such warnings and signals as they do the law, then let them dash on to that dreadful, inevitable, yet deserving fate. AUSTIN M. WOLF.

New York City.

REDUCING THE DANGERS OF TRACK RACING.

Editor THE AUTOMOBILE:

[1,523.]—As it is reported that more automobile races are to be held on the present horse tracks, it may be that a suggestion as to a method which, in the writer's opinion, would greatly reduce the danger attending such races, will be of interest. If track racing accidents are investigated it will be found that in most cases the trouble was caused by the vehicle, after leaving the track at a turn, dashing into either spectators, fences or trees or running over banks, and that had the driver sufficient cleared ground outside the track to have brought his vehicle under control after leaving it and before the obstruction or danger point was reached no disastrous results would have followed. It will also be found that even those few accidents due to collisions or breakage of parts might have, in a large measure, been prevented from having serious results if the driver had a place outside of the track which he could have run on to in an emergency. It is believed that the danger of reasonably restricted automobile races upon horse tracks could be reduced by means of the suggested cleared ground to such an extent that it would not be greater than that on a specially constructed track where races were held without restrictions.

The cleared ground should always extend around turns beyond the commencement of the straight parts at both inside and outside of the track. It need not be exactly level (if banked so much the better), and should be left soft in order to check a vehicle running on to it quickly as possible. There should not be any gutters that might upset a machine between this cleared ground and the track and all spectators should be kept off of it. This latter, it is thought, would be comparatively easy, as the principal reason why spectators persist in getting close to the track at present is the fact that the fences, usually near its edge, not only obstruct the view of anyone some distance back from them, but also form a very advantageous support to sit or lean on. If fences are necessary, they should be as far as possible from the track at the curves, so as to both be out of the way of any automobile that leaves the track and to render it unnecessary to attempt to drive the spectators back from them.

In closing, the writer would say that he would like to hear of other methods of reducing the danger of track racing, as by a discussion of the subject it may be possible to reach some inexpensive plan which will make it at least as safe as other sports and which will enable the holding of race meets, and particularly 24-hour races, without fear that they will be marred by serious accidents. A. E. OSBORNE.

New York City.

JERSEY SEASHORE TRAPS WORKING FULL BLAST.

Editor THE AUTOMOBILE:

[1,524.]—Would you please inform all your readers that intend coming to Asbury Park and other points on the Jersey coast to drive with care, as there are police traps from Red Bank, N. J., to Point Pleasant? As far as I can find out, from Sunday to the present time there have been some 80 arrested and fined. In Point Pleasant they fine them for exceeding 10 miles per hour. Some got fined when found they were going only 12 miles per hour.

It's the same old story; the speeders get away and the more careful and sane users of the road have to stand for all the bad that the reckless drivers did this Summer. Right here I would like to appeal to all users of the automobile to drive with care and cut out the road racing. If you don't it will be only a short time till we will have to quit autoing in the country, as the small towns are going to make it hot for us. There is no use in saying they cannot do so, because they can, as some found out Sunday around here as it stands now. Every time we go out we are in fear of arrest, and if that feeling is caused to be kept up, it is going to kill autoing for pleasure. R. A. C.

Asbury Park, N. J.

POINTS OF INTEREST TO AUTO REPAIRERS

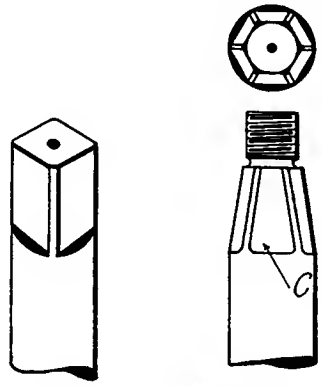
AS a rule, all threaded connections in the gasoline line should be soldered, as this is the only way to insure their permanency. Occasionally, however, it is inconvenient or undesirable to solder such a connection, and in that case other means must be taken to insure its tightness. Dry soap is frequently used for such joints. A better substance, however, is a hard paste of soap and fine emery. The emery cuts the threads and permits the joint to be screwed together further and tighter than soap alone, while making a joint that can easily be taken apart.

One of the accompanying illustrations shows a handy wrench, which can be made in a few minutes from a scrap of ⅛ or 3-16-inch flat iron stock, for gasoline valves having squared stems unprovided with a handle or wheel for turning them. By shaping the end as illustrated, the wrench is easily guided to the correct position on the stem, even when the latter cannot be seen and the valve has to be closed by feeling only. A strong string or bit of chain may be run through the wire ring and secured with a few inches of slack to the valve itself, thus making the wrench always handy when it is wanted.

Homemade Gasoline Valve Wrench.

Filleting Shafts with Squared Ends.

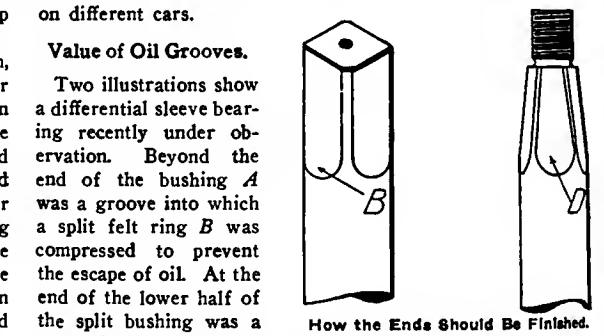
A shaft to which a gear is attached by a squared or hexagonal section at one end is obviously weaker at that end than elsewhere, unless the end has been enlarged so that the diameter over the flats is equal to the diameter of the round part of the shaft. In some cars this precaution has been overlooked, and the flats are milled off from the round contour of the shaft, which is thereby reduced in section. Among the parts in which this construction will be found are the live axle shafts, the differential shafts of a chain-driven car, the bevel pinion shaft of a live-axle car, and the shafts to which the propeller shaft universal joints are attached. A shaft containing no more than 40 "points" of carbon, or a nickel or chrome nickel steel shaft, will twist noticeably before it breaks, provided it has a chance. If the rear axle is of the floating type, the squared ends of the shaft will be a loose fit in the differential gears and the wheel hubs, and there will probably be ⅛ inch or more where the squared portion adjoins the round, where this twist will appear. If at this point there is a well-defined shoulder, *A*, the fracture when it comes will take place at the shoulder, and it will probably occur a good deal sooner than if there were an easy fillet *B* connecting the round and squared portions. In case the shaft is hexagonal and a taper fit in the gear, there is a chance for the same thing to occur, since the gear is not expected to fetch up against the shoulder at the end of the hexagonal portion. *D* is the hexagonal shaft with the fillet used. It is a good idea when a car is overhauled to examine shafts such as these to see whether or not there are signs of twisting. If there are, it will be policy to replace the shafts without waiting for the inevitable fracture to occur. If there is no sign of twisting, it will be extremely easy to help the chance of durability by putting fillets in place of the shoulders. This may be done on an emery wheel if the shoulder is small, or in a shaper or milling machine if the shaft is squared. The illustrations show good and bad forms of squared and hexagonal ends as found on different cars.



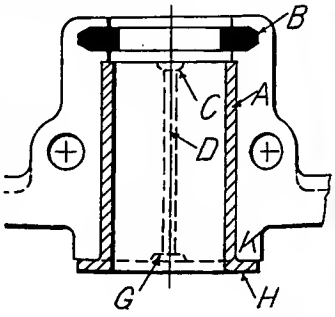
Illustrating Poor Shaft Design.

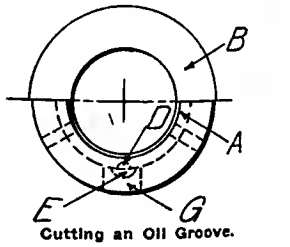
Value of Oil Grooves.

Two illustrations show a differential sleeve bearing recently under observation. Beyond the end of the bushing *A* was a groove into which a split felt ring *B* was compressed to prevent the escape of oil. At the end of the lower half of the split bushing was a notch *C* about 3-16 by ⅛ inch, by way of which it was evidently the intention for oil working to that end of the bearing to return to the gearcase. This excellent idea of the designer had in some manner gone astray, for the return oil groove *D*, which by the way was cut in the under portion of the bushing itself, was hardly more than 1-16 inch wide and 1-32 inch deep, certainly by no means large enough to afford a passage for the thick oil commonly used in gear cases, since capillary action alone would have prevented the oil from flowing, save under pressure much greater than could possibly arise. Worse than that, there was no outlet whatever into the gearcase. The inner end of the bushing was flanged at *H* and neither that flange nor the seat *K* against which it bore was recessed in the slightest. This bearing was considerably cut, and a couple of paper liners had to be put under the lower half of the bushing. In order to give a sufficient passage for the oil, a groove *E* was chipped in the seat under the bushing, and to prevent the paper liners, which now separated the upper and lower grooves, from retarding the flow of oil, they were cut away at the grooves. Since this divided them into separate right and left portions, they were shellacked to the bushing to keep them from shifting, and the bushing itself was secured by brass dowel pins. An outlet was chipped in the seat at *G*. If this treatment had not been applied, the oil reaching the outer portion of the bearing could not have escaped except past the felt washer *B* and it would have accumulated metal particles and started cutting of the shaft and bushing. Small points of construction may make or mar the service that a car will render, and regardless of how well built it may be in general, if attention has not been paid to the apparently insignificant details there will be frequent occasion for repairs.

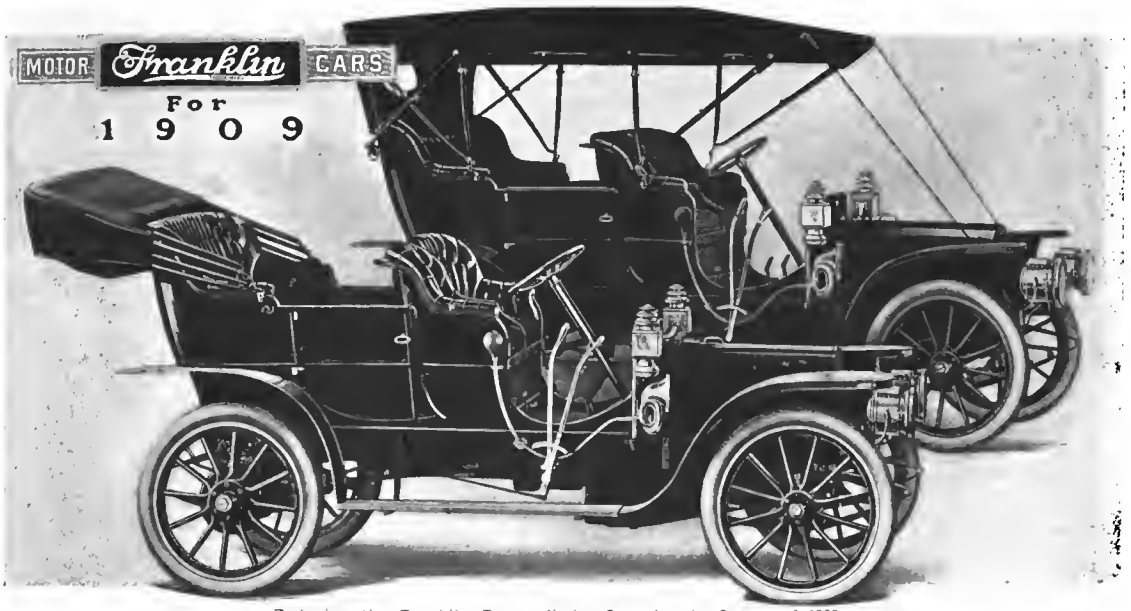


How the Ends Should Be Finished.





Cutting an Oil Groove.



Picturing the Franklin Four-cylinder Cars for the Season of 1909.

FRANKLIN cars for 1909 represent the culmination of six years of steady development, beginning in 1902 with a 7-horsepower runabout, which was the first air-cooled car to be placed on the market in this country. It certainly seems a far cry from the crude little machine of that time to the Franklin cars of the present day, but it was with that as a basis that the Franklins of 1909 have been developed, as the original principles which were embodied in this prototype of the air-cooled car in this country are still retained in the 1909 models, many of the features of which differ from those of its early predecessor merely in detailed refinement. Each succeeding year has not only marked improvement in the Franklin cars, but also has seen additions to the Franklin line, the present year being no exception. It now comprises two-seated runabouts equipped with hampers, or with single or double rumble seats, touring cars having a capacity of four, five or seven passengers, and closed cars of all types, suoh as broughams, landaulets, limousines, town cars and motor cabs.

Smallest Franklin Is Now 18 Horsepower.

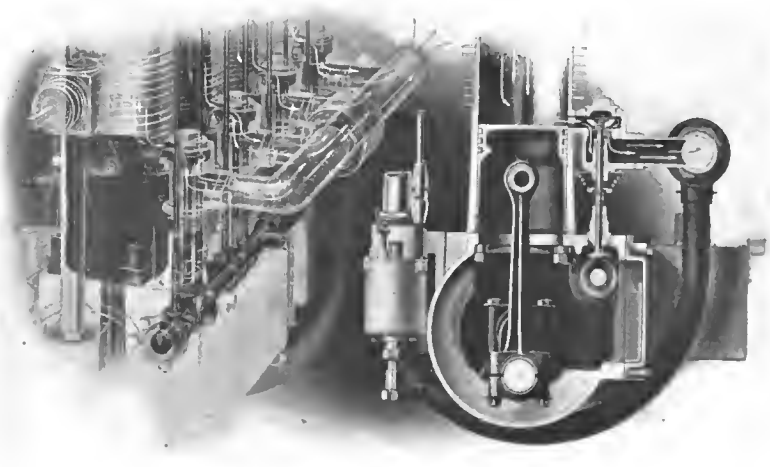
In past years the Franklin company has been turning out a very successful small car with an air-cooled motor rated at 12-horsepower, but for 1909 the smallest car which they will turn out will be known as Model G and will be rated at 18-horsepower. It has a four-cylinder air-cooled motor, the cylinder dimensions of which are 3⅜ by 4 inches. It is built on lines similar to the 28 and 42-horsepower motors, except that it is smaller and is a slower-running motor. With its added power and slightly reduced weight, Model G forms an extremely satisfactory four-passenger car, and really places it in a class by itself, when its price, passenger capacity and power are considered in the light of its capabilities.

Among the improvements made in this smallest representative of the Franklin family since the appearance of the 1908 models a year ago, probably the most apparent improvement is the use of 32-inch wheels instead of the 30-inch size formerly employed, this serving to increase the wheelbase by 1½ inches. Another change of note where the power-plant is concerned is the adoption of a Bosch high-tension magneto as the only means of ignition, in connection with a fixed point of firing. The increase in the wheelbase has also made an extension of the body possible, thus adding to the comfort and appearance of the car. In its fittings and appointments the standard body is somewhat similar to that used last season. But this model is also built witb a brougham body, making it a very serviceable vehicle for a doctor, or wherever a two-passenger closed vehicle is desired. It will also be furnished with a landaulet body similar in design to that used on the 28-horsepower car, but smaller in proportion. These bodies are built by recognized leaders in this line of work and are finely finished. The touring car, landaulet and brougham will be finished in royal blue and the runabouts with a red body and black running gear.

At the other end of the four-cylinder line of Franklins is Type D, a 28-horsepower car, which is the largest four-cylinder car turned out by the Franklin company. Its motor dimensions are 4¼ by 4 inches, and it is also equipped with a Bosch high-tension magncto as the sole source of ignition. As is the case with the smaller cars described, one of the most important changes where Type D is concerned is the adoption of 36-inch wheels instead of the 34-inch size employed during the past season. This gives a much better clearance, makes the car easier riding and adds to tbe life of the tire equipment, while also giving the car a much better appearance than with tbe smaller wheels. When built with a landaulet body, however, the 32-inch size wheels are employed, in order to make entrance to the car easier. In touring car and runabout styles this car is equipped with bodies patterned after the lines of the six-cylinder models, except that they are lighter and smaller to conform with thc lesser horsepower of the motor.

The six-cylinder model of the Franklin line, which is known

Type H, Franklin Six-cylinder Touring Car.



Views of the Working of the Franklin Auxiliary Exhaust.

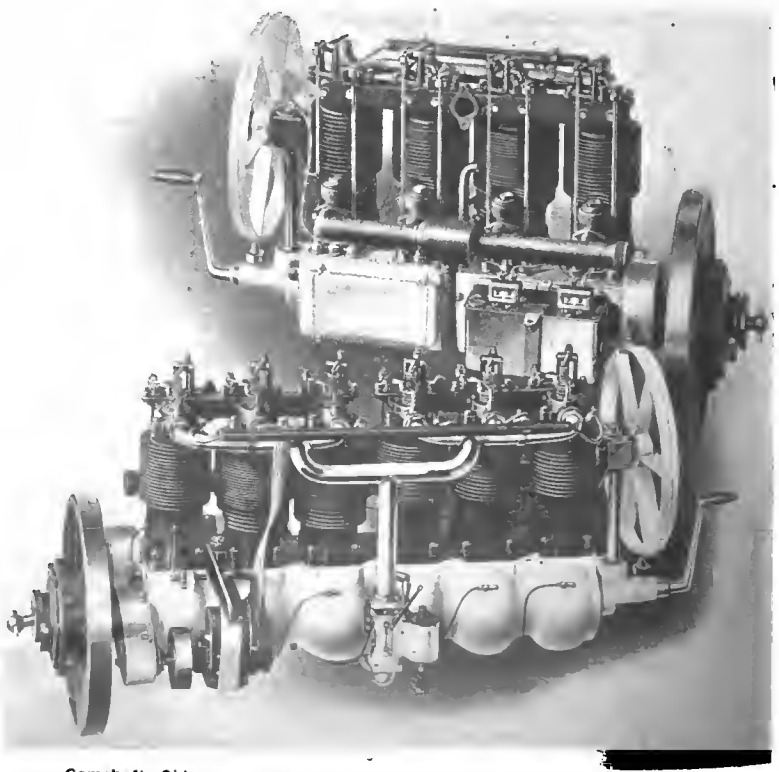
as Type H, is built in three different styles. First, as a seven-passenger touring car; second, a single or double rumble seat runabout, and third, as a seven-passenger limousine. This is the highest-powered Franklin car built and is rated at 42-horse-power. One of its features is a steering mechanism of the worm-gear type, which is made by the Franklin company in its own shops. Its design is such as to prevent any lost motion, which is of vital importance, besides being extremely easy to handle. Type H has a 127-inch wheelbase, which admits of a roomy and well-designed body, the extra seats being of the folding or Pullman reversible type, so arranged as to be readily removed, or closed up against the side of the body out of the way. For its power, this is undoubtedly one of the lightest cars on the market, tipping the scales, as it does, at less than 2,500 pounds, though listed at the latter figure.

As in the past, the power equipment of all the Franklin cars consists of four and six-cylinder air-cooled motors. In both design and construction they are similar to the Franklin motors for 1908, except in certain details, which thorough tests in the Franklin laboratories and practise have been found to increase the efficiency of the air-cooled engine. The governor, which has heretofore been considered necessary to the satisfactory working of this type of motor, is not used on any of this year's models, it having been demonstrated that with the present construction better results are obtained without it. This is due, to quite an extent, to the advances made in carbureter design during the past few years, this essential of the motor having been brought to a point where absolute uniformity of action and a perfect mixture under all conditions is assured. On the Model H there has been a slight change in the crankshaft, this being made stiffer and larger, thus adding materially to the smoothness of the engine's running.

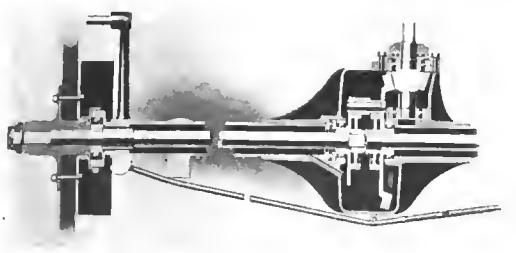
Through extensive hill-climbing tests carried on by the Franklin company it has been demonstrated that the results obtained are more or less affected by the position of the carbureter, and its location as regards a central position on the motor. A change has therefore been made by reversing the position of the carbureter, thus adding materially to the hill-climbing ability of this year's models. A demonstration of this was the work done by the Franklin cars in the A. A. A. tour, where the uniformity of their power at all times and under varying conditions was noticeable and favorably commented on by the press and contestants, showing the important results obtainable from slight changes.

A change from double or battery and magneto ignition to single high-tension magneto is a very interesting feature of the 1909 models, the Bosch system, which is used, representing the latest practice of the leading French and German manufacturers. On the Model H the magneto's action is controlled by an automatic governor with expanding arms pressing outward against the magneto's balance wheel, thus obviating the possibility of backkick. The method of wiring is also a point worthy of mention, the wires passing through a conduit so constructed as to make the chafing of wire and short circuiting impossible. The discarding of the timer has made possible several changes and the elimination of parts which slightly reduces the engine's weight, and naturally simplifies the ignition system, entirely eliminating, as it does, the possibility of timer troubles. This system was used on two of the Franklin cars in the A. A. A. tour and gave such perfect satisfaction as to merit its adoption on all of the 1909 models.

With the new engine construction the front cheek-piece can be removed without disturbing the camshaft, or the camshaft may be taken out without interfering with the cheek-piece. The starting crank in its attachment to the crankshaft has been made waterproof, and is held in place by a leather stirrup. The concentric valve and dome head cylinders are two features used exclusively on the Franklin motors, and while having made their



Camshaft Side of Four-cylinder and Off Side of Six-cylinder Motor.



The Franklin Rear Axle, Differential and Drive.

appearance on the 1908 models, have after a season's use shown themselves so important in the perfect working of the Franklin motor as to entitle them to be incorporated as features of the 1909 models without any changes.

The intake and exhaust valves are concentric, or, in other words, have the same center and take up the same space so far as using the top of the cylinder is concerned. This method of construction makes possible the using of valves having twice the area as where separate intake and exhaust valves are used. This form of valve and the dome-head cylinder fit each other, naturally leaving no corner for dead gases to lurk in, thus making the exhaust more complete, and therefore leaving greater room for a fresh charge. The area of the cylinder's inner surface through its shape is reduced, while the external or heat radiating surface remains the same. Therefore with this construction the cylinders are cooled quicker and more thoroughly than where the smaller valve and flat-top cylinders are used. Other advantages of the concentric valve and the dome-head cylinder are that the opening from the suction pipe to the cylinder is more direct. A greater amount of gas can therefore enter because of the decreased friction in the passage. The suction valve is also kept cooler by its not coming into direct contact with the cylinder head. Therefore, the gas expands less on entering the cylinder and a more concentrated charge can enter. There is less loss of heat in the cylinder, the heat expressing itself more completely in power. It also increases cooling ability by adding to the external surface of the cylinder and decreasing the internal surface. These large and small advantages of the concentric valve and dome-head cylinder are found to be effective at all speeds, but particularly at high speed on hard climbs or whenever the engine is taxed to its utmost.

The method of suspending the Type H engine is somewhat different from that used during the past season, the cross rails being made of angle steel, which also supports the magneto and oiler in a manner greatly reducing vibration and making removal or adjustment easy. A double heat accumulator, which is the method of securing warm air for the carbureter, is a new feature on the six-cylinder motor. This is accomplished by encircling the auxiliary pipe with a copper jacket and passing the heat so accumulated through the air intake pipe underneath the engine base to the carbureter. The copper case used on this motor is in addition to the regular steel warm-air collector used on all of the other Franklin engines. With the adoption of this device a considerable increase in the carbureter efficiency has been brought about by the perfect mixing of warm air in such volume as may be required by the varying conditions.

A change in the style of the oiler and method of carrying is such as would seem to add considerably to the convenience of filling the oiler. The Hancock positive gear-driven oiler of various feeds, depending on the size of the engine, is used on all models, being placed directly against the engine base where the oil is, through the warmth expelled from the engine, kept at all times in the proper condition for the most satisfactory lubrication. All the 1909 engines are equipped with a transverse slotted oil baffle plate, used in connection with the splash system of oiling, the pistons in their action forming a suction or natural pump drawing up the oil, and spraying it directly on the points required, causing a more even lubrication than through the ordinary splash system, which distributes the oil without regard to the exact points requiring lubrication and depending upon the operation of the engine for working the oil around.

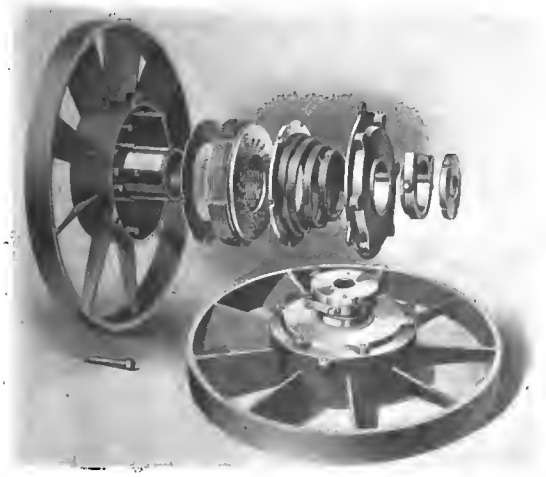
Franklin Steering Gear.

As has been their policy in the past, the Franklin Company use the lightest yet strongest materials procurable, which by thorough laboratory tests and actual practice have been found to be best adapted to air-cooled motor construction. The valve springs on all models are this year made of vanadium steel, which eliminates almost entirely the possibility of trouble from this source. As a test of these springs the Franklin cars in the A. A. A. tour were so equipped, and covered the entire tour with absolutely no trouble whatsoever. By a change in the position of the carbureter, the connectionless intake pipe has been altered, making a more direct passage for the gases.

The auxiliary exhaust is an exclusive feature on the Franklin, which, through its unique construction and position, these valves being at the base of the cylinder, dispel 71 per cent. of the burnt gases immediately on the completion of the power stroke, the remaining 29 per cent. passing out through the main exhaust, which, not being connected with the muffler, makes back pressure impossible and thus obviates the necessity of a muffler cut-off. These valves are mechanically operated by the camshaft in a similar manner to the regular exhaust valve.

The clutch is of the Franklin multiple disc type, the discs being made of phosphor bronze and steel alternated. The phosphor bronze discs are prevented from rotating by bolts, but are free to move laterally by friction gradually exerted through a spring. The discs are thus made to revolve, and, pressing out the oil, are brought into action without grabbing.

Two styles of change gear lever arrangement are used on the coming season's models, the selective type being used on all models except the 18-horsepower Model G, these being equipped with the self-finding gear shift. The selective type is so constructed as to be entirely free from lost motion, and is positive in its action. Whenever the lever is brought to a vertical posi- spring tension. The absence of the H-guiding plate used as a rule on the selective type transmission is noticeable. Operation between change gear lever and transmission is direct, all intermediate complications being entirely done away with. Through the arrangement of gears and operating levers it is possible to pass from one gear into another without disengaging the clutch.



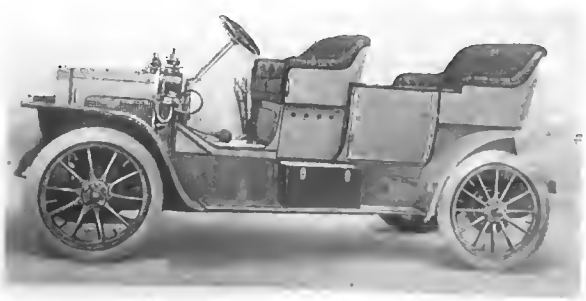
Essentials of the Franklin Multiple Disc Clutch.

The 1909 White Steam Cars

Model M, the 40-horsepower White Steamer for the Coming Season.

UNUSUAL interest centers each season in the plans of The White Company, because the White Steamer is a distinctively American machine, and the annual announcements dealing with the development of its characteristic features are certain to be something more than echoes of the doings of foreign designers. Furthermore, the announcements of The White Company are of interest, not only to the automobile public, but also to engineers all over the world, because the power plant of the White car is known to them as the most economical and efficient steam power plant ever devised, and the White generator as being radically unlike any other type of steam-making device. As in 1907 and 1908, the White steam car for 1909 will be built in two distinct models, which, while differing from each other widely in power, in size, and in price, resemble each other in their general lines of construction. The horsepower ratings of the two models are based on the actual power delivered at the rear wheels, not the power delivered at the engine.

The larger of the new White cars will be known as the Model M, and will be the successor of the Model K of the present season. The Model M is rated at 40-horsepower and sells for $4,000, with the usual equipment of acetylene headlights and tank, oil lamps, horn and tool kit. The wheelbase is 122 inches; the front tires, 36 by 4 inches, and the rear tires 36 by 5 inches. The car is regularly fitted with a straight-line seven-passenger body. The engine is compound, of new design, described in full below. The high-pressure cylinder is of 3½-inch bore; the low-pressure cylinder of 6-inch bore, and the stroke is 4½ inches. The frame is of armored wood, the reinforcing plates of nickel steel being fastened on both sides of the wooden sills. The front axle is of a tubular type; the front springs are 44 inches long and 2½ inches wide; the rear springs 55 inches long and 2½ inches wide. Both the foot-brake and the hand-brake act on drums on the rear wheels, the former being of the expanding type and the latter of the contracting type.



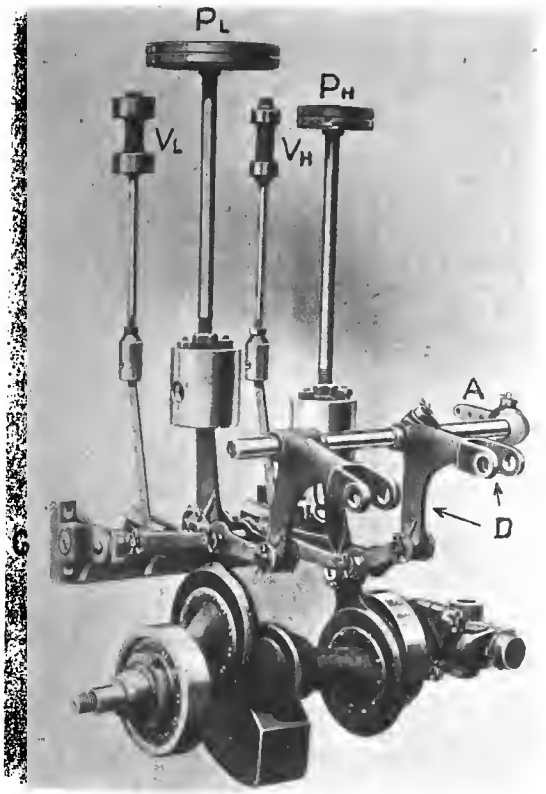
Model O is a 20-horsepower Replica of the Larger White.

The smaller of the new White cars will be known as the Model O. This car may be described more appropriately as a smaller edition of the new Model M, rather than as a successor of any previous model. The Model O is rated at 20 horsepower and sells for $2,000. The wheelbase is 104 inches and the tires, both front and rear, are 32 by 3½ inches. The car is regularly fitted with a straight-line five-passenger body. The engine, except as regards size, is identical with that in the Model M. The high-pressure cylinder is of 2½-inch bore, the low-pressure cylinder is 4¼-inch bore; the stroke is 3 inches. The frame is of heat-treated pressed steel. The front axle is a one-piece forging of I-beam cross-section. The front springs are 37 inches long and 1¾ inches wide; the rear springs are 45 inches long and 1¾ inches wide. Both the foot-brake and the hand-brake act on drums on the rear wheels, the same as on the Model M. As in the larger car, the water tank is placed under the footboards and the fuel tank is in the rear.

The White Engine Improvements.

The principal mechanical change in the new cars, as compared with previous White models, is in the engine. As previously mentioned, the engines in the two new models differ only as regards dimensions, and, therefore, the following description applies to both models. The new engine construction has been undergoing a thorough trying-out for two years, and both the Model M engine and the Model O engine have been subjected to tests of over 30,000 miles of usage, and, therefore, may be regarded as thoroughly seasoned products. The change in the engine may be summarized as follows: In the place of one standard type of valve mechanism another standard type of valve mechanism is used. In former years the engines used in the White cars were fitted with the Stephenson link motion, which was actuated by eccentrics on the crankshaft, as were also the pumps. The new White engines are fitted with the Joy direct valve action, which is operated from the connecting rods; and the pumps, all of which are located on the left-hand side of the engine, are driven directly from rocker arms, attached to the levers of the valve-operating mechanism.

This new construction permits of a great simplification of the engine. The number of parts is reduced almost to a half of those formerly necessary, considerable weight is saved, all eccentrics are done away with and the cylinders are brought close together, permitting the use of a short one-piece crankshaft.



Complete Working Parts of White Compound Engine.

PH, high-pressure piston; PL, low-pressure piston; VH, high-pressure valve; VL, low-pressure valve; G, valve guide, by tilting which the engine is reversed; A, rocker-arm which drives the oiler; D, rocker-arms which drive the pumps.

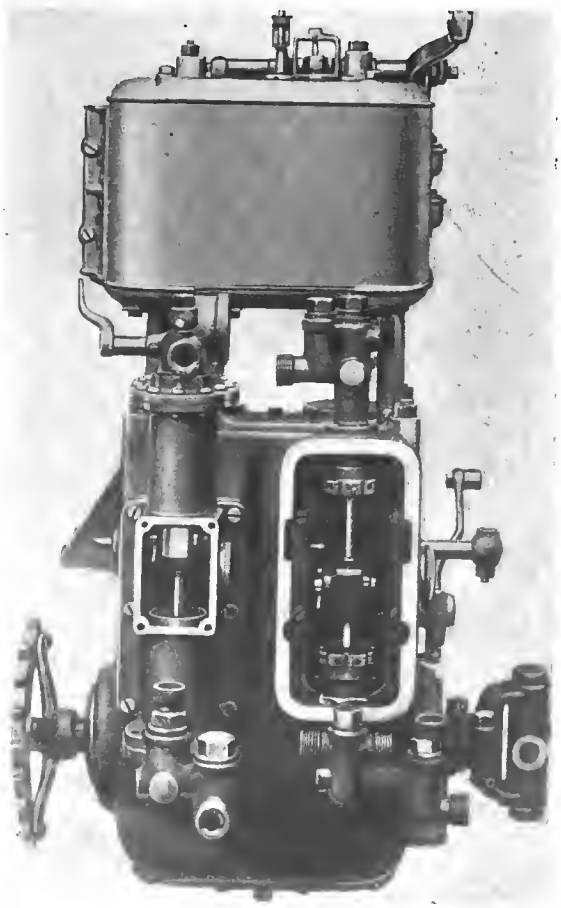
The new crankshaft is a one-piece forging of tool steel, and, as shown in Fig. 2, there are but two mainbearings to the crankshaft. This is a most advantageous construction, because when three or more bearings are used in any shaft there is always a possibility that they may get out of alignment. The main bearings are of the annular type and may be removed from the crankshaft by taking off the lock nuts and lock washers, as shown in Fig. 2. The two main bearings and the two connecting rod bearings are fitted with ball separators, and the balls are of extra large size. The connecting rods are one-piece forgings.

In Fig. 3 are shown all the working parts of the new White engine, the pistons, crossheads, connecting rods, crank, valve mechanism and pump levers. It will be seen that both the high-pressure valve and the low-pressure valve are piston valves. Steam is admitted through the center of the valve and exhausts at the ends. The pressure on the valve stuffing-boxes is thus reduced to that of the exhaust from the respective cylinders. The small arm, *A*, on the end of the pump rockershaft is connected by means of a rod to a ratchet device which drives the oiler placed on the dashboard. The sprocket on the forward end of the crankshaft is connected by chain to the fanshaft, and the ratio of the sprockets is such that the latter runs faster than the engine. The fan itself is not rigidly fastened to the shaft, but is connected by an ingenious ratchet device which permits the fan to run ahead of the shaft. Therefore, when the engine is stopped or slowed down the fan continues to run as long as its momentum persists, thus preventing any back-lash in the chain. The fanshaft housing is held in place by eccentrics and the tension of the chain may be readily altered by turning these eccentrics. As a good draft of air between the condenser tubes is an important element in securing good condensation, which means good economy in water consumption, these improvements in driving the fan are of no little importance in the running of the White cars.

Accessibility Is a Prominent Feature.

The crankcase of the engine is made in one piece, but ready access may be had to all the parts within by the removal of the side and bottom plates, and the crankshaft may be taken out through either end. The new engine permits of a pleasing and symmetrical arrangement of the necessary piping, and everything under the bonnet is easily accessible. Stuffing-boxes are fitted to the upper end of the slides in which the crossheads travel, so that no oil may be splattered out of the crankcase. There are the most thorough provisions for keeping everything within the crankcase well lubricated. The cylinders are provided with relief valves for getting rid of any water which may be in the cylinders when starting the engine "cold." These valves are opened momentarily by a small lever on the dash, before admitting steam to the engine, and the entering steam quickly and effectually removes the water.

The engine is so adjusted that it runs normally on the "cut-off," that is, the admission of the steam to each cylinder is stopped before the end of the stroke and the steam then works expansively for the balance of the stroke. In starting the engine, the pushing of the "simpling" pedal allows the engine to take steam during the full stroke. There is also a "cut-off" pedal which, when passed, produces the same results. This "cut-off" pedal is used only when slow, hard pulling is required, as in climbing particularly steep grades or running over very



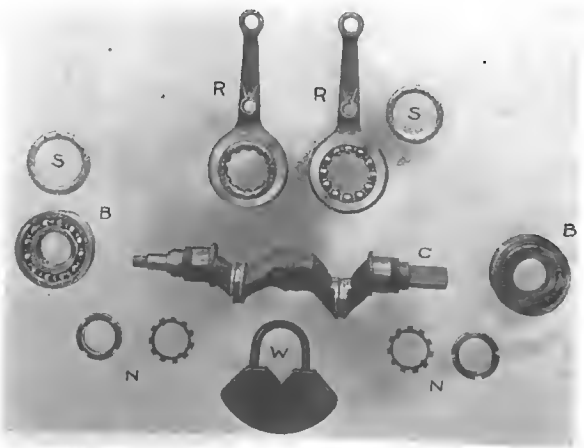
The White Engine Ready to Place on the Chassis.

Steam Generator of the White Cars.

heavy roads. An interesting feature of the Joy valve mechanism is that, when the "cut-off" is changed, the "lead" of the valves is unchanged and the engine thus runs more smoothly on "cut-off" than was possible with the Stephenson valves. The engine is reversed and the "cut-off" is changed by simply changing the tilt of the guide, *G*, as shown. The engine is supported on two cross-members of the frame, which are so placed that the entire weight of the engine is behind the front axle. The engine is so hung that the driving shaft is perfectly horizontal, and, as there is neither clutch nor transmission gear on the White, the drive is direct and positive from the engine through the driving shaft to the rear axle.

Unique System of Steam Generation.

The exhaust pipe from the engine to the condenser is located on the right-hand side. Within this exhaust pipe there is a coil of piping, through which the water from the pumps circulates on its way to the generator. This arrangement thus constitutes a neat and compact feed-water heater, which performs the double function of heating the feed-water and of aiding the process of condensation. The generator is of the same construction as in former years. For those who are not familiar with this device, it may be said that the White generator, shown above, consists simply of a series of coils of steel tubing, placed one above the other, and connected in series. If the whole were to be unwound and straightened out, the generator would be seen to be made of a single long piece of tubing. In operation, the water is pumped into the upper coil and steam issues from the lower coil. There is but a very small quantity of water in the generator at any given moment (in the larger car the total capacity of the generator is less than one-third of a cubic foot), but the process of making steam is so rapid that steam is always available in the quantity which the running



Crankshaft, Connecting Rods and other Essentials.

conditions may make necessary. In both the Model Model O cars the generator tubing is of ½-inch interna eter, but the length of tubing used differs, of course.

The system of regulation, whereby the temperature ar sure of the steam are kept constant without in any way e or requiring the attention of the operator, is the same new models as in the 1908 machines. To describe bri scheme of regulation, the supply of water to the genera the supply of fuel to the burner are so controlled as al be in perfect balance with each other. As soon as th pressure rises appreciably above the normal working p both supplies are at once cut off. As soon as the pressur at all below the normal both water and fuel are supplied portionate quantities. The devices which regulate the fu ply and the water supply are positive in their action, no delicate parts, and depend for their operation only o perature and pressure, forces which are absolute in thei ing. External atmospheric or climatic conditions in n influence the action of the regulating devices. In conclu may be stated that those who know the White car will h difficulty in recognizing the new models at a glance, a exhibit the characteristic external features which dist the cars of this make—now entering upon their ninth yea

A NEW METHOD OF AUTOGENOUS WELD

Of unusual interest to the automobile trade is the new of autogenous welding developed by A. K. Schaap, 344 C land street, Brooklyn, N. Y., and recently demonstrated ir for the first time. The improved form of blowpipe i by Mr. Schaap makes it possible to obtain temperatures o 4,500 degrees, using only an air blast and a small amo city gas. Even higher temperatures may be obtained use of acetylene.

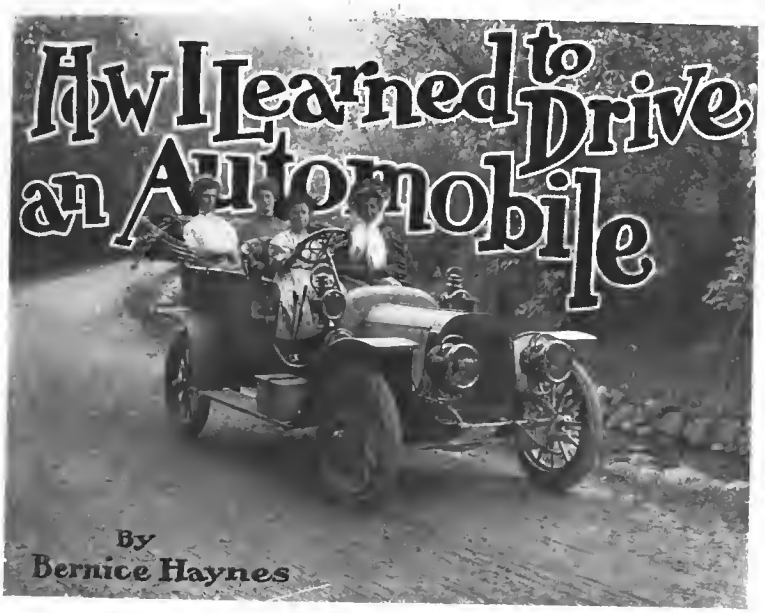
The peculiarity of the blowpipe is that it employs two s of air, one under a very light pressure, the other under 30 pounds; these mingle with the gas, and it is claime the nitrogen of the air is thrown to the outside of the leaving almost pure oxygen in the core. In this way can be obtained almost equal to those from blowpipes chemically pure oxygen in tanks, without the expense. brass, and even aluminum can be welded by this proce

An automobile rear axle was exhibited, in which the alu flange forming the side of the differential casing hac broken off and welded back in place, making the piece ently as good as new.

TASMANIA OFFERS A MARKET FOR AUT

The tariff on automobiles imported into the Con wealth of Australia has been materially reduced, and a ing to reports from Consul Henry D. Baker, of H Tasmania, a considerable field for American manufac has been opened up in that island. The duty formerl 20 per cent. ad valorem, but the new tariff has change to 35 per cent. on the body and 5 per cent. on the cl which makes a reduction on the whole car of, roughly half. Tasmania is a country of wonderful scenery and exceptionally good for this part of the world. About tourists from the mainland of Australia visited the during the last season and many of them brought thei with them. Automobilists here favor low-powered ca between 10 and 18 horsepower, preferably with four-cy engines. Most of those in use are of French or E make; unfortunately there is a prejudice against Am cars, owing to the fact that the first ones imported cheap runabouts which met with poor success on the roads of the island and were difficult to repair.

Nevertheless a good market could easily be made for American automobiles if the manufacturers were w to establish direct agencies in Hobart or even in Melbo Cars should have metric sizes of rims and spark plugs.



Miss Bernice Haynes at the Wheel—Mrs. Elwood Haynes Alongside.

FATHER has owned an automobile, or "engine buggy," as I called it, ever since I can remember. He built the first one before I was two years old, and I have ridden in them whenever I wanted to do so since then. I have never driven the first automobile father made, because I was too small when we used it. It had been standing in the factory until the Spring automobile parade in New York, in which father drove it.

I have always wanted to learn to drive an automobile. When I was eight years old I guided a two-cylinder runabout four miles into the country and father drove it back. That satisfied me for the rest of that Summer, but the next year I wanted to go farther, or to go alone. Father finally gave me permission to drive arount the block alone. I did this a great many times, always going on the slowest speed. I usually took two or three of the neighbor's children with me. Some of the neighbors would not let their children go with me, but they might as well have consented, as we did not have any accidents.

One evening I wanted to drive a car around the block. The automobile, a two-cylinder runabout, was standing in the driveway, and father said that I might take it if I would back it out into the street. I started the engine—this was about the first time I had ever done that—and I backed the automobile out of the yard. My grandmother was an observer, and she said that I would certainly be killed if I started out at that age to drive an antomobile.

One evening, just about dark, we were out riding and ran out of gasoline about three-quarters of a mile from home. We were not far from the trolley line, so father went to the factory on a street car and brought a can of gasoline from the factory in another automobile. We did not know what to do with two automobiles. I suggested that I could take one of them home. Father and mother discussed this plan for a short time and finally agreed to allow me to drive the one home in which we had been riding. Father, mother, and my brother took the other car and drove home on the slow speed. I kept very close to them all of the way, and we accomplished the run without an accident. I thought that after I had done as wonderful a thing as to drive an automobile for three-quarters of a mile without any accidents, I certainly should be allowed to do it again, but father said that I must not, because if the engine stopped I could not start it again.

About a year after this, when I was eleven years old, father had to go away. He took a car to the station, which is about a mile and a half from the factory. As there was no one else at the station who could take the automobile to the factory, father let me take it. This was the first time I drove alone on the middle speed.

I was not allowed to drive alone very frequently until last Autumn. Mother suggested that we might take a ride on some nice day and father said that I might take mother for a ride whenever she wanted to go.

The second drive I took with mother last Autumn we decided that we wanted to gather some walnuts. Father said that we must not go directly to the walnut grove, as there was a bad hill to descend on the way. We went about a mile farther than the grove, and drove back to it on another road, thus avoiding the bad hill. I had to let the engine run all of the time we were gathering walnuts, as we could not start it again. On the way back we went up the bad hill.

One afternoon this Spring I was driving in the country and noticed that the engine was working badly. It finally stopped. I thought that the battery must be out, so I looked under the rear seat and found another battery. We examined the one that was connected and connected the other one the same way. It worked well after that.

We have taken a great many other drives of from 20 to 30 miles in length. I usually go between 18 and 20 miles an hour.

Two kinds of gears are used on automobiles—the clutch gear and the sliding gear. The clutch gear is operated by a lever which releases the clutch when removed from a notch and engages it when placed in a notch. In this way there is no possibility of having two sets of gears in operation at the asme time. The sliding gear is used on most four-cylinder cars. It has a short revolving shaft fastened to the engine. On the end of this shaft is a cogwheel which communicates the power to another shaft by a larger wheel. The power is then transferred to the driving shaft by a small wheel on the former to a large wheel on the latter when slow speed is desired. The intermediate speed is secured by bringing two wheels of about the same size into contact. The high gear is in use when the driving shaft is locked to the engine shaft.

When operating a sliding gear, the clutch is released with the foot, and the lever is placed in the position for the desired speed. The clutch should be let in gradually or the gears will become damaged. It is usually best to start on the slow gear, or the engine may be stopped. With some practice and a high-powered engine, it is possibe to start easily on the high gear. When a lower speed is desired the engine should be allowed to run at a speed corresponding to the desired speed of the car. The "Haynes," the only car I have ever driven, is equipped with a patented device, so that a lower speed may be thrown in at will and will take hold when the car has slowed down enough.

The spark should usually be placed below center after the engine is started. It must always be quite a distance above center when the engine is started, or it will explode too soon, and it may result in injury to the operator.

The throttle should be opened when starting the car. It is usually best to drive as much as possible on the high gear and regulate the speed of the car with the throttle.

It is always advisable to turn all corners slowly, and to drive slowly on any wet place where the car would be likely to skid.

Small machines are often steered with levers. This is a very good way for small cars, but it is not best for the large cars, as the lever communicates all jolts of the wheel to the hands. Wheels are used on large cars and they are much more serviceable than levers.

When meeting a team on the road, it is best to go slowly, but

not to stop unless the occupants of the vehicle demand it. One should turn out well to the right, far enough in front of the team so that the driver of the carriage may have plenty of time to get on the opposite side of the road and thus avoid any confusion. When passing a team from the rear, it is advisable after giving the occupants of the carriage a warning, to pass the vehicle slowly. With a high-powered machine this may be done with the high gear with very little noise. If the gear has to be changed, it should be done before reaching the horse, as the noise made by changing gears might frighten the animal.

When driving on crowded streets it is best to drive on the slow speed and be ready to stop instantly. A warning should be sounded at every corner.

ALL KINDS OF FUEL WILL BE USED.

PARIS, Aug. 20.—The use of all kinds of fuel, economy in its use, and regularity of running will form the basis of the taxicab and light industrial vehicle contest to be held in and around Paris from October 1 to 10. On the first day out all competitors must run on gasoline; on the second and third days 50 per cent. carbuated alcohol is obligatory; during the fourth and fifth days Lepretre's "White Spirit" must be used, and on the last three days the choice of fuel is left to the competitors. Fuel consumption will be the base of the classification, the calcnlations being made on a price basis.

Two main classes are provided for in the competition, each one of which is divided into three or four sub-classes. Thus, in the taxicab competition, the first class is for six-passenger hotel omnibuses with baggage capacity; the second for four-seated taxicabs, and the third for the smallest two-passenger cabs carrying no baggage. In the delivery vehicle class there are four divisions, for motorcycles with carrier attached; vans with a load capacity of 440 pounds; larger vehicles carrying up to 1,300 pounds; and, finally, for covered vehicles capable of taking a load between 1,300 and 2,640 pounds.

During the seven days' running, most of which will be around Paris, a schedule varying from 5 to 18 miles an hour must be adhered to, with numerous controls, no speeding between controls to make up for lost time being allowed. Failure to make a control on time entails disqualification. There will be a hill climbing competition during the test, and a speed test with standing start over a distance of 300 meters. These, however, do not figure for the classification, which is made entirely on the following formula, $\frac{TC}{PxD}$, in which T is the number of hours' running; C the fuel consumption in francs; P the useful load in kilograms, and D the number of kilometers covered.

All vehicles will be placed in a closed park at the end of each day's run, one hour being allowed for oiling, filling tanks and cleaning. No repairs or adjustments must be undertaken, officers being appointed to see that this rule is observed. Whatever repairs are necessary must be done by the team on the cars and by the tools and parts they carry with them, outside help of any nature whatever being rigorously refused.

PROSPECTS FOR AUTO TRADE IN ALGERIA.

American automobile manufacturers who wish to increase their export trade would do well to consider Algeria, according to reports from Consul James Johnston, of Algiers. Automobiles are already used by wine and oil merchants who have to travel in districts as yet inaccessible by railway. The indications are that a permanent and profitable market could be created here by an American manufacturer willing to go to the expense of properly introducing his cars. A direct agency should be established, with literature in French, and demonstrating cars on the floor. No sales can be expected through catalogues alone. The duty on automobiles imported from the United States is 60 francs per 100 kilos ($5.27 per 100 pounds) on cars weighing over 125 kilos.

One of the Brush Cars Used by Washington Post-Office.

WASHINGTON POST-OFFICE TO USE AUTOS.

WASHINGTON, D. C., Aug. 22.—The Brush-Nichols Company, agents for the Brush, have entered into a year's contract with the postal authorities of this city for furnishing four Brush package wagons to be used in collecting mail in the outlying sections of the city, as well as in the business centers. The company has opened a garage in the rear of the city post-office, where the cars will be kept. The contract calls for the furnishing of the cars, together with competent operators, and it has been decided to work two shifts of men in driving them, the vehicles being in service from early morning until after midnight each day. Three cars will be used in the service regularly, while a fourth will be held in reserve.

The Brush cars have since been supplemented by two single-cylinder Cadillacs, provided and operated by the letter carriers under an allowance secured from the Post-Office Department.

It has been announced that the six cars in operation save the service of eight men and twelve horses.

This contract is remarkable in that the Post-Office does not buy the cars outright, but only rents them; the cars are taken care of and the drivers furnished by the agency. All parties concerned are benefited by this arrangement, which is in line with the modern tendency toward specialization. It will undoubtedly be found most advantageous in all cases where a company needs but few cars and cannot afford to maintain a garage department to care for them. The success in operation of the Washington equipment will be closely watched, and its economy over horses will doubtless lead to the adoption of a similar service in many other large cities where the use of horses and wagons is now responsible for much delay.

The King of Spain in Renault Which He Cont

EIGHT-CYLINDER ENGINE OF THE DIXIE II

IN view of the remarkable performance of the *Dixie II* in defeating boats of nearly double the power in the race for the Harmsworth trophy, and her later feat of covering a 30-mile course at the Thousand Islands in 58 minutes, thereby winning the final contest for the Gold Challenge Cup, some particulars of her engine are naturally of interest.

Speaking in general terms, the engine is of the Antoinette type, carrying 8 cylinders arranged in two sets at an angle of 90 degrees from each other, with pistons working in pairs on a four-throw crankshaft of general form, similar to that used in four-cylinder engines. This type of engine was chosen for the saving in weight of crankshaft and crankcase which it permits. In details, however, the engine differs considerably from that of its famous prototype. The engines against which it competed were of the ordinary automobile type, but the engine of the *Dixie II* may fairly be said, for the large cylinder dimensions and the special purpose for which it was designed, to mark an advance over the automobile type. The cylinders are

Engine of Dixie II, Winner of Harmsworth Trophy.

7 1-4-inch bore and stroke, the extremely short stroke common in automobile construction being avoided because it would mean an undesirable increase in the revolutions per minute. Automobile engines of this size have been found to give considerable difficulty in the matter of keeping the valves and piston heads cool, and this fact has necessitated using lower compressions than are customary in smaller sizes, with a resulting sacrifice in power. To a large extent this over-heating is avoided in the engine of the *Dixie II* by the use of auxiliary exhaust ports uncovered by the pistons. A special set of cams operates poppet valves controlling these ports.

The cylinders are cast separately, and the inlet and main exhaust valves open directly into the heads. The water jackets are cast in skeleton only, and are closed in by brass plates screwed over gaskets. A single camshaft operates all the valves. The cams are under cut, and the inlet valves are pulled open against their own spring tension by strong springs, so that one cam operates both valves of each cylinder. A separate shaft carries the cams for make and break ignition.

The crankcase is a manganese bronze casting, and the oil pan, as usual, is aluminum. The pistons, wrist pins and connecting rods are of quite extraordinary lightness, and the last named are hand forged of alloy steel. To secure adequate bearing surfaces at the crank end of the connecting rods without unduly elongating the shaft was a difficult problem, whose solution was found in the novel expedient of giving one connecting rod of each pair a bearing over the entire crankpin, and so forming the outside of the big end of that rod as to afford a bearing for the other rod. In other words, one rod works on the pin and the other rod works on the big end of the first rod. Naturally this implied a special design for four of the rods, but the two sets of rods are nevertheless alike in weight.

Lubrication is effected by a pump which takes oil from a well at the after end of the crankcase and forces it through a filter from which the main bearings and the pistons are supplied. Splash is not depended on, and in fact the cranks do not dip into the oil. Each of the main bearing bushings has a central annular grove to which oil is fed, and this groove registers with a hole drilled in the shaft. The shaft and cranks are bored hollow and of rather large diameter, and the ends of the holes are closed, thus forming oil chambers which, under normal conditions, are constantly filled with oil from the main bearings. Passages drilled in the cranks carry the oil to the crank pins, and from these it escapes to the crank pin bearings. As an illustration of the extreme refinement necessary to keep the engine within the required limit of weight, it may be remarked that the crank pin bearings are lined with white metal only 1-32 of an inch thick, these linings being cast in the rods and bored to size.

Reversal is affected by planetary gearing carried in a frame bolted to the after end of the crankcase. A friction clutch starts the propeller in the forward direction, and positive dogs take the load when the clutch has nearly ceased to slip. The cylinders are cooled by eight separate plunger pumps, which deliver water through separate pipes so that each cylinder is sure of getting its share.

The flywheel is a manganese bronze casting, bolted and keyed to a large flange at the forward end of the crankshaft. The carbureter is of Crane & Whitman design. It has no auxiliary air valve, this being considered undesirable for racing purposes.

The engine weighs complete about 2,200 pounds, including reversing gears and pumps. It is capable of developing approximately one horsepower for each ten pounds weight, and its maximum speed is somewhere between 850 and 900 r.p.m.

PARIS-TO-THE-SEA HAS SMALL ENTRY.

PARIS, Aug. 20.—Paris-to-the-Sea, the annual cruise and race which the capital has put on foot for a number of years, with varying success, is this year almost entirely an outing of amateur motorboat men, the trade element being conspicuously absent. When the start took place at Maisons-Laffitte, the Parisian suburb, the fleet did not number a dozen, and among them was not a single really fast boat. *Delahaye-Nautilus,* one of the Monaco champions, gave a demonstration of speed and was followed by the *Fauber,* the curious hydroplane built and owned by W. H. Fauber, formerly of Chicago, but neither boat went with the fleet, and it is doubtful if they will go later to Havre and Trouville for the races.

The cruise, which lasts eight days, will take the boats down the River Seine by easy stages until Havre is reached, when racing commences.

THE LIGHT CAR COMING INTO ITS OWN.

In histories of the automobile industry written from the viewpoint of future decades, the year 1908 will undoubtedly stand forth as one of the most noteworthy periods of transition. Not that there have been any important inventions or revolutionizing discoveries, which were formerly so freely predicted—far from it. The science of automobile design, as far as its fundamental principles are concerned, is as fixed and definite as any other branch of engineering. But now, for the first time, we have realized and made full use of the immense progress in refinement and detail.

Hitherto the large car has been the one and highest ambition of every automobile manufacturer; no one seemed to regard himself as firmly established in the industry until he could exhibit a model of from 40 to 60 horsepower. The oldest makers, it is true, worked their way up more or less gradually from the small car; later comers built small cars for one year, at most, and then jumped into the large car class.

Some critics have called this movement a mere craze for speed and power. But that is hardly just; these men saw the boundless possibilities of the automobile, and were striving to realize them in the easiest and most obvious way. They wished to build a car which could go anywhere—climb mountains, plow through mud hub-deep, cross trackless deserts—and they succeeded. Their cars have strength, power, and reliability, but they are too expensive, except for buyers who want cars *de luxe*.

But what was a problem solved itself, as problems often do. While engaged with other and apparently more important questions in large car construction, designers had gradually been improving the efficiency. Every year the same cylinder bore, the same gallon of gasoline, has been made capable of doing us more work. Now, all at once, they have realized that they can build a car of twenty horsepower with all the ability of the earlier forties and sixties. Thus, in the development of the once scorned and neglected light car, has appeared the true solution.

Manufacturers and buyers alike are now beginning to understand that high power, in itself, so far from being an advantage, is in reality a drawback. It is costly, wasteful, and dangerous in the hands of inexperienced or reckless persons. Only the ability which it confers is desirable, and now we can obtain the same ability with half the power and half the expense. Four cylinders of say four inches bore, will carry five persons everywhere they wish to go, quickly, surely, and comfortably, with a bill for gasoline, oil, and tires that is astonishingly low.

These light cars are not merely reduced-size copies of larger models. Their designers have taken full advantage of every improvement in large car construction, and have seized upon several ideas, such as block-cylinder casting and unit construction, which, though of uncertain origin, seemed peculiarly adapted to their ends; but they have also shown remarkable ingenuity and resource in many less noticeable places. Add to this a factory organization and equipment scarcely thought possible a few years ago, and the modern light car appears. Next season it will assume its proper position as a most important class.

* * *

WHAT THE LONG ISLAND PARKWAY MEANS.

The building of the Long Island Motor Parkway is of great significance to the American automobile industry. In its influence, rather than in the results accruing from its direct use, will be found a large part of its value, for if a special highway for automobiles can be built and maintained in one part of the country, there is no reason why similar enterprises cannot be set afoot wherever the population is such as to warrant it, and there are not a few parts of the United States where the automobiling fraternity is sufficiently numerous and progressive to support such an undertaking.

Not the least part of its value will be found in the demonstration that it will afford of the fact that the dustless highway is a practical possibility of the near future, and its influence in this respect should not only prove of value to others backing similar enterprises, but to the course of highway improvement in this country as a whole, for the dustless road is as much of a necessity to horse traffic as it is to the automobile. Since there will be no horse-drawn vehicles on this parkway, it will be possible to see just what effect the surface of the specially constructed highway will have upon tires and also what effect tires will have upon the road. Considered in whatever light it may be taken, the parkway is bound to be productive of valuable and lasting results. Its construction shows that, the automobile having developed to a high standard, the creation of highways on a par with it is in order.

A. A. A. GRANTS A NUMBER OF SANCTIONS.

New York, Aug. 25.—At a meeting of the Sanction Committee of the Racing Board of the American Automobile Association, held at the national headquarters, 471 Fifth avenue, to-day, applications for sanctions for various events to be held in the near future were granted to six different organizations affiliated with the A. A. A., the applicants having complied in every way with the rules of the Racing Board. The sanctions granted were as follows:

. Automobile Club of Minneapolis, hill-climb; Automobile Club of Minneapolis and Automobile Club of St. Paul, joint auspices, race meet; San Antonio (Tex.) Automobile Club, 12-hour endurance contest; Wildwood (N. J.) Motor Club, speed trials; Sonoma County Automobile Club (Santo Rosa, Cal.), race meet; Richmond (Va.) Automobile Club, race meet.

Reservation dates were also requested for sanctioned events to be held in the near future at Poughkeepsie, N. Y., Hot Springs, Ark., and Washington, D. C.

TWO MORE VANDERBILT CUP ENTRIES.

It was stated from an authoritative source on Wednesday that an entry of a Thomas car for the Vanderbilt race, to be held over the Long Island Motor Parkway, October 24 next, had been mailed direct from the offices of the E. R. Thomas Motor Company, in Buffalo, to Jefferson De Mont Thompson, chairman of the Vanderbilt Cup Commission.

In addition to this entry, word comes from Trenton that the Roebling car, now under construction there by W. A. Roebling, would also be entered. This is a four-cylinder machine, the motor of which has developed 140 horsepower under tests. It is expected to be ready for the road by September 15. An entry of a Knox car is also looked for. The first entries close Tuesday next, September 1, on which date W. K. Vanderbilt, Jr., is expected to return from abroad.

AUTOMOBILE NEWS MADE IN GERMANY.

Berlin, Aug. 20.—There is much indignation in Germany at the trick played by the Italians on the trade and press of the rest of Europe. Reports from Turin declared that the victorious Mercedes Grand Prix team had been entered for the Bologna meet, and on hearing this several other big firms sent in entries, only to find that the whole thing was a hoax.

It will be remembered that Belgium gave up its Ardennes race this season in order not to conflict with the Bologna meet, and was to receive the benefit of a reciprocatory action on the part of the Italian A. C. next year, when Belgium was to be the only country to hold a big event after the Grand Prix.

PRESIDENT RECEIVES THE THOMAS CREW

The Thomas car which won the New York to Paris race is en route to Buffalo on a demonstration trip, in charge of George Schuster and George Miller, its victorious crew. Joseph Tracy is accompanying the outfit and will make a report of the conditions and running of the car on the trip.

Last Friday the car, its crew, and Harry S. Houpt, its entrant, were received by President Roosevelt at Oyster Bay. The President was much interested in the story of the trip and congratulated its crew on their victory, declaring that it added another leaf to the laurels America won at the Olympic games.

AMERICAN EXHIBITORS IN PARIS SHOW.

Paris, Aug. 20.—Entries for the eleventh annual Paris Salons, to be held in the Grand Palais during November and December, closed on Saturday, August 15, the total of the demands for space being quite equal to previous years. In addition to the numerous makers of machine tools who show their products through agents, America will be directly represented by Ford, Cadillac, Buick, Goodrich tires and Rushmore searchlights.

THAT UNSANCTIONED BRIGHTON MEET.

The E. R. Thomas Motor Company, of Buffalo, has plainly indicated that it does not approve of the proposed unsanctioned race meet to be held at the Brighton Beach racetrack Friday and Saturday, September 11 and 12, under the auspices of the recently formed Motor Racing Association. The position of the Thomas company is set forth in the following letter, written by E. R. Thomas to the American Automobile Association, with authority to publish it:

"All the Thomas cars entered in the 24-hour race to be held at Brighton Beach, September 17th, have been withdrawn for the reason that the E. R. Thomas Motor Company cannot permit any of its cars, over which it has the slightest control, to participate in a race which has not received the sanction of the American Automobile Association, as it would disqualify our cars and our drivers from all events outside of the metropolitan district.

"We believe that racing must be controlled by an authoritative body, and as the A. A. A. has been controlling racing for some years, we see no reason why the conditions should change. In assuming this position, I feel as if we voice the sentiment of the largest majority of manufacturers, without whose assistance races cannot be successfully run.

"Under instructions, H. S. Houpt has withdrawn his entries in the Brighton Beach race."

(Signed) Edwin Ross Thomas,
President E. R. Thomas Motor Co.

Nevertheless, it is said that while H. S. Houpt has not yet entered a car, he will do so if arrangements can be made to obtain one. It is now understood that a total of 14 cars has been guaranteed, two each from the following firms: Wyckoff, Church & Partridge, Lozier Motor Company, Fiat Import Company, Renault Frères Selling Branch, Palmer & Singer, C. M. Hamilton, representing Isotta, and L. C. Moskovics, Allen-Kingston. Report has it that both A. A. A. and A. C. A. officials are prominent in the management of the meet, among the former being Charles Jerome Edwards, president of the Long Island Automobile Club. However, Mr. Edwards is at the present in California, and from a close personal friend comes the statement that he is confident Mr. Edwards has not authorized the use of his name in this connection.

QUAKERTOWN'S PROJECTED STOCK CAR RACE

Philadelphia, Aug. 24.—With the 200-mile stock car race an almost positive fixture in the Founders' Week entertainment programme, the question has arisen as to whether to run the affair under the sanction of the A. A. A. or under the rules of the A. C. A. The feeling in this city among automobile club members generally seems to be that the race should be run under the rules of the A. A. A.

Meanwhile preparations for the event are going on, and this despite the fact that official permission to use the Fairmount Park roads has not yet been given. But the Mayor is strongly in favor of it; so are his directors, many Councilmen and last, but not least, "Jim" McNichol, the "boss" of the city, who owns several cars and will do all in his power to boost the game.

RULES FOR SAVANNAH'S LIGHT CAR RACE.

Rules for the light car race which the Automobile Club of America proposes to run at Savannah on Wednesday, November 25, the day preceding the date of its proposed race under European rules, have been formally adopted by the club's contest committee. The race will be 200 miles and over a ten-mile course. Cars will be limited to a minimum weight of 950 pounds and a maximum bore of 3¾ inches for four cylinders.

ELLIOT SHEPARD IN BOLOGNA RACE.

Paris, Aug. 20.—America will have a representative in the Bologna race to be held in northern Italy next month under Grand Prix rules, owing to the overturning of the Bayard-Clement car, which finished fourth at Dieppe, and the injuring of driver Rigal. Elliot F. Shepard will replace the French driver.

"Good Luck!"—From "Judge."

HARTFORD DEALERS AT STATE FAIR.

HARTFORD, CONN., Aug. 24.—The original intention of the Hartford Automobile Dealers' Association to hold a show under a large tent during the week of the State fair has been abandoned, and the exhibition will be housed beneath the roof of the skating rink at Luna Park, adjoining the Fair Grounds. The floor space is the same, and then it is a real polished floor, and at night the cars can be safely tucked away from marauders. That interest runs high in the forthcoming exhibition is evident from the fact that every square inch of space has been sold out and several local dealers who were a bit backward are left out in the cold, much to their disappointment, as the prospects are excellent for doing a large business.

Every effort is being made to secure all the old-time models possible for the historical section of the motor car parade in connection with the dedication of the new stone bridge across the Connecticut. The old Selden, Locomobile No. 1, Stanley's early steamer, and many others are being negotiated for. It is the desire of the committee to portray as accurately as possible the evolution of the automobile. It is also the intention to have every commercial car in use in this city to take part in the power-wagon section, and if expectations are only half realized, it will be one of the largest turnouts ever seen in this city. Much is also hoped for from the old-timers' section, as there are many eligible for it hereabouts, and it always serves to attract a large number of people who were not familiar with the automobile in early days.

RELIABILITY RUN FOR INDIANIANS.

INDIANAPOLIS, IND., Aug. 24.—At a meeting held by the committee having the affair in charge, last Tuesday night, it was decided to hold the two days' reliability run under the auspices of the Indianapolis Automobile Trade Association, October 1 and 2. The route, as anticipated, will be to French Lick and return. The first day's run will be 140 miles and the second day's run 120 miles.

A technical committee, consisting of George A. Weidley, of the Premier Motor Manufacturing Company; W. A. Wall, of the National Motor Vehicle Company, and Howard Marmon, of the Nordyke & Marmon Company, has been appointed to arrange the rules, which will probably be similar to those used in the recent Glidden tour. All local manufacturers and dealers will have one or more entries, and it is believed that at least sixty cars will contest.

A GOOD RECORD FOR ONE TOWN'S MEDICOS.

WORCESTER, MASS., Aug. 22.—Gardner, a town of 10,000 population, just north of Worcester, has ten physicians, all of whom acknowledge that for the requirements of their profession automobiles are more serviceable than horses. Drs. A. F. Lowell and W. H. Lyman are running Knox roadsters, Dr. W. H. Ellam swears by the Buick, and Dr. J. B. Donnelly has just bought a Chalmers-Detroit. They have sold their horses and buggies. The remaining six, with but one exception, have been out in different cars within the last week with a view of investing in a machine, and they will soon be converts in fact.

THE PITTSBURG SIX FOR 1909 APPEARS.

The latest model from the shops of the Fort Pitt Motor Manufacturing Company, of New Kensington, Pa., has made its appearance on the road in the hands of Geo. von Rottweiler, its designer. One of the features of the new car is a very simple starting device, particulars of which, however, have not yet been made public. The motor has double ignition with Bosch magneto and Herz distributor with single coil. The change-gear is of the individual clutch type, the gears being always in mesh; the desired pair is engaged by means of a heavy four-jawed clutch. The internal and external brake drums have together 546 square inches of braking surface. Mr. von Rottweiler states that he recently made a trial trip across the Alleghany Mountains to New York and return in 56 hours' running time without any mechanical trouble, a few punctures furnishing the only exciting element.

Mr. von Rottweiler has resigned as managing and mechanical head of the Fort Pitt Motor Manufacturing Company, for the purpose of severing his personal business relations with some of the stockholders, and is reorganizing the company. He will hold a similar position with the new concern.

AUTOISTS WILL HELP OHIO GET ROADS.

AKRON, O., Aug. 24.—Interest in improving highways in Ohio is being given a wonderful impetus by a combination of circumstances. One of the important influences lies in the state automobile tax imposed by the last legislature. Fred C. Caley, in charge of the state licensing department at Columbus, said:

"At the end of five years the state will have collected half a million dollars from motor car owners alone for the improvement of roads. I estimate that the total income this year, the first the new license law has been in operation, will reach $100,000, and inasmuch as the licenses are issued annually only, the receipts ought to easily reach $500,000. Besides, the legislature last winter appropriated $560,000 for state aid to roadbuilding, and the income from the auto licenses is to be used in addition to that. In road building the State will contribute 50 per cent.

A FAMILY EMIGRATING BY AUTOMOBILE.

Here is a modern illustration of the thrilling stories of romance and racing often written about the contests of "squatters" who rush for the government land openings in the West. Now, for the first time, it is believed, an automobile is to be introduced as an aid to reaching the most desirable homesteads first. W. G. Raish and family, of Clarks, Neb., have started on a two-thousand mile trip to the opening of the San Luis Valley reservation, which took place August 12 last. They travelled in their Rambler car and camped out every night. Their equipment, which includes tents, cooking utensils, and a gas range, is all carried on the car. The weight of the party is 740 pounds, and that of the outfit 1,400 pounds, a total load of 2,140 pounds.

W. G. Raish and Family in Their Rambler, Fully

STEARNS ANNOUNCES SHAFT-DRIVEN MODELS

CLEVELAND, Aug. 24.—For the coming season the F. B. Stearns Company announces a new shaft-driven model, which will be practically a replica of the 30-60-horsepower Stearns, as it will embody all the characteristic features of design and construction that have made a name on the latter. It will have a four-cylinder motor rated at 24-28 horsepower, annular ball-bearings throughout, and a shaft-drive of original design. Of equal importance is the announcement that for 1909 the well-known 30-60 four-cylinder model will be made with either side chain or shaft-drive, at the option of the purchaser, owing to the pronounced preference for the latter type.

Apart from this there will be little or no changes of importance in the design of the car, a number of which are now approaching completion in the Stearns assembling room. The Stearns six-cylinder 90-horsepower model will also be continued, practically without any change, but a comparatively small number of this large type will be built. In fact, there is no "quantity" talk about the Stearns plant, as quantity and low prices are elements quite foreign to the Stearns factory atmosphere. Every effort is directed toward the production of quality.

The Stearns shaft-drive presents some new features which make it of considerable interest. Mr. Stearns and his chief engineer, Mr. Sterling, have devoted their efforts to attaining the maximum simplicity with great strength, and an examination of the design shows that they have succeeded in no small measure. An interesting feature of the drive is that it is direct on both third and fourth speeds. The point to which the Stearns side-chain drive has been developed will, however, justify the company in retaining it in those cases where the purchaser prefers this type of power transmission. A great many owners of high-powered cars appreciate its advantages and will have no other.

Everything about the Stearns plant shows that attention is being centered on the production of cars, and though the factory is small, as compared with some of the show establishments of the country, it is one of the most complete of its kind to be found, the Stearns cars being built there from beginning to end. But for the past two years its resources have been severely taxed to keep up with the demand for cars, so that now additions are being made to the factory buildings, and a large order for machine tools has been placed. It is understood that the additional equipment comprised in the latter will place the Stearns plant in a class with the really important producers.

Up to the present time most of the Stearns product has gone to Eastern selling centers, Wyckoff, Church & Partridge, of New York, the Atlantic Coast distributers, taking more than half of the entire output of the factory, and they could have sold more if factory conditions had permitted an increase in the number of cars built. During the past season, however, Chicago has developed into an excellent Stearns market, and the demand from that center will be largely increased next season.

POPE REORGANIZATION TO BECOME EFFECTIVE AT ONCE

HARTFORD, CONN., Aug. 24.—The Pope reorganization committee, consisting of H. Brommer, Frederick H. Ecker and August Heckscher, deeming it advisable that the reorganization should be brought about speedily, has fixed September 8 as the date on or before which the certificates representing the first and second preferred stock must be deposited with the Central Trust Company of New York. The notice to this effect that is being sent to all stockholders is as follows:

"The committee, acting under the plan and agreement of reorganization dated July 15, 1908, gives notice that there has been deposited with the Central Trust Company of New York more than 60 per cent. of first preferred and more than 35 per cent. of second preferred stock. As the committee deems it advisable that there should be a speedy reorganization, it has fixed September 8, 1908, as the date, or before which the first and second preferred stock must be deposited.

"Attention of the stockholders is called to the fact that the right given to acquire proposed notes of the new company, and in addition 50 per cent. of the principal of the notes acquired in par of new stock at a cost of the par of said notes and accrued interest, is conferred upon the depositors of stock, and that no such right is given to the holders of undeposited stock."

Under the plan of reorganization announced July 30 it was stated that participation under this plan in any respect whatever is dependent upon the deposit of securities with the Central Trust Company of New York within such time as may be fixed by notice from the committee. Colonel George Pope stated to-day that, in accordance with this plan, the notice setting the date at September 8 is being sent out. Those whose stock is not deposited by that date will not come in under the reorganization and will thus lose all interest in the company.

GOVERNOR FORT TO OPEN NEW JERSEY CONVENTION

NEWARK, N. J., Aug. 26.—Co-operation of the highest State official is assured the automobilists and farmers for the good roads convention that will be held at Atlantic City, September 25 and 26. Governor Fort, of New Jersey, will make the opening address. The committee in charge of the promotion of the convention is a representative one. It is made up of George W. F. Gaunt, master of the State Grange; H. B. Cook, of the Associated Automobile Clubs of New Jersey; H. A. Bonnell, ex-secretary of the New Jersey Automobile and Motor Club, and Albert Heritage, a member of the executive committee of the State Grange.

A novel and efficient object lesson is planned for freeholders, mayors, road officials and editors. It is nothing less than to carry them to the convention in automobiles, which, to the number of one hundred, have been pledged by the members of the Associated Automobile Clubs of New Jersey and the New Jersey Automobile Trade Association. The runs will start from all sections of the State and go over the roads, both good and bad, within its boundaries, thus arousing the influential men of the State to the benefits of good roads and contrasting them with the obstacles of unimproved highways. Especial emphasis will be laid on the desirability of building continuous routes. Joseph H. Wood, of the local club, will be in charge of the project, in which President Paddock and W. H. Ellis, in behalf of the Trade Association, will co-operate.

Governor Fort was given the other day a taste of the speed-trap graft that is prevalent throughout the State, by running into one himself at Point Pleasant and suffering arrest. The trap in question is declared by automobilists to be an unjust one. They instance the arrest of a man traveling at ten miles an hour, which the constable insisted was a thirty-mile rate and was upheld by the court.

NECESSARY FEATURES OF PROPOSED AUTOMOBILE LEGISLATION

IN view of the fact that several States are contemplating changes in their automobile laws for the purpose of stopping reckless driving over public highways, and at the same time giving the reasonable motorist his just dues, an interview with Walter S. Schutz, counsel for the Connecticut Automobile Association and the man who drafted the present Connecticut automobile law, which is considered a very sane statute, is timely.

"Limitation of speed," said Mr. Schutz Monday, while at the headquarters of the American Automobile Association, 437 Fifth avenue, New York, "was the sole purpose of our earlier statutes; next the identification of the car was considered of importance; then the control and responsibility of the individual operator became the main object of the law. The time is not far distant, in my opinion, when revenue will be the chief, if not the sole reason for automobile legislation. The fact that high-powered cars seriously injure the roads make it necessary to collect an ample revenue from automobilists and apply this to the maintenance of present roads and the new ones.

"There are four points which the model law must cover, viz: proper identification, control of operator, reckless driving provisions, and a clause which will prevent the establishment of traps where the law-abiding motorists are caught on technical violations and through which the speed maniacs easily escape in their high-powered machines.

"My personal opinion is that the examination of drivers, either professional or amateur, avails nothing, and is only a needless expense to the State. Indeed, I believe statistics will bear me out when I say that the great majority of accidents result from the reckless driving of experts, rather than from the ignorance of novices. I do not think we should make any distinction between private operators and professional chauffeurs.

"Public sentiment is opposed to all forms of highway robbery, and in nine cases out of ten a speed trap is operated for no other purpose than to catch a driver and hold him for a technical violation. Each day it is becoming more apparent that the only true test of proper operation is to determine the speed at a particular time, and to take into consideration the width of the highway, the amount of traffic, and the number of pedestrians and the houses along the highway.

"The Connecticut law, which has proven very satisfactory to all classes of citizens and to visiting as well as resident motorists, provides that no person shall operate a motor vehicle on the public highway recklessly, or at a rate of speed greater than is reasonable and proper, always having a regard for other property and for life and limb. Convictions under the new law have been secured under difficulty in cases where the operation of the car was improper, and the Connecticut authorities are holding the reckless in better restraint than they are held in any other State where the automobile laws are based upon speed limitations. An abstract of each conviction is furnished the Secretary of State, and in flagrant cases the Secretary of State has the power to revoke the license of the driver. It is significant that up to this time none of the reports from the courts have recommended such action on the part of State officials.

"A very important feature of the model law is the fair and liberal treatment of non-residents. In Connecticut non-residents are admitted for a period of not more than ten successive days, provided, of course, they carry a license from the States from whence they come.

"As to revenue, it seems to be reasonable to suppose that the automobilists can afford to bear the burden of the reasonable check, provided he is not unjustly hampered in the use of his car, and also feels that the money which he pays is to be used in maintaining the roads. With their constant increase in number, the power of automobilists to properly influence legislation is enormous. If the State automobile associations and the local clubs will work systematically to secure simple and uniform automobile laws, the remaining barriers between States will soon fall away, and petty and needless restrictions upon the proper operation of automobiles will disappear. But this state of affairs cannot be brought about without the co-operation of the great body of motorists at large in suppressing the reckless element."

PROBLEMS OF SUPPRESSION OF DUST ON PUBLIC ROADS

WASHINGTON, D. C., Aug. 24.—Under the caption "Dust Preventives," Logan Waller Page, director of the Office of Public Roads, has prepared for the Department of Agriculture, an elaborate paper in which he goes into this important subject very fully. The following excerpts from this paper will interest automobilists generally:

The most important problem which has confronted highway engineers in recent years is the suppression of dust on roads. Not until the introduction of motor vehicles, however, did this become a factor of sufficient importance to engage the serious consideration of road builders and road users. Fast motor traffic has reached such proportions at the present time as to shorten the life of our most carefully constructed and expensive macadam roads to a great extent, and to keep them in a loose and uneven condition. Before entering into a detailed discussion of the damage to roads from automobiles and methods for its prevention, it may be well, for the sake of those unfamiliar with the subject, to consider its cause, and why the situation has become so serious of late.

The macadam road has been developed with the object in view of withstanding the wear of iron-tired horse vehicles, and it has met successfully the demands of suburban and rural traffic until the advent of the automobile. When in its highest state of perfection, the rock from which such a road is made is so suited to the volume and character of traffic which passes over it that only an amount of dust is worn off sufficient to replace that removed by wind and rain. The dust remaining should be just enough to bind the surface stones of the road thoroughly, forming a smooth, impervious shell.

When such a road is subjected to continuous automobile traffic, entirely new conditions are brought about. The powerful tractive force exerted by the driving wheels of automobiles soon disintegrates the road surface. The fine dust which ordinarily acts as a cementing agent is thrown into the air and carried off by wind or is easily washed off by rains. The pneumatic rubber tires wear off little or no dust to replace that removed by natural agencies. The result is that the stones composing the road become loose and rounded, giving the greatest resistance to traction, and water is allowed to make its way freely to the foundation of the road.

Many remedies have been suggested and tried for meeting this new condition, but a perfectly satisfactory solution of the problem is still to be found. Some success has attended the efforts of those who have sought to find a cure for the evil, and this is encouraging when the many difficulties to be overcome in the treatment of thousands of miles of roadway are considered. It is apparent that this problem can be solved only by the adoption of one or two general methods: (1) By constructing roads in such a manner and with such materials as to reduce to a minimum the formation of dust; and (2) by treating the surfaces of existing roads with materials that will give the same results without the necessity of rebuilding.

WHAT IS GOING ON AMONG THE CLUBS

BAY STATERS MAKE GOOD THIRD MOVE.

BOSTON, Aug. 26.—It is said that three moves are as bad as a fire, but this well-known aphorism surely cannot apply to the Bay State Automobile Club, which this week made the third move in its history, taking possession of its fine new clubrooms in the Hotel Carlton in upper Boylston street. When the club was organized it located in the Hotel Lenox. Outgrowing these quarters, it went to Auburndale and for a time occupied a part of the Woodland Park Hotel. The next change was to the finely equipped clubhouse on Dartmouth street, where it has been located for some years past.

For the occupancy of the club the management of the Hotel Carlton has rebuilt a large part of the street floor of its building and has constructed a private entrance from the Hemenway street side, so that to all intents and purposes the clubrooms are as exclusive as if in a separate building, while the members have the great advantage of the hotel service both for the ordinary club purposes and for the restaurant, which is entirely separate from the hotel restaurant. The new clubrooms consist of six apartments, three of which are very large, one of them having been made by tearing out a half dozen or more ordinary hotel rooms. There are no sleeping accommodations in connection with the clubrooms, except the secretary's room, but the hotel offers all that could be desired in this respect. All the rooms have been rebuilt and refinished under the personal direction of Secretary James Fortescue and the board of directors, and the result is most pleasing. This move on the part of the Bay State Club has been effected just in time to have the new quarters ready for the opening of the fall season, with its numerous activities in the shape of contests and other events to to be held in the next two months.

CONNECTICUT'S STATE BODY MUCH ALIVE.

HARTFORD, CONN., Aug. 24.—Secretary G. K. Dustin, of the Connecticut Automobile Association, has notified the various clubs throughout the State, as well as elsewhere, of various roads now being or shortly to be repaired. The "hen-coop" bridge stretch is to be repaired immediately, and during the period of reconstruction motorists will not be able to drive from Springfield to Hartford or vice versa on the west side of the river. Coming from the north, motorists must cross the bridge at Windsor Locks, if coming down on the west side, completing the balance of the trip on the east side. The trip can be made from the north by the east side entirely if desired. This stretch is the New York to Boston one and on leaving Hartford the east side of the river should be taken.

In the immediate future the seven-mile stretch of macadam is to be laid down on the New Haven turnpike between Hartford and Berlin. This route should not be followed for at least three weeks to come, if not longer. In Branford motorists should follow the shore road and avoid the highway passing the driving park, as it is now ripped up and will be for some time to come. Leaving New Haven due north for Hartford, Springfield and Boston, motorists should keep on the left-hand side of the river coming up to North Haven as far as Yalesville and then on through to Tracey, or, if desired, the bridge may be crossed at Wallingford, then across the railroad tracks through Wallingford to Hartford. The North Haven stretch is the one between the towns of North Haven and Wallingford, which has been bitterly complained of of late.

The membership of the Connecticut association has been increased by the admission of the newly formed Litchfield County Automobile Club of Torrington, with 116 members. There are now seven active clubs.

A MID-SUMMER RUN OF THE BLUE GRASS MOTOR CLUB.

From Lexington to Paris, Ky., through the blue grass region, the county has fine roads, over 85 miles being included of solid well-oiled and well-kept roads, over which it is a delight to drive.

AVON MOUNTAIN FOR HARTFORD CLIMB.

HARTFORD, CONN., Aug. 24.—The Automobile Club of Hartford, through its committee, has scoured the country round in an endeavor to locate a "real" hill. Last year's climb was the initial event for the local club, and was in every way a success. It was thought that the same course might be used this season, but after the experience of the recent endurance run the contest committee was firmly convinced that there were other steep grades and far better adapted to a test of climbing capability. Recently, H. P. Maxim, chairman, W. C. Russell and C. H. Gillette, of the contest committee made a trip to Avon Mountain for the purpose of going over the proposed course, and as a result of their investigation of its possibilities as the venue for a hill-climb, it is more than probable that it will be selected for the purpose, as it affords a rise that will provide a hard test for the cars without any danger.

The Avon course is of fairly good surface, being a succession of sharp turns, level stretches and sharp rises; in the latter respect it is much like Dead Horse hill. The distance from start to finish is a little over a mile. October 17 is the probable date for the climb.

A PROGRESSIVE PENNSYLVANIA CLUB.

NORRISTOWN, PA., Aug. 24.—Scarcely more than a year old, the Norristown Automobile Club is certainly the most lusty infant in the game. Not content with pulling off successful endurance runs and record-breaking hill climbs, just like the

big clubs in the large cities, this youthful but energetic organization is now in a fair way of having a club house of its own. At its next meeting the club will consider the offer of Lewis E. Taubel, one of its prominent members, to take over a large modern stone mansion on the Ridge pike, above Jeffersonville, and convert it into a club house, which can be done at comparatively small expense, as the building is adapted in every way for the purpose. In addition to the house proper the handsome grounds surrounding it are admirably suited to the purposes of golf links, of which ancient Scotch game the club contains many admirers. The enthusiasm among the members over the project practically insures the success of the new venture, and it only needs the official sanction of the club to put the deal through.

BRIDGEPORT CLUB IS WARNING SPEEDERS.

BRIDGEPORT, CONN., Aug. 24.—The Bridgeport Automobile Club has begun a campaign against excessive speeding in the city limits. Residents of Connecticut avenue, a much-traveled thoroughfare which forms the eastern approach to the city, have made many complaints about this, with the result that the club's public safety committee placed flagmen on this avenue and handed all automobilists cards asking that a reasonable speed be maintained. The committee has also sent out circular letters to the members of the club requesting them to join in supporting the law, which is one of the most liberal in the country.

A. C. OF MARYLAND DRAWS UP A NEW LAW.

BALTIMORE, MD., Aug. 24.—Osborne I. Yellott, counsel for the Automobile Club of Maryland, is preparing a bill to be presented to the next Legislature, the object of which is to put an end to reckless driving in this State. It provides that no person shall be allowed to drive an automobile until he has gone before a competent jury and passed a rigid examination as to his fitness. President James S. Reece, of the club, believes that stringent legislation is now absolutely necessary. As the legislature does not meet for some time to come, the club will endeavor to have a similar ordinance passed by the City Council of Baltimore to give immediate relief to the city.

SPRINGFIELD'S SEPTEMBER CLIMB.

SPRINGFIELD, MASS., Aug. 22.—The following officials have been selected by the Automobile Club of Springfield to have charge of the automobile hill climb contest, to be held September 11 on Wilbraham Mountain, near this city:

Judges.—J. C. Kerrison, Boston, Bay State Automobile Club; Frank G. Webb, Brooklyn, vice-chairman of the racing board of the A. A. A.; A. G. Batchelder, New York, and S. L. Haynes, Automobile Club of Springfield.

Referee.—C. H. Gillette, Automobile Club of Hartford, Conn.

Starter.—Fred J. Wagner, New York.

Assistant Starter.—J. H. Bartlett, Automobile Club of Hartford.

Official Timers.—Timers Club of New York.

Clerks of Course.—To be elected from members of Springfield club.

Six cups have already been donated for competition in the climb, as follows: Worthy Cup, Cooley Cup, Massasoit Cup, Norcross & Cameron Cup, Ericka Cup, President's Cup, Mark Aitken, president of the Automobile Club of Springfield.

THAT INTERNATIONAL ROADS CONGRESS.

LONDON, Aug. 20.—Britishers will take an active part in the first International Roads Congress, to be held in Paris from October 11 to 18, under the patronage of the French government, for in addition to a delegate appointed by Parliament several papers will be read by the English delegates. Colonel Crompton will deal with "Improvements in Self-Propelled Vehicles so as to Reduce Road Wear;" the Hon. C. S. Rolls will deal with "The Effect of the Road Surface on the Vehicles;" Lord Montague has taken for his subject "The Value of Good Roads"; Rees Jeffreys deals with "Systems of Highway Administration Compared—Their Influence on Cost and Efficiency."

A De Luxe Party In Detroit.

D. W. Kaufman, general manager of the De Luxe Mo Company, and his wife and child in front of their home on ward avenue, Detroit.

FRAYER-MILLER TAXICABS NOW IN FIE

Among the first representatives of the air-cooled t car to enter the taxicab field are five Frayer-Miller car by the Oscar Lear Automobile Company, Springfie which are now running around the streets of New Yo in regular service. This new addition to the Frayer line is not a touring car made over to adapt it to the p but has been specially designed with a view to this a form of service. The power plant consists of the reg 24-horsepower Frayer-Miller, air-cooled motor, on wh blower is belt-driven, thus making it noiseless. The is so installed that it may be removed and a new one its place in less than an hour, and the same thing is al of the rear axle driving unit, which is of the heavy typ ufactured by the Standard Roller Bearing Company, a ing a three-speed gear set in combination with the d tial and axle. An extension top is provided and can down or removed in a few minutes.

GOOD ROADS ACTIVITY IN SOUTHERN CALIFORNIA

LOS ANGELES, CAL., Aug. 20.—Unless the East looks most promptly to her laurels and interests, the far West seems in a fair way to outstrip her in the race for good roads, which within the last twelve months has got going so auspiciously in almost every populous State of the Union. On July 30, at an election, the electorate of Los Angeles county, California, put through by a vote of over three to one a bond issue, having for its avowed purpose the immediate expenditure of $3,500,000 on a comprehensive system of scientifically-built county highways, totaling 307 miles. To the casual newspaper reader the brief accounts of this progressive action by an enlightened community might seem to possess only passing interest, but a more critical analysis quickly develops facts and conditions of extraordinary significance.

For one thing, let it be considered that the amount of this appropriation so unanimously made by the people of a single county of the Golden State is one-fourteenth as great as the total demanded for the entire country by the Brownlow bill, which only three years ago was defeated by the solons at Washington, on the ground that it was too terribly extravagant to squander $50,000,000 on improving the national commonwealth with good roads. For another, let it be understood that the fact of its limitation to a single county must not obscure the importance of this newest highway appropriation, for Los Angeles county is very nearly as large as is the State of Connecticut, is twice as large as Delaware, and four times as large as Rhode Island.

That the appropriation must mean really good roads is assured by the liberal basis on which it is figured. The $3,500,000 divided by 307 (the total mileage) comes to $11,400 a mile—a sum amply sufficient to the building of the type of highways that make of Europe a paradise for touring autoists. And it is just this type that it is intended to construct, for the waste of good American dollars abroad by seekers for good automobile going has been coming home more and more to the business interests of Southern California—a section which finds both growth and prosperity in an increasing touring contingent.

Already a start has been made on the kind of good roads it is proposed to build, the magnificent Huntington boulevard between Los Angeles and Pasadena being now well along towards completion. This boulevard is about ten miles in length, and besides having wide turns and easy gradients, is of ample width and splendid surface. A perfectly graded and lightly crowned foundation of unusual thickness is the basis of this example of good roads building, while the top dressing is a highly durable sort of "oiled macadam"—a dust, mud and wear-proof surfacing that secured the evenness of asphalt without its slipperiness and perishability. All of the new 307 miles will be similarly built and surfaced, the work being in charge of A. E. Loder, a United States engineer, who, for his expert knowledge of road making, was recommended to the authorities of Los Angeles county by Secretary Taft.

As for the perils of graft and misappropriation, these will be minimized by the wide publicity given the enterprise and by interested watchfulness of many and various powerful organizations, such as the militant Automobile Club of Southern California, which, with a membership of some 1,400 strong, is a power to reckon with in the affairs of the great Southwest. Indeed, in no part of the country are automobile interests more powerful than in California, in which there is an automobile to every one hundred of the population. No other State has anything like such a proportion.

Automobile Club of Southern California Is a Power.

Los Angeles has many more automobiles than any other city in the world of anywhere near its size, while the State list is increasing at the rate of 600 a month, despite a total population of only 1,800,000. Moreover, the good roads sentiment in California is on a commensurate basis, as is witnessed by the fact that other counties of the State are on the verge of putting through heavy bond issues for road building. In this way it is fully expected to attract many Eastern autoists, a proportion of whom will, of course, be certain to become permanent residents.

Probably nothing better impresses upon one the magnitude of the Los Angeles county road plans than a consideration of what these plans would involve if extended proportionately to the entire United States. The population of Los Angeles county is about 350,000, so the bond issue of 3,500,000 is equivalent to $10 for each individual in the county. On the same basis, the population of the whole country being about 85,000,000, $850,000,000 would be required to provide all of the United States with as much good roads in proportion to population as Los Angeles county is on the verge of realizing. Or, to figure on a basis of proportionate area, that of California country is one-eight-hundredth of that of the nation, which would require $2,800,000,000 to provide the entire area with roads of similar extent and quality.

The method of providing so considerable a sum of money without working hardship to the taxpayers should be of interest to many communities. The total assessed valuation of all property in the county being about $300,000,000, it was arranged that the payment of principal and interest on the bonds should be distributed over a period of 40 years, requiring the addition of only 40 cents per $1,000 per annum to the tax rate. In other words, on each $1,000 worth of property a total of $16 is to be paid in 40 annual installments of 40 cents each, so if property now worth $1,000 is, in the course of 40 years, enhanced by good roads to a value of more than $1,016, an entry on the profit side of the ledger is assured.

A more immediate result is the prompt importation to the county of $3,500,000 of good Wall Street money, which will be expended at once and the benefits of its expenditure enjoyed, while it will not have to be repaid for 40 years.

One advantage of a lump appropriation of this kind and its immediate expenditure for a system of roads is that an ideal uniformity of scientific planning and construction is thereby permitted. Surveying corps will be organized, rock quarries opened, machinery purchased and small armies of laborers hired on the most efficient and best organized basis possible. Then, when the new system is completed, the regular annual county road appropriation will be wholly available for road maintenance and the building of minor laterals.

LOUISIANA INTENDS TO HAVE GOOD ROADS AT ONCE

NEW ORLEANS, LA., Aug. 24.—The first work of the Good Roads lobby of the Louisiana Automobile Association has been to introduce a bill into the legislature creating a State tax for automobiles and to license all chauffeurs, who must first pass a strict examination. All taxes and licenses are to be turned into a good roads fund, for the improvement of the roads.

The bill has met with instantaneous favor all over the State, and there is no doubt of its passage. Autoists are to a unit in its favor, and the licensing of the chauffeurs is the part that has met with favor with the general public. Especially is this so among the farmers, who are not altogether reconciled to the "smoke wagon" as yet. They are naturally in favor of anything

that will insure better and more careful driving of cars. Then, too, the good roads proposition is one in which they are all greatly interested. And as the major portion of the legislators are from the rural districts, the bill has been admirably drafted.

The Louisiana Automobile Association is, perhaps, the only one of its kind in the South that is keeping a lobby at its ture. All of the plans of this lobby for this session and whole summer are towards the good roads proposition. roads are the one thing necessary to make the South the for tourists, and they have gone about with this idea in

PENNSYLVANIA HIGHWAYS ARE RAPIDLY BEING IMPROVE

THE work of the reconstruction of Pennsylvania roads is now making more rapid progress than at any time since the organization of the State Highway Department by Highway Commissioner Joseph W. Hunter late in 1903. Although actual work on the construction of state roads did not begin until 1904, there had been constructed up to August 1, 348 miles of improved road, and there were under contract or in course of construction, no less than 325 miles. In addition, surveys have been made and are now being made for many additional miles of state highway. During these five years every county has made application for the reconstruction of some of its roads, many turnpikes being abolished in order to secure state aid. New roads have not been built in every county, however, because the supervisors of townships have not always followed up the projects after surveys and estimates had been made.

Both Governor Edwin S. Stuart and Highway Commissioner Hunter are strongly in favor of better roads connecting with all the important cities of the state, and of the reconstruction of the old state road leading from Philadelphia to Pi This is a pet scheme of Governor Stuart's and it i that the next Legislature will be asked to make a big priation for the reconstruction of this old national h From this it is proposed to have state roads running county seats throughout the State.

The Pennsylvania State Highway Department grew o force of four men, named in 1903, and is now cons roads at a rate which, if continued, will put Pennsylvani of all other states within a few years. The yearly cons is now considerably ahead of New York, which has bec ing roads for ten or twelve years, and is in advance o sachusetts and the states of the Middle West, which are close attention to road building. Pennsylvania's road been a bitter experience for touring automobilists and a of much mortification for residents of the state, but v short time its citizens can invite tourists to visit Penn on roads as good as any in the United States.

MINNEAPOLIS ROAD-MAKERS DISCUSS DUST PROBLEM

MINNEAPOLIS, Minn., Aug. 22.—Experiments in road-oiling and surfacing, conducted by the park authorities of the principal cities in the country, were the subject of exhaustive reports made at the annual convention of the American Association of Park Superintendents in session at Minneapolis. The first paper upon the subject was read by Superintendent M. H. West, of Lincoln Park, Chicago, and this was followed by the statement of the experience of other park directors in attempting to find a dustless and automobile-resisting surface for the city drives. Mr. West reported that he had obtained the best results with an emulsion residuum and paraffin oils. By the Chicago formula the oils are mixed in the proportion of one part residuum of about 1.9 specific gravity with three parts paraffin base fuel oil. One part of the mixed oils is then combined with nine parts of hot water, to which naphtha soap is added in the proportion of 15 pounds to 500 gallons of water. Roads treated with five applications of this emulsion came through the winter in good condition. J. W. Rodgers, of Cincinnati, gave the experience of the park board of that city with a preparation similar to that described by Mr. West, but containing 25 pounds of soap.

For dust laying in cities where there are extensive stretches of gravel and dirt roads, but little macadam, a light paraffin oil is the best. Minneapolis is in this class, and Superin Wirth and City Engineer Rinker presented the city's p to the convention. The park board is now using a par and dressing afterwards with sand. Clay roads in Kan have caused trouble in the use of oil there. Superinten H. Dunn stated that it could not be used on the cla ways unless the surface was well bonded and solid; and hills the oil made the roads too slippery for horse traff periments are now being made to overcome this.

Mr. West declared himself opposed to ordinances aga use of chains and other anti-skid devices. He said that lieved that the damage done by these devices to the ro face had been much exaggerated. Assuming that the is caused by the release of a vacuum formed by a flatte and by the slipping of the tire under the tractive force by the rear wheels, it is obvious that any device which tend to prevent this vacuum, or to decrease the shearing would help in a degree to maintain the road, rather t reverse. However, Mr. West said, these effects were to some degree even when chains are used, and he me this point only to bring out that it did not seem justif prohibit the use of devices by which public safety is g when only a questionable harm to public property is aver

OHIOANS WANT AN ENDURANCE RUN AND A BOULEVARI

TOLEDO, O., Aug. 24.—Efforts of local automobile dealers are now centered in arranging for an endurance run which will take place toward the close of this month. The affair will be entirely local, in that it will be confined to Ohio, being the first of its kind to be pulled off within the confines of the Buckeye State. Plans already perfected call for a three days' run, starting from Toledo, going to Columbus for the first day, from Columbus to Cleveland for the second, and from Cleveland to Toledo for the third. No particular efforts will be made to secure speed, but, in the main, the same general regulations will be observed as those in the Glidden tour. Practic the factories having local agencies have arranged to par in the proposed endurance run.

The very pretentious idea of constructing a grand bo from Cleveland through Toledo to Detroit is now r some attention in this section. The total distance is ab miles, a portion of which could easily be built at small co Toledo Chamber of Commerce has taken interest in the taking, and it has ascertained that the road desired could at a cost of about $7,000 per mile.

The Rambler Demonstrating Car Tackling the Steep Grade at Lemont.

Rambler Climbing Stunts.—A remarkable story comes from the Chicago representatives of Thomas B. Jeffery & Co., about the performances of their Rambler demonstrating car. They claim to have found the steepest hill in the Middle West near the town of Lemont, Ill., its grade being 50 per cent. In a recent demonstration a four-cylinder Rambler carried five people up this hill. When half-way up the brakes were put on, locking the wheels, but the car slid back eleven feet of its own weight. The incline was so steep that the passengers in the tonneau could not stand.

Chadwick Wins More Honors.—According to dispatches received by H. B. Larzelere, general sales manager of the Chadwick Engineering works, at the Philadelphia branch, the Great Chadwick Six achieved more hill climbing honors by beating out the field in the Ohio Valley Automobile Club's free-for-all at Wheeling, W. Va., last week. The car was entered by A. W. Paul, an amateur owner and driver, and the Chadwick makers knew nothing of his entry and victory until he wired them concerning it as follows: "My Chadwick won hill-climb race to-day at Wheeling in 2:42½; White steamer driven by Paul Melchert finishing second." The event was the principal one on the club program for the day and was held on Campbell's Hill, which is a stiff and winding grade of 1 1-3 miles. By finishing first Mr. Paul and his Chadwick become the possessors of the silver trophy offered by the club.

Continentals in Australia.—Word comes from the home factory of the Continental Caoutchouc Company, Hanover, Germany, that word has been received there of a trip across Queensland, Australia, by the Hon. J. W. Blair in a Panhard equipped with Continental tires. These were 150 mm. rear and 125 mm. front, and although the roads, where there are any, are extremely rough, the tires came through the 3,000-mile trip with but little perceptible wear, no replacements having been found necessary throughout the entire distance, over stretches never seen by an auto.

Big Carbureter Contract.—F. H. Wheeler, of Wheeler & Schebler, manufacturers of the Schebler carbureter, recently closed a contract with the Buick Company, of Flint, Mich., for 21,000 carbureters for the Buick 1909 product.

Field for Large Cars.—"There is still a large field to be filled by automobiles of the pleasure car type, and it is a mistake to think that the demand has nearly reached its limits," says James Joyce, manager of the American Locomotive Company's automobile department. "There is a demand of remarkable proportions for low-priced cars from persons who never owned a car before, and there is still an astonishing number of well-to-do persons who have not yet joined the ranks of the automobilists. Many of the latter will have nothing less than the very best when they get ready to buy, and the demand from them for cars of distinctively high quality will be added to that steady demand for cars of the exclusive class which comes from those who have had from one to four years' experience with various grades of cars, and have learned the economy of buying what costs least to maintain regardless of the initial price."

Shock Absorbers en Tour.—The "Shock Absorbers," a band of Philadelphia automobile writers, will journey to the Vanderbilt elimination trials in October in a White steam opera 'bus, camping out on the road. They will carry a tent and a chef, with a full commissary department, and will be delightfully independent of the grasping Long Islanders. All will be dressed in white suits, caps and neckties, and the car will be dubbed "The Water Wagon." The party will include Harry Lasher, E. K. Gilchrist, Jack Hiscock, H. McK. White, Richard Kain, John A. Cleary, E. H. Leach, George W. Daly, W. Blackman, Clyde Woolson, Robert Turner, H. W. Sharp, I. C. Minford and Harry J. DeBear.

Maxim's Noiseless Gun Tested.—Official tests of Hiram Percy Maxim's new noiseless rifle were made at Springfield, Mass., a few days ago, and showed that while the ordinary rifle could be heard 3 1-4 miles away, the Maxim rifle's only indication of its presence was a mere click, not distinguishable further than 1,500 yards away. The tests were made at the "Sixteen Acres" range, under the supervision of Major Kenneth Morgan, U. S. A., and proved very satisfactory.

Where Prominence Has Its Drawbacks.—"It must be very fine to so predominate in your field of manufacturing that when anybody thinks of a 'steam car' they think of the White," said a prominent gasoline car manufacturer a few days ago to Windsor T. White, president of The White Company. "It *is* a fine thing, and yet there are times when we wish that the public would keep in mind that there are other makes of steam cars," replied Mr. White. "As you well know, in the early days of the industry, a lot of steam automobiles with ordinary boilers were built by incompetent people. Most of these cars, of course, went to the scrap-heap long ago. But every once in a while some one digs up one of these obsolete steamers and fixes it so that it will run. Sooner or later—generally sooner—something happens to this 'steam automobile,' and we are more than likely to get the discredit for it. For example, about two weeks ago an old Geneva steamer blew up near Painsville, O., with disastrous results. The published reports of the accident spoke of a 'steam machine blowing up,' and some people who do not know our car and who, therefore, do not realize that such a thing is an absolute impossibility with the White, thought that one of our machines was involved. If these people had given any thought to the old crude steam cars, they would undoubtedly have placed the blame where it belongs."

Bretton Woods, N. H., Garage.—With the exception of the garage in Boston which was made from the old depot of the Boston & Albany Railroad, the establishment at Bretton Woods is said to have the greatest amount of floor space that any establishment of the kind in the country can boast, while it is said that its daily business is equal to that of the largest metropolitan garages. With its 30-foot aisle, extending 220 feet from door to door, and its two long lines of cars in their "stalls" against each wall, the garage is a sight for the curious, as the cars are constantly coming in and out. In the rear there is a 55 by 60-foot machine shop.

Minnesota Road Law Void.—The Minnesota Supreme Court has declared the county superintendent of highways law, enacted in 1907, unconstitutional, on the ground that it is not general legislation, as it applies only to counties of under 200,000 population. This law abolished the system of road supervisors selected by township and county boards, and provided for the appointment of county superintendents at a proper compensation. Experts had been appointed in many counties, and systematic road improvement was being undertaken. Steps will be taken at once to frame a new law.

Another Parts Maker.—The McCue Company of Hartford, Conn., which has been building gears and work in the white for the wholesale carriage trade for fifteen years, is adding automobile parts to its line. It will supply everything which enters into the construction of an automobile, including all kinds of forgings, brake and control levers, hubs, hearings, I-beam front axles, and floating type rear axles.

Touring in California.—The California Promotion Committee is prepared to supply, without cost, to all persons interested in California, and who intend at some time to make an automobile trip in that state, full particulars of the routes, with photographs, maps, guides, and other valuable information. A line to the committee at its headquarters, California Building, Union Square, San Francisco, is all that is necessary to receive it by return mail.

The New York Home of the Gyroscope.

Gyroscope to Race.—The first entries for the light car race at Savannah were made last week by the Gyroscope Automobile Company, through A. L. Kull, the general manager. This will be the first appearance of the Gyroscope cars in the racing field, but it is claimed that they have a valuable feature for this work in the gyroscopic action of the flywheel, which enables them to round corners at high speed. The photograph shows the Gyroscope's New York home, 231 West Fifty-fourth Street.

An International Auto Paper.—Such is *La Voiturette*, published in Paris by Georges Dupuy. As its name implies, it is specially devoted to the interests of owners of runabouts and light touring cars, and its articles, whether technical, descriptive or humorous, are written by the best authorities and are very interesting. It contains a section in English, which is highly appreciated by English and American tourists in France. The offices of *La Voiturette* are located at 78 Rue Charles Laffitte, Neuilly-Paris.

The Suggestion System.—In order to make it easy for the employees to give the company the benefit of their ideas, the Chalmers-Detroit Company has inaugurated a suggestion bureau in its factory. A number of small registers, such as are used in many stores for making duplicate copies of bills, have been placed in convenient positions, and the employees are invited to write on these any suggestions they may wish to make regarding the work they are doing. Prizes are awarded quarterly for the best suggestions.

Gramm-Logan Makes Announcement.—The Gramm-Logan Motor Car Company, the formation of which was announced last week, announces that it is located at Bowling Green, Ohio, a few miles south of Toledo, affording excellent shipping facilities. J. B. Wilson, a man of great business experience, is president of the company; B. A. Gramm, formerly of the Logan Motor Car Company, is vice-president and general manager, and Fred Bisantz, superintendent.

Dog-Hunting by Auto.—Henry Mower, the stray dog commissioner of Worcester, Mass., was badly rushed with his work last week. The accumulation of jobs in various parts of the city looked hopeless until he had the bright idea of obtaining an auto. The way he is now chasing around the city and mowing down the long list of delinquent dog-tax payers is creating a commotion in the city treasurer's office.

Campaigning in Auto.—Governor Fred M. Warner, of Michigan, who is making a vigorous campaign for reëlection, uses a Jackson automobile to carry him to the towns where he is due to make speeches. During the past two months he has covered thousands of miles in this way and has made addresses in hundreds of towns and villages which he could not possibly have reached in the same length of time by any other means of conveyance. Mrs. Warner and Lieutenant-Governor Kelley frequently accompany him. The Governor has no fear of prejudicing the farmers by his use of the automobile, as many of the country people in the State own cars.

Quick Mail Delivery.—From Suffield, in the Connecticut tobacco belt, comes the news of a wide-awake rural mail carrier who has given up horses for the more speedy automobile. The carrier is himself a tobacco cultivator and he claims that the automobile saves him three hours, which he is enabled to devote to the cultivation of the "weed." He says it costs him just eighteen cents a day to operate the automobile, and horses cost him a dollar.

Goodrich New York Headquarters.—The B. F. Goodrich Company, Akron, O., will shortly erect a six-story building in New York City exclusively for its metropolitan headquarters. The site at 1776-1778 Broadway, now covered by the buildings occupied by the Stoddard-Dayton, Renault and Ajax-Grieb agencies, has been acquired, and the buildings themselves will be torn down to make way for a new structure erected especially for the purposes of the tire makers.

TRADE PUBLICATIONS

Chalmers-Detroit Motor Company, Detroit, Mich.—This company's 1909 catalog is a neat and business-like booklet, without any exaggerated "fine language," but crammed full of just the kind of information the average buyer wants. The first and larger part is devoted to the new Chalmers-Detroit 30, which has created such a sensation in the trade. A brief explanation of the company's policy for the coming year, and of their purpose in bringing out the car, is followed by a thorough and painstaking description, not too technical, and illustrated by a profusion of views of the motor, gears, and chassis from every possible position. The part of the catalog describing the Chalmers-Detroit 40 is not so detailed, as this car is practically unchanged from last year, and the company expects that the reputation the car has already acquired will be sufficient to sell the output.

R. I. V. Company, New York.—R. I. V. ball bearings form the subject of a handsome catalog issued by this company, which holds the American agency. These bearings are of the radial type, but are distinguished by the means used to separate the balls—a ring of anti-friction metal cast around them after they are arranged in their proper positions. The catalog contains a complete list of the different types and sizes of the bearings, and their dimensions, loads and prices, and also drawings showing various applications.

Michigan Automobile Company, Ltd, Kalamazoo, Mich.—A neat little booklet comes from this company describing their planetary transmissions for automobiles. These gears are made in two sizes, for either shaft or chain drive. The planetary pinions are arranged on the well-known Ball system, with a triple-plate type of high speed clutch, cast iron against fiber. The smaller size is especially adapted to high wheel buggy autos.

IN AND ABOUT THE AGENCIES.

Cadillac.—Brown & Underwood, New Haven, Conn., agents for the Cadillac, will move into their new quarters at Broadway and Dixwell avenue about October 1.

Chalmers-Detroit.—D. B. Dey and O. T. Fenton have formed a partnership and will represent the Chalmers-Detroit line in Hightstown, N. J.

Continental.—The Continental Caoutchouc Company is about to open an agency in Los Angeles, Cal., which will be placed in charge of E. L. De Camp.

Havoline Oil.—T. E. Tomlinson, the secretary and general manager of the Havoline Oil Company, reports that he has made arrangements with W. P. Fuller & Co., of San Francisco, to take the agency of Havoline oil on the Pacific Coast, and in the Hawaiian Islands.

Studebaker.—The Studebaker Brother Company has just acquired a piece of property at the corner of Alden and Chapman streets, Portland, Ore., and will immediately begin the erection of a brick garage.

White.—An agency of the White Company has just been established in San Diego, Cal. It is under the management of Earl Pfiefer.

PERSONAL TRADE MENTION.

F. D. Stidham, for a number of years with the Cadillac Motor Car Company, Detroit, Mich., and recently the chief observer in the A. A. A. tour, has just been appointed manager of sales for the automobile and motor boat departments by Stanley & Patterson, 23 Murray street, New York City. Mr. Stidham will devote a large part of his time to the sale of the Patterson "Wireless" dry battery holder.

C. H. Smith—C. S. Calvert.—The Winton Motor Carriage Company has engaged G. H. Smith and C. S. Calvert to cover Eastern and Western territory, respectively. Mr. Smith was formerly Philadelphia manager for the White, and Mr. Calvert for years sold Wintons in Newark, N. J.

C. C. Crispen, who has been connected with the Pennsylvania Automobile Company for the past five years, has recently severed his connection with that concern. An announcement of his future plans will be made shortly.

George Arbuckle has been appointed appointed chief of the Winton supervisors by Sales Manager Churchill. Mr. Arbuckle has been on the Winton staff since 1902. company handles the Stoddard-Dayton.

George R. Moran, well known in the automobile industry, has accepted the position of sales manager of the Alamo Automobile Company, San Antonio, Tex. This company handles the Stoddard-Dayton for that territory.

H. Oscar Brown, formerly the Philadelphia agent of the American Locomotive Company, Providence, R. I., has joined the sales forces of the Bergdoll Motor Car Company in the Quaker City.

William Cadzow, formerly with the Wyckoff, Church and Partridge Company, has joined the Yonkers Auto Station, Yonkers, N. Y., Westchester county agent for the Stearns and the C. G. V.

W. J. Coghlan—C. A. Duerr.—Mr. Coghlan and Mr. Duerr are again associated as New York agents for the Moon. They formerly handled the Royal Tourist.

INFORMATION FOR BUYERS

Prest-O-Carbon Remover.—This is one of the latest specialties being introduced by the Prest-O-Lite Company, Indianapolis, Ind. The purpose of the preparation is to effect a thorough removal of all carbon from cylinder heads, pistons, valves and other parts without the usual labor of taking the engine down and scraping. The

TWO NEW "PRESTO" SPECIALTIES.

compression space of the cylinder is filled with the Carbon Remover, which is allowed to stand for 30 minutes, and is then removed. After this the motor is run with the spark retarded and the throttle wide open, and the carbon, which has been dissolved and loosened, is blown out the exhaust. The makers guarantee that a single treatment is sufficient to remove every particle of carbon. It does not contain kerosene, but is a new combination of chemicals, and may be used several times before losing its strength. It is applied with an oil gun and removed in the same manner. It is put up in gallon, half-gallon and quart cans. Another specialty just placed on the market by this company is the Prest-O-Lite instantaneous detachable tank band, which fastens with a hinged thumbscrew, so that the tank may be put on and taken off in a fraction of the time formerly required. The new band is sold at the same price as the old style, and may be had from any dealer handling the Prest-O-Lite line.

Gordon New England Tire Cover.—This is one of the many specialties manufactured by the Vehicle Apron & Hood Company, of Columbus, O. As shown by the accompanying illustration, it has been designed with a view to making the process of placing a tire in the cover or removing a tire from its cover a much shorter and more convenient operation than is the case with other methods of fastening. Snap fasteners are employed and they are placed on the cover in a position where they will come on the tread of the tire, thus affording a firm ground on which to press down in closing them. The tire in its cover may thus be laid down on or against any polished surface without any danger of marring it. Other specialties made by the same firm are the Gordon sleeve protectors, Gordon luggage carrier, or bag, Gordon automobile top hood, Gordon tire hands, Gordon automobile cape aprons and plain flat covers, also Gordon tool and inner tube cases and "fits all" lamp covers. All of these specialties are made of various grades of fabric and in a number of sizes to fit standard requirements.

GORDON TIRE COVER.

The Vacuum Muffler.—Although not differing outwardly from the usual type of muffler, the "Vacuum" made by J. A. and C. A. Xardell, of Utica, N. Y., is constructed on an entirely different principle. The interior is divided into two chambers; in the first the force of the exhaust is utilized in such a way as to create a partial vacuum, and in the second the noise of the explosions is muffled. The vacuum chamber acts to increase the freedom of the exhaust and clear the cylinder more completely of burnt gases. The mufflers are made in two sizes, for engines of above and below 15 horsepower.

Kempshall Non-Skid Tires.—This is a patented tire of English manufacture, for which Cryder & Company, Park avenue and Sixty-third street, are the American agents. As will be apparent from the accompanying illustration, its chief feature lies in the peculiarly formed tread which differs radically from anything of the kind previously brought out, and which is said to make this tire superior to the usual steel-studded type as a preventive of side-slip and skidding. The tire itself consists of seven layers of special fabric interposed between layers of

THE KEMPSHALL NON-SKID TREAD.

rubber, the manner in which the pile is firmly united into one integral whole being the subject of another of Mr. Kempshall's numerous patents. Owing to the increased amount of radiating surface, the Kempshall tire is said not to heat to the same extent as the ordinary type.

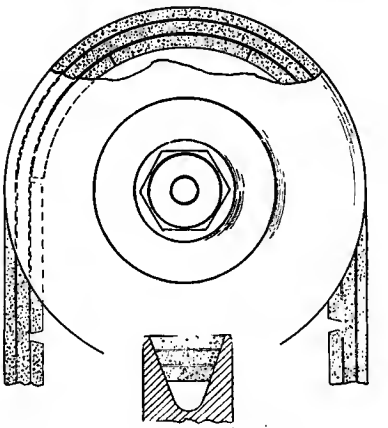
Front Springs for Fords.—As a means of improving the forward suspension of the Ford runabouts, the Special Motor Vehicle Company, 223 East Fourth street, Cincinnati, O., has just brought out what they term "Shumard's front springs for Ford runabouts." These are of the usual full elliptic pattern and are supplied complete with all the necessary fittings for placing on the car, while the makers also supply detailed instructions so that the majority of autoists who are able to handle simple tools will find the operation one that easily lies with the scope of their mechanical powers.

"Michigan" Planetary Gears.—These are the product of the Michigan Automobile Company, Ltd., Kalamazoo, Mich., and are designed for either chain or shaft drive. Type K is made for cars of 12 to 20 horsepower, while Type L is for lighter work, ranging from 6 to 12 horsepower, and is especially adapted to the use of the buggy type of car. Either is supplied with the sprocket next to the flange of the main shaft and the clutch cone on the opposite end, or vice versa. The gears can also be made to fit a desired location by providing different lengths of shaft, different sizes of flanges and also different sprockets. The Michigan company is licensed to manufacture planetary gears of this type under the Ball patents, and their specialty is turning out large quantities to manufacturers' specifications, their plant being particularly adapted to this purpose. They are also

POPULAR-PRICED PREST-O-LITE TANK.

large makers of special designs of transmissions, jackshafts, rear axles with chain or bevel gear drive, and a combination of these various parts, as well as sliding gear sets of the selective type. The company is also in a position to turn out gasoline motors of from one to six cylinders. Some of the details of the Type K planetary gear will be of interest. The main shaft is drop-forged from 35 to 40-point carbon open hearth steel of best quality, and is made integral with its flange. It is hardened, as is also the cone, made from machine steel, while the gears are turned out in the same manner, and are all bronze bushed; the clutch dogs are of hardened tool steel. The clutch plates are of steel, cast iron and red fiber; they are of good size and afford ample friction surface.

Challenge "V" Type Belt.—This is one of the products of S. F. Heath & Company, 288 Columbus avenue, Boston, Mass., and is specially offered for motorcycle and automobile use. They are made of specially selected hides, tanned by a secret process to produce the maximum tensile strength, and they are not only waterproof, but also resist the action of steam, oil, gases and alkalies to a remarkable extent. The permanent stretch of a Challenge belt in service is so little and their power of re-



HEATH'S CHALLENGE "V" TYPE BELT.

covering their normal tension when idle is so great that any slackness is usually taken up after a short rest, usually over night. As they are specially designed to prevent slipping, no idler is required. For the transmission of power on the motorcycle and for fan use on the auto the makers claim that they have no superior. The same company also supplies belts of the flat type, using the special Challenge leather.

VOL. XIX NEW YORK—THURSDAY, SEPTEMBER 3, 1908—CHICAGO No. 10

THE AUTOMOBILE

22 Winnipeggers Have an Endurance Run: 4 Perfect Scores

Start of the Annual Endurance Run of the Winnipeg Automobile Club, the Most Successful in Its History.

WINNIPEG, MAN., Aug. 25.—The Winnipeg Automobile Club's annual endurance run for 1908 took place from August 15 to 18, over an extremely trying course, 425 miles in length. Twenty-two cars were entered for the event, as follows:

Oldsmobile, J. Maw.	McLaughlin, Chas. Newton.
Oldsmobile, John Moran.	McLaughlin, R. McKenzie.
Oldsmobile, D. B. Sprague.	McLaughlin, W. Sweatman.
Oldsmobile, D. Glasgow.	McLaughlin, Harry Gooderham.
Oldsmobile, G. Walker.	McLaughlin, P. C. Hagarty.
Oldsmobile, T. Louden.	McLaughlin, W. Borebank.
Oldsmobile, G. A. Mitchell.	Russell, W. E. Wright.
Oldsmobile, F. Raynsford.	Russell, Canada Motor Co.
Packard, Mrs. E. Nicholson.	Royal Tourist, W. R. Bawlf.
Packard, Hon. Robt. Rogers.	Buick, E. Patterson.
Cadillac, Russell MacLeod.	Mitchell, F. R. Newman.

The different makes of cars represented being divided as follows: Packard, 2; Royal Tourist, 1; Russell, 2; McLaughlin, 6; Oldsmobile, 8; Mitchell, 1; Cadillac, 1; Buick, 1.

Four cars finished with an absolutely perfect score, they being:

Mrs. Nicholson's Packard.

Hon. Robt. Rogers's Packard.

W. E. Wright's Russell.

J. Maw's Oldsmobile.

The judges in making their award decided that these four cars should be asked to go through a further trial in order to decide the winner of the Oldsmobile trophy and the silver cup which goes to the car taking first place, and another cup presented for the second. This will in all probability be run off on September 5 and 6, the two days preceding the date fixed for the Dunlop trophy race, which is a speed event and is scheduled for September 7.

How the Tour Progressed from Start to Finish.

The twenty-two cars left Winnipeg at 8:40 A.M., August 15, the first day's run being to Brandon, distant 142 miles. All the cars made the trip without trouble except with tires, with the exception of G. Mitchell's Oldsmobile, which broke the hub gear on the driving wheel and was held up until a new wheel was obtained from Winnipeg, the car coming on after repairs had been made, rejoining the main body at Brandon on Sunday morning and finishing the tour without any further trouble. The route during the latter portion of Saturday's run was of a very trying nature, being of a very up-and-down character, the road surface being loose and sandy, making the work on the engines of an extremely arduous nature. Sunday was spent in Brandon, not being included in the tour proper.

Monday the start from Brandon was fixed for 8 o'clock sharp, and prompt to time all the cars were in position waiting for the pathfinder to get ahead of the main body. During the wait Mayor Clements of Brandon, accompanying A. W. Elliott of Brandon in his Chatham car, joined the tourists and a big Thomas touring car loaded with prominent citizens of Brandon was also in evidence for the purpose of escorting the tourists on the first twenty miles of the day's run.

Twenty-two miles from Brandon, the home of W. Carroll, M. P. P., "Father of the Manitoba Motor Act," was reached, and here the tourists met with a most hearty reception, which included refreshments. This act of courtesy was highly appreciated by the tourists, showing as it did the large-minded manner in which automobilists are treated by the farming class, of which Mr. Carroll is a most prominent figure. In fact, all through the tour the farmers along the route suspended their harvesting operations to cheer the tourists as they passed by.

Newton's McLaughlin came to grief between Minto and Boissevain, with a connecting rod seized, due to overheating, but the repair car with its excellent staff of mechanics managed to get him running again inside of five hours and both cars caught the crowd before the completion of the day's run.

There Were Numerous Receptions En-Route.

During the afternoon run receptions were the order of the day, nearly every town that was passed through having a reception committee on hand to welcome the tourists and invite them to participate in some form of entertainment, that at Killarney being to a trip on the beautiful lake by steamer, while at Pilot Mound a magnificent bouquet was presented to the lady in the leading car by the ladies of the town, and an excellent light supper provided for the whole party. The time lost

Mrs. E. Nicholson's Packard. One of the Perfect Scores.
Finished with a perfect score in Winnipeg Auto Club's 1908 Endurance Run for Olds trophy. This car left Winnipeg, August 25, for a tour from Winnipeg to New Orleans, going by road throughout.

on the running schedule caught the tourists in the dark with still twenty miles to cover, including a long climb of nearly two miles in length, the steepest part of the grade being about 1 in 7, with several sharp curves rendering the task of successfully negotiating the hill a matter of skilful driving to prevent stalling the engine. It is doubtful whether any of the hill climbs in the United States could compare with this particular hill for stiffness, and it is the intention of the Winnipeg Club to hold a hill climbing contest on this hill at an early date.

When the cars arrived at Larivere at 9:45 P.M. the townspeople had a huge bonfire lit in order to obtain a good view of the cars as they arrived, and the tourists were once more greeted with an address of welcome, which with the acknowledgment on behalf of the Winnipeg Club by President Russell MacLeod, delayed the run for another 20 minutes, making it past 11 o'clock before the night control at Manitou was reached. In spite of the late arrival the whole town was out waiting the arrival, and as the hotel accommodation was insufficient to meet the demand the citizens came to the rescue, the tourists being provided with sleeping accommodation in their homes.

The home run was fatal to the chances of quite a number of competitors owing to broken springs, W. R. Bawlf's Royal Tourist and Dr. Glasgow's Oldsmobile benig among those falling from this cause. The remainder of the run back to Winnipeg was covered without incident, beyond the decorating of each car with wheat sheaves obtained from a farm about 15 miles out.

Eighteen of the twenty-two cars finished at the *Free Press* office at 7:35 P.M., their arrival being welcomed by a big crowd.

POPE-HARTFORD LEADING WINNER MINNEAPOLIS CLIMB

MINNEAPOLIS, MINN., Aug. 30.—One distinct winner was evolved yesterday in the annual hill-climb of the Minneapolis Automobile Club, which is something unique in the annals of this style of motor competition and which at the same time will prevent many from making claims not borne out by facts. In doing this the "Gophers" used the Chicago Motor Club formula, which brings out motor efficiency, the handicap being based on piston area multiplied by time and divided by the weight of the car. Using this formula, the officials of the contest formally awarded the chief prize in the test, the Minneapolis *Journal* $1,000 trophy, to H. J. Clark, an amateur driver, whose 27.2-horsepower Pope-Harford showed best under the formula, its percentage figures of 3.53 being the lowest of the fifteen cars that competed in the bandicap events. As figured under the formula the cars were rated as follows:

Car.	H.P.	Driver.	Pct.
Pope-Hartford	27.2	H. J. Clark	3.53
Corbin	32.4	Gordon Bird	4.21
Buick	22	C. Nyquist	4.30
Buick	22	D. W. Onan	4.52
Overland	19.6	B. Fawkes	4.50
Stoddard-Dayton	36.1	A. C. Miller	4.73
Rambler	32.4	E. Sampson	4.90
Jackson	22	W. G. Benz	4.95
Ford	22.5	G. Dorr	5.09
Ford	22.5	W. E. Wheeler	5.18
Pierce-Arrow	60	P. Hofmann	5.50
Overland	19.6	L. Bousfield	5.84
Holsman	12.4	W. C. Rader	6.547
Schacht	14	H. B. Allen	6.599
Rambler	20	J. B. Lee, Jr.	7.44

Eight classes were provided for and in these there were twenty-four contestants. Four of them were handicap events and the others were decided on straight time, the results being as follows:

CLASS A, MOTOR BUGGIES, HANDICAP.

Car and driver.	Time.	Pct.
Holsman, W. C. Rader	:72	6.547
Schacht, H. B. Allen	:80.4	6.599

CLASS B, HANDICAP.

Buick, C. Nyquist	:44 2-5	
Buick, D. W. Onan	:46	4.52
Overland, B. Fawkes	:50	4.60
Jackson, W. G. Benz	:51 3-5	4.95
Ford, G. Dorr	:47	5.09
Ford, W. E. Wheeler	:49 4-5	5.18
Rambler, J. B. Lee, Jr.	:78 4-5	7.44

CLASS C, HANDICAP.

Pope-Hartford, H. J. Clark	:43 4-5	
Corbin, G. Bird	:33 2-5	4.21
Rambler, E. Simpson	:45 4-5	4.90

CLASS D, HANDICAP.

Stoddard-Dayton, A. C. Miller	:35	4.73

CLASS E, HANDICAP.

Pierce-Arrow, P. Hofmann	:37	5.50

CLASS F, FREE-FOR-ALL.

Pierce-Arrow, P. Hofmann	:38 3-5

CLASS G, FREE-FOR-ALL.

Corbin, G. Bird	:33 2-5
Stoddard-Dayton, A. C. Miller	:35

CLASS H, HANDICAP.

Pope-Hartford, H. J. Clark	:43	3.47
Overland, L. Bousfield	:64	5.84

CLASS I. FREE-FOR-ALL.

Moon, G. H. Seeley	:47
Rambler, J. B. Lee, Jr.	:81 4-5

OPEN RUN AROUND LONG ISLAND TO TEST STOCK CARS

BY way of demonstrating the running qualities and mechanical efficiency of fully equipped stock cars of the various models that may be entered, the New York Automobile Trade Association is to promote Wednesday and Thursday, September 16-17, a combined road test and pleasure run around Long Island.

Roughly estimated, the two days' tour will cover some 275 miles. The first day the course will be along the south shore of the island, with a noonday clambake at Blue Point and a mammoth ox roast at Montauk Point, the night stop. On the return trip the caravan will cross to the north shore from Good Ground and stop for luncheon at Riverhead.

The cars will be divided into six price classes, with an added class for taxicabs carrying two passengers and a driver. The classification will be: Class A, $850 or less; class B, $851 to $1,250; class C, $1,251 to $2,000; class D, $2,001 to $3,000; class E, $3,001 to $4,000, and class F, $4,000 and over. The taxicabs will be grouped under class G. The classes will be further subdivided according to their passenger-carrying and load capacity. There will be a liberal time schedule and time limit.

The management of the run has been placed in the hands of W. J. Morgan and the working out of the technical details has been entrusted to Alex. Schwalbach, who as secretary may be addressed at the Thoroughfare Building, Broadway and Fifty-seventh street.

OVER THE ALLEGHENIES FOR A FAST TRY-OUT

By A MODERN TRAVELER.

LAST Thursday it took S. D. Waldon just 15 hours 58 minutes to drive a 1909 Packard car from Pittsburg to Philadelphia, thereby smashing the automobile record between those cities by a couple of hours. A generation past it took the rolling, jolting stage coach fifteen to twenty days to make this same 304-mile journey over the Alleghenies.

Times have changed and travel has changed, but the old Forbes military road, built more than a century ago across Pennsylvania, has changed but little. The wildly curveting stage, hitting the high spots as it bumped roughly and recklessly over the mountains, is merely a dim recollection. The road itself is coming back into its own.
